# THE ARCHITECT

## A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

### THE WEEK.

THE *Publishers' Circular* indicates fairly the state of trade in general. During 1884 there was a slight increase in the number of books over the year preceding. The new books were one hundred more. It is remarkable that the largest increase has been among books on the arts and sciences and illustrated books. Last year there were 432 new books of that class, and 159 new editions. In 1883 the numbers were 354 and 137. The classes of books which have fallen in quantity are juvenile books, *belles-lettres*, and essays.

M. IDRAC, the sculptor, died of typhoid fever on Sunday last in Paris, and a fine career has thus been cut short. Although he was only in his thirty-fifth year, M. IDRAC had, by his works, gained the distinction of the Legion of Honour. He was one of the winners of the Prix de Rome. At the time of his death he was engaged on a statue of ETIENNE MARCEL for the new Hôtel de Ville. The commission was obtained by competition. Among other works by him were figures of SALAMBO and MERCURY. It is only a year since M. IDRAC was married to Mdle. BALLU, a daughter of the distinguished architect.

THE condition of labour in the United States is exciting quite as much grumbling as is heard in England. In many trades the workmen are complaining that they are overworked and underpaid, and that "piece work" is ruinous in most instances, as the men injure their constitutions for a big day's pay. An employer is tempted to reduce the price, and the workman is obliged to do the same amount of labour for smaller pay, his wages being measured by what he can be forced to do, and not by the value of the work performed. The brickmakers in the Philadelphia district claim that great injustice is done them by hiring men, say at 15 dollars to 40 dollars per month—few getting the latter figure—and exacting a certain amount of labour per day; and should they break down in the middle of the month, they lose what they have actually earned, getting no pay for what they have done. If ill they are charged 75 cents for board, and that of the cheapest kind. An American foreman who has been employed in erecting some patent furnaces in England has stated that from what he saw the English working people are better clad than those in America; that they live quite as well, but more economically; that they are far more independent, are better organised, have more holidays, and seem to be better contented.

THE exhibition at Antwerp, which is to be held this year, is likely to be attractive if the proposed plan is carried out of decorating the different sections in a style that will be suggestive of nationality. But what is the English national style, unless the mode that is now in favour is accepted? A Mediæval style will be adopted by Austria, and among the exhibits will be some splendid specimens of ironwork belonging to the Emperor. The French, who are proud of their African conquests, propose to bring over fifty families from the West Coast. The area, which is to

be lighted by the aid of electricity, will be over 114,000 square metres. About 18,000 square metres will be occupied by France, and 30,000 by Belgium.

ALTHOUGH there is exceptional dulness in the trade of Paris, the members of the Municipal Council have been true to their traditions by voting, on Sunday last, the sum of 300,000 francs, which is to be expended on the purchase of works of art during the present year. When will their example be followed in England? By their annual purchases of pictures and statues the Council uphold an interest in art which is not to be measured by their outlay. Artists are brought into notice through means of the vote, and the public are excited to purchase quickly, in order that they may not be forestalled by the municipality.

MR. JOHN FRASER, jun., of the Aberdeen Granite Works, died on Monday last, at the early age of thirty-five. He was well known among architects and builders as the representative of the firm of JOHN FRASER & SON. Many large contracts had been entrusted to him, one of the latest being the supply of granite for the new Stock Exchange, London, of which Mr. COLE is architect.

It is generally admitted that no artist in Paris is better fitted to undertake a subject relating to what may be called Early Mediævalism than M. J. P. LAURENS, whose *Death of St. Geneviève* is one of the most remarkable works in the Pantheon. Being fascinated by THIERRY'S *Temps Mérovingiens*, he prepared several drawings in black and white to illustrate that history. They displayed the painter's tragic power, and that painstaking manner which M. LAURENS never abandons even when making outlines to be copied. The designs have been reproduced by the photogravure process, and are considered to be the most attractive of this season's publications in Paris. An English publisher who had the enterprise to give M. LAURENS a commission for an illustrated edition of "Macbeth" or "Hamlet" would be well repaid.

THE diaries of Messrs. HUDSON & KEARNS for the new year are marked, as usual, by solicitude to give information that is likely to be required in architects' offices. The summary of cases which have been decided during the past year is a useful addition, and presents many points of interest. Thus, under the head of "Contract," we note that, in an offer by telegram, "all the terms offered must appear to be included on the face of an acceptance. An acceptance by letter to an offer by telegram may justify the withdrawal, as being evidence of unreasonable delay, it being presumed that a prompt reply is expected." We are also informed that, under the Employers' Liability Act, "an injury arising from a defect in a ladder borrowed by order of the foreman does not fall within the Act"; and that in another case it was laid down that the master must be cognisant and the servant ignorant of the danger to establish a claim. Suggestions like the preceding will often be found useful.

## THE BUILDING TRADE.

IT is inevitable that with the commencement of a year men of business should consider their prospects, and if ever thought was needful it is at the present time in England. From every part of the country complaints are heard about the scarcity of orders, and the efforts which are made by foreigners to carry off those which are likely to be profitable. The correspondence of English representatives abroad is filled with doleful pictures about the state of trade, and it would seem as if there was an almost universal agreement among one class of men to ruin the other class. The shrewdest political economists are unable to point out any new impediment to business. There are the same reciprocal wants and the same means to satisfy them. In fact, the conditions in things and in himself which have made man an animal that exchanges are still in a normal state. The earth is as productive as ever, there are no plagues, war is confined to a limited part of the globe, and the amount of specie is larger than before.

Is it any exaggeration to suggest that the evil is in a great measure a result of imagination which has been exercised through insufficient knowledge? But as there are physical epidemics, there seems no reason why there should not be others of a mental kind, and as money is the prime mover of modern life, it is not absurd to suppose that the visitation (if it be one) should be inseparably connected with finance. In primitive bartering, buyers and sellers knew one another, and saw the articles which passed between them. Modern trade, on the contrary, is deprived of tests of that kind. Credit is akin to credibility, or in other words, to trust, which is based on qualities which are created by imagination. What can a shareholder in a bank or a company know of the uses which are made of his money unless his imagination comes to his aid?

With a country like England, which has become a creditor for all, there must be a constant liability to panics. A failure in Australia or Shanghai or San Francisco is felt in Lombard Street. Losses are magnified by distance, and speculators who one day dreamt of impossible profits, and are willing to put everything to hazard, will, on the next, become doubtful of the Three per Cents. Take, for example, what occurred so near as Glasgow, and see how it has affected the building trade all over the country. A great many buildings were erected in that city on money which had been advanced by one or more of the local banks. It is not at all certain that the buildings were needless. If the bank had not collapsed through bad management, leaving many of the buildings incomplete, it is possible that purchasers would be found for them. But the cavernous blocks were all that remained, and they were transformed into a standing warning against the wiles of architects and builders. If a man in Devonshire wished to invest a part of his spare capital in houses or shops, a good-natured friend was sure to be found who pointed out the example of Glasgow. The profits which have been derived from building in every town counted for nothing beside that dismal failure. The true state of the case was never stated, and if it had been it would hardly be credited among the shrewd men of Glasgow. Their minds were inflamed, and a profit and loss account assumed a portentous aspect.

It is owing to a similar cause that railway enterprise is still affected by the failure of OVEREND & GURNEY'S bank. The managers of that concern advanced money on conditions that would be absurd to any pupil in a building surveyor's office. The most venturesome building society would not advance money so unwisely. The bankers knew nothing about the cost of earthwork and masonry, and they imagined that, if enormous prices were entered in a schedule for labour, there must be corresponding profits. Money was accordingly almost forced on contractors, lines were projected in the hope of advances from the bank, and everyone remembers the result. Shareholders suffered, and a prejudice against engineering work was created which will not be easily dispelled. When there is speculation of that kind, which was as wild as any transactions in a lunatic asylum, it is not surprising that there are periodical crises. A political economist like the late Dr. JEVONS could find no satisfactory cause for them nearer than the sun, and he was able to demonstrate to the satisfaction of mathematicians

that the sun-spots were responsible for the periodical depressions under which trade suffers. But to plain men the freaks of a succession of OVERENDS and GURNEYS and of their dupes will appear to be a more rational explanation.

It is not our purpose to propose a remedy that will make trade in general prosperous. So long as the world has to trust to imagination for a guide, crises will arise. If one company becomes successful it creates several others, until a loss brings distrust; it is followed by a period of depression, then there is one of recovery, and so the movement continues in perpetual ebbs and flows. But there is no reason why building should be put on the same level with projects which are concerned with the problematic existence of a vein of metal several hundred yards under ground in some out-of-the-way place in Central America, of which nobody ever heard before the name appeared in a prospectus. If any man will use his own reason he can discover for himself how far building is a venture. It is absurd to suppose that an English town is over-built. A speculator, who believes himself to have more foresight than any architect of his acquaintance, can erect a palace in a noisome district where no one dwells who can go elsewhere. But follies of that kind should not be taken as tests of building investments. With ordinary care buildings can be made to return a sum that is proportionate to their importance as an enduring security. They have also the advantage of coming more under the control of investors than any railway, say in Java, could well become, and are less liable to the risks of competition from unexpected quarters.

If considerations of this kind are urged on people, they are likely to refer not to their own town, but to Paris or to Glasgow, as evidence that in regard to building it is very easy for the supply to be in excess of the demand. Neither case is apposite. In Glasgow, as we have said, a great many unfinished houses were abandoned at a time when everybody was distrustful of his neighbour's solvency. Paris should never be taken as a test, for building is very often conducted there in defiance of political economy, and the buildings are like the relief works in Lancashire and elsewhere, undertaken with a view to escape the consequences of enforced idleness in places where wealth becomes a temptation. In the same way it will be found that in the majority of instances where building has been found unprofitable, some other cause has been at work besides the costliness of the construction. Indeed it may be affirmed that, if everything be taken into account, building in England is one of the safest and most profitable means of investment.

English people cannot fail to understand their own interests, and it is safe to predict that in a little time there will be a better appreciation of this form of security. But, from a financier's point of view, building may be said to have more difficulties opposed to it than any other kind of enterprise. Capital is always affected by the slightest imputations, and a groundless rumour has often destroyed the prospects of a company. At the present time there is a perpetual publication of imputations against English buildings. Every man who writes a letter to a newspaper about a leakage in a drain or in gas-tubing, or asks the public to sympathise with his sufferings from a smoky chimney, creates distrust, and wherever distrust exists there must be hesitation in dealing with capital. If the same tactics had been adopted in regard to railways or waterworks or mines, the lists of the Stock Exchange would show a very different value for some of the shares that are in constant request. What is most needed at the present time is the creation of confidence in building, and towards that creation every architect and builder can do something.

---

**The Street Memorial.**—The memorial to the late Mr. Street, R.A., is in course of erection in the central hall of the Royal Courts of Justice. It consists of a statue, surmounted by a canopy. The memorial will be erected in the second bay of the central hall, on the right-hand side entering from the Strand. The sculpture is by Mr. H. H. Armstead, R.A., and the memorial has been designed by Mr. A. W. Blomfield, M.A.

## M. MAILLART.

[BY A CORRESPONDENT.]

THE art-world of Paris has its Olympus, but the deities are not immortal. DAVID, GÉRICAUT, LAFOND, DROLLING, INGRES, are among those who have had fervent votaries, but whose cult has died out. At present the only representative of Olympus that commands respect is EUGÈNE DELACROIX. The youngest painter would hardly wish to become like unto him, for it is too clear that philistine patrons are shy of experiments in colour, but in every studio there is a firm belief that if that artist had put forth all his powers he could have surpassed any of the great Italians. TITIAN, it is held, was not so expressive in colour, while his field was more limited. DELACROIX, according to his worshippers, was the BYRON of painting. While there was sunshine around his head there was a storm in his breast, and the struggle between light and darkness is evident in his works. He was equal to undertaking every scene in the tragedy or comedy of life, and passed, as a devotee says, "from saints to warriors, from warriors to lovers, from lovers to tigers, and from tigers to flowers." It is not necessary to inquire whether a painter ever stands before a picture of DELACROIX when he is in a difficulty. What worship is there on earth that can be said to be perfect? But among artists, and especially those who inhabit that district in Paris which lies between the Quai Malaquais and the Boulevard du Mont Parnasse, if words could be taken as a test, EUGÈNE DELACROIX might be considered as having reached a throne near the summit of the Sacred Hill.

If any of our readers should be inspired by a hero worship with DELACROIX for its object, they may be induced, like the writer, to make a pilgrimage to the studio that has been rendered sacred by the presence of the great painter. If they have that intention, it would be well, in the first place, to take a look at the studios and residences which have been erected of late years in the neighbourhood of the Parc de Monceau, and if they are able to discover the prices of the buildings so much the better. Then let them drive to the quaint old square, called the Rue de Furstemberg, where DELACROIX dwelt and painted, and they cannot fail to be impressed with the difference between the conditions which surround art in our time, and those which prevailed when LOUIS PHILIPPE was king. The modern painter has to take up his abode in a fashionable quarter. DELACROIX preferred a place, which, although enclosed by houses and approached by narrow streets, still retains the quiet which befits ground that formerly was within the walls of the Abbaye St.-Germain, and preserves the name of a cardinal who was abbot. His studio will be discovered in a secluded corner of the square, and the pilgrim will be greeted with kindness by its present owner, a painter who has also attained fame, Monsieur DIOGÈNE ULYSSE NAPOLEON MAILLART.

If the history of a house is worth anything, if walls can be suggestive of scenes or thoughts, then there ought to be inspiration in this *appartement*. Fortunately there is nothing seen which will divert the thoughts from painting. Japanese and other knick-knackery have their uses, but here they would dispel the associations. We see none of those surroundings which are often suggestive of theatricalism. The anteroom is pervaded by an air of comfort that is not everywhere felt in Paris, and the studio is a workroom rather than a cabinet of curiosities. Around paintings will be seen in various stages of progress, and the visitor, if he has had much acquaintance with studios, cannot fail to be impressed with the remarkable versatility of the artist. It would be difficult to say what is M. MAILLART's speciality. He paints classical subjects, scenes from Mediæval history, revolutionary episodes, *genre*, portraits, idylls, scripture pieces; he has illustrated SCOTT's novels, and executed immense decorative works; with apparently equal delight to himself he can represent a scene from HOMER or from a child's story-book. M. MAILLART is a professor at the Gobelins, and, to hear him talk, a stranger would think that his life was devoted to the history of art in relation to textiles. But at the Gobelins he had M. CHEVREUL for associate, and OWEN JONES was never more of the *savant*

than M. MAILLART in explaining that chemist's theory of the simultaneous contrast of colours, and in laying down the laws which should govern the use of colours in all things from frescoes to bonnets. How was so much knowledge acquired? A brief *résumé* of the artist's life will answer the question.

In December 1858, a peasant youth of about eighteen and his father stopped at a humble inn at the outskirts of Paris. That youth is now M. MAILLART, the painter and professor. In the village school he drew better than other children, and it was proposed to make a tapestry weaver of him. After a trial it was suggested that Paris was a more promising field for so much ability, and accordingly M. MAILLART *père* left his work, and brought his son in a wagon to the capital. There must have been many sacrifices in the peasant's hut to find means to pay the expenses of the experiment; but, so poor was he, it was difficult for young MAILLART to discover a school that would suit his purse. At last he entered one in the Rue de l'Ecole Médicine, which is not far from his present residence. With pardonable pride he displayed his copies of woodcuts and the smooth lithographs of JULLIEN, and, in consequence, he found himself placed in the elementary class amongst children of eight. He took the rebuff in a right spirit, endeavoured to unlearn what he had taught himself, and in less than four months his place was in the first division. He was advised to enter the Ecole des Beaux-Arts, and gained the fourth place amongst the crowd of competitors for admission.

In the latter school he was fortunate in being noticed by LEON COGNIET, an artist who had been a benefactor to many a struggling youth. COGNIET appealed to the authorities of the department of Oise on behalf of MAILLART, on whom in consequence a pension of five hundred francs was bestowed. Twenty pounds a year is not much of an allowance, but, with youth and art for companions, many men have contrived to be happy on it, and some, like BÉRANGER, would give the remnant of their life for one of the days "dans un grenier qu'on est bien à vingt ans!" In spite of his twenty pounds, MAILLART was unable to pay the fee of twenty-five francs a month that was required from students in COGNIET's *atelier*, and with characteristic pride he declined to accept the invitation of the old master. It was only by a kind force that his scruples were overcome; but, after six months' attendance, COGNIET's *atelier* was unfortunately closed, and young MAILLART became an assistant to M. CORNU.

M. MAILLART had early gained a prominent place among the students in the Ecole des Beaux-Arts. In 1863 he was advised to try for the Prix de Rome, but was unsuccessful. The year following he carried off the coveted prize, as was predicted by his rivals, among whom were the late LOUIS LOIR and M. J. P. LAURENS. The subject of the painting was taken from one of ANDRÉ CHÉNIER's poems, and represented HOMER fallen by the wayside and protected against savage dogs by three young shepherds. When M. MAILLART arrived in Rome the French school was directed by M. SCHNETZ, then eighty years old, if not more. It is the custom that every new-comer in the Villa Medicis should be initiated by the student whose term has nearly expired, and thus M. MAILLART became the *clou* to the late BENJAMIN ULMANN. His companion was DESCHAMPS, the sculptor, whose early death was generally deplored, and M. MAILLART, who possesses a splendid head and vigorous physique, often posed for the *Discobolus*, the work by which his friend will be remembered. It is now in the Lyons Museum. An attack of Roman fever drove M. MAILLART to Naples, and then to France. During his term he was also able to spend three months in Venice.

M. MAILLART has acknowledged that on his first sight of their works he was not impressed so much by MICHEL ANGELO and RAPHAEL as he had anticipated. The experience of Sir JOSHUA REYNOLDS was of the same kind, for he tells us that he was abashed when he found that his ignorance prevented him from realising the masterpieces of art. The first picture that attracted M. MAILLART was the *Deposition*, in the Vatican Gallery, the chief work of CARAVAGGIO, and one of the best examples of the School of the Naturalists. It was carefully copied by M. MAILLART, and inspired by it he painted a figure of *Samson*, which was to serve for his first year's *envoi*. In 1866 he sketched his

*Helot*, which was afterwards completed as a picture. It was among the works which were chosen to uphold the fame of French art at the Vienna Exhibition, and was awarded one of the forty medals. It is now in the Museum of Carcassonne. This picture is most pathetic. A young helot is seen chained to one of the primitive stone mills, which he has to turn. Overcome by fatigue he is seated on the base, one hand resting on the beam, while the manacled arm hangs across it. The lassitude of the figure suggests oppressive toil, to which mind, as well as body, has succumbed. In contrast with this forlorn man is a delightful group of a shepherd, with his wife and child, returning from the field, the woman resting against the man, while the child is held astride on the crook. Although passing near the slave they are as indifferent to him as if he were a grain of dust. The picture suggests the dark side of Greek life, and appeals at once to the sympathy of the spectator. One of the *envois* which every prizeman has to prepare is a copy of a painting by a great master. The work selected by M. MAILLART was TITIAN'S *Peter Martyr*, in SS. Giovanni e Paolo, Venice, but he had scarcely set all his scaffolding when the picture and other works were destroyed in the fire of 1867. CORREGGIO'S *Saint Gerome*, in Parma, was afterwards substituted as the *envoi*. His last work as a student was a large work, *Moses and the Brazen Serpent*, containing more than fifty figures, and in which the influence of MICHEL ANGELO was seen. It was exhibited at the Salon, 1870, and some of the jurymen considered it deserving of the Médaille d'Honneur for the year. Afterwards it was purchased by the Government and was placed in a chapel in the Tuileries, where it was destroyed by the Commune.

M. MAILLART was, at the instance of M. CHARLES BLANC, appointed Professor at the Gobelins in 1872, and his pupils have been remarkably successful. In consequence of his reputation he was afterwards elected one of the jury of the Ecole des Beaux-Arts, including sometimes the competition for the Prix de Rome. It would occupy too much space if we attempted to describe all the large pictures which have been produced by M. MAILLART since his return from Rome. The titles of some of those which were exhibited in the Salon will indicate their character, viz.:—*La Néréide, Le Héros tueur de monstres, Baptême de Saint Augustin, Rimembranza, Thétis armant Achille, Manon Lescaut, Le Héros et le Poète, La Mort de Sainte Monique, L'Amour berger, Le Jugement de Paris, La Mise aux fers de Prométhée, Etienne Marcel et la Grande Ordonnance de 1397*. The artist's preference would thus appear to be towards subjects which are taken from Greek mythology and poetry. It is a wide circle of art which comprises DAPHNIS and CHLOÉ, ACHILLES and the blind HOMER, and M. MAILLART has traversed it successfully. A word should be said, however, about his portraits. One of Madame MAILLART, representing that lady seated at the foot of a tree, in an orchard, attracted much attention in the Salon of 1873, and was honoured by a second medal. Since then commissions for portraits have been forced on the artist, including those of many celebrities. The Americans in Paris have been among M. MAILLART'S patrons. The only works which the painter had time to complete for the Salon of 1884 were two portraits, one being of the French General, Count DE CLERMONT-TONNERRE.

From our brief sketch it will be evident that M. MAILLART is an example of courageous perseverance in overcoming obstacles. A student of the Ecole des Beaux-Arts, a Prix de Rome, he feels that it is incumbent on him to uphold the principles of French art. If M. MAILLART had to be described by an Englishman who did not know him as a painter, he would be said to be "a man with a backbone," and his career corresponds with his appearance. Fashion has had its influence on French art as on other things, and it is not difficult to gain money by veering with the times. M. MAILLART, while avoiding the stiffness that suggests only the posed model, has shown that in the slightest work it is possible to preserve the influence of the great masters. In art as in life he insists on a man upholding what is best, let the consequences be what they may, and a devotion to principle is shown in his success as a teacher, in his figure pieces, and in his portraits.

## DRY ROT.

BY GEORGE MURRAY.

AMONG agents in the destruction of timber and wood-work generally, at least in our climate, fungi deserve the chief place for completeness and rapidity of destruction. Their ravages cannot be undone, and complete renovation of the regions attacked has generally to be made in order to render the repair effectual. The mode of life of such organisms can hardly fail to be of interest even to those who regard them only from the economic and practical point of view. That they are plants is a matter of common knowledge, and from this it follows that they share with other plants the fundamental and essential conditions of life. In their behaviour towards the forces which operate on them from the outside, such as heat, light, cold, moisture, and the like, they agree with other plants. There are, that is to say, for each phase in their development—their germination, their growth, the processes of vegetation and of reproduction—a certain degree of temperature, called the *minimum*, below which such process may not go on; a *maximum*, above which the same does not take place; and, between these extremes, an *optimum* temperature for each particular phase at which it proceeds with the greatest activity. The same is true of the other conditions of life (moisture, light, and the rest), and though the degrees of these vary with different species of fungi, yet they all hold together pretty closely.

The remarkable fact should be noted here that fungi, like other plants, will survive a much higher temperature if they be dry than in a damp condition. In the modes and conditions of life they resemble other plants, except in the important respect of their way of getting a living. Green plants, as we all know, are the ultimate food-producers of the whole animal kingdom. Directly or indirectly we come to them at last, and the profound truth that "all flesh is grass" has been recognised from the earliest times to the days of comparative physiology. These green plants are the only organisms which are able to convert inorganic matter into organic matter—into food, in short, though an acute observer has recently discovered an enterprising and minute green animal which in the most praiseworthy way does this for itself as the plants do. This ability resides in the green-colouring matter, and the food is prepared primarily for the plant's own use; for example, the starch stored up in a potato-tuber is but the "reserve material" for a fresh outgrowth of the plant. However, this is but a feeding of themselves to fat others, and along with the animals certain other plants, such as fungi (which never possess the proper green-colouring matter, and are therefore unable to assimilate food for themselves), share in the feast thus prepared for them. Fungi, then, are unprovided with the means of converting inorganic matter into food, and are therefore driven to obtain from other plants the carbon compounds elaborated honestly, as it were, by the latter. There is little honour, however, among these thieves, since fungi often attack animals, and even other kinds of fungi, to rob them of their "unearned increment." We see thus how it comes that fungi are not found maintaining themselves like other plants, but growing on and destroying vegetable products, such as timber and the like.

The case may be further illustrated thus. Everyone knows that many diseases of living things are caused by fungi. One cannot take a walk in the country without seeing fungi growing on living forest trees—large ones on the trunks and branches, and minute (microscopic) ones discolouring the foliage. There is the fungus of the potato-disease, that of corn mildew, and very many others all familiar to us. Well, we can discriminate between such fungi as grow upon living things, producing diseases in them; and such as grow upon and promote the decay of dead matter, once living and forming part of a plant or of an animal. Thus a line can be drawn between the fungi called *parasites*, attacking living forest trees, and those such as "dry rot," which confine their depredations to the dead timber. The latter kind are called putrefactive fungi. For example, the fungus which attacks the living gooseberries on the bush is a parasite, and the other which grows upon gooseberry-jam is putrefactive. And here it may be remarked, in a parenthesis, if housewives were only careful to

firmly fasten down in an *air-tight* manner the paper covers of their jam-pots *at once while the jam is still very hot*—it cannot be done too soon—they would find it perfectly safe from fungus mould, if stored in an ordinary dry cupboard. This is not merely untested theory, for the truth of it can be demonstrated by anyone who strictly observes these simple conditions.

However, though in ordinary speech one can generally describe a fungus as either parasitic or putrefactive, and though these are the only modes of life open to an organism of this kind, yet brief mention must be made of certain others which taste the sweets of both ways of subsisting. That is, there are some kinds of fungi which, during one phase of their existence, are content with the dead remains of a plant or of an animal, while in the next they rise to attacking a living organism. There is nothing striking in the appearance presented by a fungus which enables one to say of it that it is parasitic or putrefactive; the whole affair is one of function rather than of structure, and, while one kind may be purely a parasite, its nearest ally in *structure* may be putrefactive. It is true, nevertheless, that "function makes the organ," which is to say simply that an organ discharging a special duty becomes modified in time by it, and when this duty is a parasitic one the modification that takes place is towards degradation. So one finds Nemesis pursuing these dishonest livers, if one may venture to describe them so; the parasitic, and next to them the putrefactive, are the degraded among plants. Of the higher flowering plants, the mistletoe for example, which is a partial parasite on many trees (though hardly ever on the oak), is a degraded plant compared with certain others of its allies.

In making clear the character (while blackening it, if I may be permitted the paradox) of these organisms, the intention is to show how it comes that they are regarded by us as enemies. They are in competition with us for the possession of certain matter; they intercept our food supplies, as in the case of the potato disease, &c., or they treat as a food supply for themselves what we would otherwise use—such as timber. On the other hand, there are fungi such as the yeast fungus, of the utmost economic benefit to mankind, which may be merely mentioned to show how rash it would be to doubt the utility of the existence of these organisms, so far as we are concerned. The duties they perform in the wide economy of nature are beyond the scope of an article on domestic fungi.

By taking the dry rot fungus as a type of its fellows, and examining it, one may get at a knowledge of the whole group—the essentials of the structure and life-histories, since it is not remarkably different from others in these respects. The first and most superficial result of examining a mature specimen of it is some astonishment that it ever came to be called *dry rot*. It certainly attacks wood, incorrectly supposed to be dry, and in some states undoubtedly the fungus has a parched look, but most likely the dry and brittle state of the wood, after the attack, accounts for the name. However, the well-developed dry rot fungus is so much the reverse of dry that it distils, as it were, pretty copiously, drops of moisture, and from this habit has earned the descriptive name of *lachrymans*—weeping—on its own account, without reference to its being the cause of that state in others. "*Merulius lachrymans*—the dry rot fungus"—is not a very consistent looking name. It is sometimes supposed to be congenial to the scientific spirit to proclaim what is commonly deemed black to be in reality white, but the present apparent contradiction between dry and wet is easily enough explained. The wood attacked is unduly damp when the fungus fastens upon it, and, along with other things, the moisture is extracted from it, and partly given forth by the fungus which leaves the wood in the dry and crumbling state in which it commonly meets our eye. The last aspect of it is the one which appeals to popular observation, and has earned for it this popular name; while the fungus, the agent in the destruction and the extractor of the original dampness, bears likewise its appropriate name.

The mature fungus is commonly spread out like a cake, often several feet in expanse, and is of a fleshy consistency. In colour it varies from ochre yellow to a rusty hue; but on the under side it turns somewhat violet, and is more downy, while the margin is white and frequently swollen and folded,

as it were. The watery fluid is given off at the period of ripeness, and is at first clear, but gradually gets milky. The odour of the fungus is bad enough, but that given off by the fluid is truly abominable. This is the ripe fungus—the outcome, as it were, of those parts of it that are accomplishing destruction in the interior of the wood. These, the special agents of destruction, are fine filaments which traverse and break down the fibre of the wood, and render it thus so brittle. The name which these filaments bear is the *mycelium*, and it serves precisely the same end as the "spawn" of mushrooms, and is, besides, of very similar structure. If we have a quantity of soil traversed by mushroom "spawn," or mushroom *mycelium*, and if we place it where it will be damp and warm, a crop of mushrooms may be expected in the natural course of things. It is just the same with the spawn or the *mycelium* of the dry-rot fungus.

It has its own optimum degree of temperature and optimum amount of moisture, &c., and when these are present, as they frequently are in damp dwellings, the spawn will proceed with its growth and development at the fastest rate. It will extend its field of operations, and will fructify in the unpleasant manner described above. Let the temperature fall below or rise above this optimum, and the growth will slacken and finally cease when the minimum or maximum is reached. The same is true of the amount of moisture present, and so on.

Now this large and unpleasant cake-shaped body so easily-recognised is in reality the fruit of the fungus, and, like the fruits of higher plants, it is nourished and brought to perfection by means of these roots—the *mycelium* or spawn filaments which penetrate the wood. Like fruits, moreover, it bears seeds, and the seeds—or *spores*, as they are properly called in the case of fungi—are produced on this cake in vast numbers, literally in millions. They are exceedingly minute, and a powerful microscope is needed for seeing them at all. When observed with the microscope, they look like small eggs, and each one of these millions of spores is endued with the power of reproducing dry rot; of setting up anew the destruction of wood; of producing a similar cake-like mass and another generation of these seeds of destruction. How, with such a fact before us we may well ask, does such a thing as timber continue to exist at all? Well, as we have already seen, it is only in the presence of certain degrees of temperature and their accompaniment of certain degrees of moisture, and so on, and, moreover, on certain states of timber that these bodies are able to grow afresh. Not only so, but the incomparably vast majority come to naught, since millions upon millions fall on stoney ground and by the wayside, and thus perish. In fact, it is only the very, very few that have any chance at all, and the production of these untold numbers of potential dry-rot fungi is merely a provision against the thousands of adverse chances.

We may, however, be sure of one fact, namely, that wherever circumstances combine to render wood a fit host for them, there such spores will settle. They are present in vast numbers in the air ready to take advantage of such a set of circumstances. Improperly-selected wood—unseasoned it may be—and often wood originally sound, but placed in a damp or otherwise improper situation, offer suitable ground for the operations of dry rot. Such a condition of wood, in fact, in respect of moisture, temperature, and so on, as falls within the maxim. and minim. degrees of germination of the fungus constitutes a predisposition towards dry rot, as a physician would say. The nearer such degrees approach the optim. in respect of these conditions, the more favourable is the field for the fresh growth of the fungus.

(To be continued.)

#### FRENCH AND ENGLISH SURVEYING.\*

IT was generally acknowledged that the most successful part of the educational section of the Health Exhibition at South Kensington was the room assigned to the Frères des Ecoles Chrétiennes. The space was insufficient to show more than a fraction of the examples which had

\* "Arpentage, Levé des Plans et Nivellement." Par F. J. C. Paris: Poussielgue Frères. Tours: Alfred Mame & Fils.

been sent from the Continental schools belonging to the Brothers, and the works which were unpacked were, we understood, even more remarkable than those which were to be seen on the walls and tables. But enough was visible to suggest to the initiated how great a revolution has been accomplished by the Christian Brothers in their schools. The teachers have not been well treated, in France more especially. French wit when they are the subject loses its point, and things have been written which are enough to make VOLTAIRE arise from his grave, and in rage turn Capuchin. Since France became a Republic the Brothers have known to their cost what is meant by the insolence of office, and when other means failed, the ingenious principle of "laicization" was devised in order to starve them into a surrender. And yet those derided and oppressed men are enabling the youth of France to compete in technical information with the rest of the world. England is suffering through the knowledge which has been instilled in the schools of the Brothers on the Continent; but we must be just to our opponents, and recognise the devotion by which children of the humblest classes have been transformed into men who are able to bring science and art into their workshops. In this country it is difficult to believe that teachers in schools can be anything but theorists, and IAGO expressed the national prejudice when he spoke of "the bookish theoretic," the "mere prattle without practice." Whether it is wise to make schools become, as it were, porches for factories is too wide a question to be discussed here, but it must be admitted that the industrial struggle between nations has assumed greater intensity of late years, and that the very existence of a country is dependent on the technical skill of the inhabitants, of which the beginning must be found in elementary schools. Simple people could at one time believe that—

When house and lands are gone and spent  
Then learning is most excellent.

But those Arcadian days have passed away, and all the books in the Bodleian, with an army of professors, could not console Birmingham if it saw the metal trade transferred to France or Germany.

Unless we are mistaken, the success of schools is mainly owing to the existence among the Brothers of experts in sciences and arts and in nearly all trades, who have been attracted from the world. We refer as a proof of mastery to the books on mathematics which were to be seen at South Kensington, and were very different from those we might expect from a Cambridge man, for in them there was a clearer recognition of the applications of the science than is usual in English teachers. One of the series is now before us, and it is sufficiently ample to be taken as an authority on land and engineering surveying of every kind, levelling, setting out, and contouring, as conducted in France. It will enable anyone to compare a few points of practice with those adopted in this country; but if a French writer has any wish to follow our example, it may be stated that there is no English school-book available for his purpose. Although so large a proportion of schoolboys in this country are destined to become colonists, it is not considered requisite that they should know anything of the elements of surveying, which would often enable them to be useful to themselves and others.

It is hardly necessary for us to say that all over the world surveying means triangulation. If a field, a country, or an ocean can be covered by imaginary triangles, and if the operation is properly carried out, we have the areas. The work is so simple and certain we may assume that the procedure of the Egyptian surveyors could not have differed much from the system that is still in use in many parts of this country. By the aid of optical instruments time and trouble can be saved, but the bases of all maps and plans is the formation of triangles within and without the boundaries of the land which has to be surveyed. This principle is so much of a truism we ought to offer an apology for stating it in a technical journal, but we have met with books which could have been simplified if it had been recognised by the authors at starting.

The English chain which is employed in ordinary surveying contains 100 links, and measures 22 yards, because the statute acre contains 4,840 square yards. But on

surveys for railways and large engineering works, chains with links of 1 foot and measuring 50 or 100 feet are found to be more convenient. The French have no measure that corresponds exactly with our acre. The *are* is equal to 0.0247 acre, the *decare* is equal to ten, and the *hectare* to a hundred *ares*. In round numbers the hectare is about two and a half English acres. The French surveyor's chain has fifty links, with a total length of ten mètres, or about eleven English yards—that is one-half the length of ours. In England the links are made as straight as possible, but in France they are curved, and therefore are likely to be in need of more frequent verification. A ribbon of steel, with copper studs for the divisions, is sometimes used in France, and from its horizontality is in favour, but it is costly and easily broken. The French "fiches" are like the English "arrows," but some are made heavy towards the point, in order that they may fall in a vertical direction when dropped in measuring declivities. For the laying out of right angles the French are more disposed to employ varieties of the plane-table than the English. The geometry of the triangulation is necessarily the same everywhere. There is a good deal of difference between the levels and theodolites of the two countries. The English instruments appear to be more compact in all the parts, and are carried on a more portable tripod.

The methods of plotting, enlarging and reducing plans are practically alike on both sides of the Channel. Thus the "méthode de la piqure" corresponds with the English way of pricking the principal points and uniting the holes by lines; "craticulation" is the old method of squares, and "calque" is copying by means of a plate of glass. The proportional compass is also used. The old-fashioned surveyors were partial to ornate titles, and when the writing was in good style, a title added attractiveness to a plan; but when, as very often happened, there was more ambition than beauty about the lettering, the effect was ridiculous. The Christian Brother who has written the manual on surveying has shown the same good sense in selecting the patterns of his letters that we find in the more scientific parts of his book. They consist mainly of Roman and Egyptian letters, but if well formed they can be effective, and will give a practical character to a plan.

The examples are derived from genuine plans. The working section is of a railway from Rodez to Montpellier, and is evidently after one that was originally plotted in England. It will be found to correspond generally with those which are in use in Westminster offices. There are some differences. Thus, for example, the accumulated horizontal distances are shown, and the advantage is not apparent of writing so many figures when they refer to points which are close. Errors are likely to creep in when large numbers like 24,236.60 have to be placed at distances of about the eighth of an inch. In England the chain points are noted, and the intervening distances are readily scaled. The French levels run to three places of decimals, while in England two are considered ample. Ordinates are drawn in ink at every variation of level, but in a working section it is better to draw them only at the points which mark each chain length, and which on the ground are fixed by a stake. It is also a convenience to have the quantity of cutting or embankment for each chain. Various modifications of the prismoidal formula are given for the calculation of earthwork. In practice tables can be employed, but it is wise to make students understand principles, and it often happens that a quantity has to be ascertained in places where a man has to depend on his mathematical knowledge. The remarkable thing about this and the other books of the Christian Brothers' series, is that although the majority of the students are taken from the humble classes, there is nothing empirical or suggestive of rule of thumb in the pages. The information is of the highest class, and it is not easy to foretell what will be the future of a people who can be educated according to the standard which this book indicates. In England the influence of cliques is probably most felt in respect of school books, for certain publishers, authors, and professors can dictate that such and such books are to be used, and no others, or failure will follow. Otherwise it would be an advantage to many an earnest student if translations of the series were given, but adapted to English requirements. The illustrations in the book are of a superior kind.

**TESSERÆ.****Professional Education.**

JOHN RUSKIN.

IT might be matter of dispute which processes have the greatest effect in developing the intellect, but it can hardly be disputed what facts it is most advisable that a man entering into life should accurately know. I believe, in brief, that he ought to know three things:—First. Where is he? Secondly. Where is he going? Thirdly. What has he best to do under these circumstances? First. Where he is. That is to say, what sort of a world he has got into, how large it is, what kind of creatures live in it, and how? what it is made of, and what may be made of it. Secondly. Where he is going. That is to say, what chances or reports there are of any other world besides this; what seems to be the nature of that other world, and whether, for information respecting it, he had better consult the Bible, Koran, or Council of Trent? Thirdly. What he had best to do under those circumstances. That is to say, what kind of faculties he possesses; what are the present state and wants of mankind; what is his place in society; and what are the readiest means in his power of attaining happiness and diffusing it? The man who knows these things, and who has his will so subdued in learning them that he is ready to do what he knows he ought, I should call educated; and the man who knows them not—uneducated, though he could talk all the tongues of Babel.

**Disproportion in Architecture.**

PROFESSOR COCKERELL, R.A.

If we stand under an arch of London Bridge, the vaulted soffit, so vast and extended, sustained from such distant abutments, produces a kind of sublime; no doubt aided by its comparative lowness. The Pantheon is inscribed in a cube, its height equal to its diameter; no one standing under its prodigious cupola has ever denied its sublimity. But when that same Pantheon is raised into the air (in equal dimension) at St. Peter's, it may have become beautiful, but has lost its quality of sublime. As the dome of the Pantheon is raised at St. Peter's into a proportionate height, at the expense of its sublime, so the nave (nearly twice as wide as that of St. Paul's Cathedral), also raised proportionately, loses all effect of magnitude; and the common and universal observation is that, as respects this important effect, the architect has laboured in vain; and the work stands self-condemned. Had the nave of St. Peter's, 77 feet wide, been 90 feet high only, instead of 145; or if we were to suppose a stage raised mid-height, and place ourselves upon it, we should be sensible of its vast latitude, and the effect of magnitude would have been produced as under a bridge. If, then, the architect can obtain latitude, he should seek to carry out its effect by quadrate and comparatively low proportions; but if he adds altitude to his latitude, he loses his expense and pains, and he may find too late that half his dimension might have attained the same effect: since proportionate magnitude defeats itself. But as extreme latitude gives the sublime, so does its opposite extreme of altitude. In Cologne and Beauvais, the naves of which are three and a half diameters in height, though scarcely more than half the actual width of St. Peter's nave—limited, therefore, in their dimension to the usual cathedral width, yet nearly double the usual proportion—the sublime is completely attained; and disproportion again appears to be the efficient cause. But the optical consideration of the visual angle in which these proportions present themselves is exceedingly important. Thus to the spectator of the dome of the Pantheon, the visual angle is 95 degrees, while the same dome raised into the air at St. Peter's is only 30 degrees. In the nave of St. Peter's the visual angle is 48 degrees, that of St. Paul's Cathedral is 37 degrees, while the vault of Cologne is only 22 degrees. Since, then, the effect of magnitude is measured by the number of degrees in the visual angle, the architect will advert to this consideration as of extreme interest. We come, then, to the important conclusion that the sublime and the beautiful are to be found in the proper adjustment of proportions rather than in dimensions; and we may infer that no increase of scale to the beautiful will ever make it the sublime.

**Flatness in Wall Decoration.**

OWEN JONES.

It is very evident that the treatment of a picture in fresco should be very different to that of a painting in oil. In the painting in oil all the resources of art are invoked to make as far as possible the picture appear a reality. Within his frame the painter has to himself a world, but it should be far different with a fresco; the flatness of the wall should never be disturbed, all chiaro-oscuro should be avoided, and the figures should be on one plane. In fact, a true fresco should be little more than a painted bas-relief. Such were the early frescoes, or more early still, the mosaic paintings.

**The Five Orders.**

SIR M. DIGBY WYATT.

What may be injurious as an inflexible rule of practice may constitute an excellent system of training for the student, and in spite of all the complaints which have been made as to the time wasted by architectural students in what is called "drawing out the Five Orders," I believe that the precise system of learning how to proportion one part of a structure to another which may be gained by such practice is a most valuable exercise, and one tending to assist the ultimate practice of the architect in a very great degree. Rightly followed out, this course of study compels the architect to learn how to make drawings to scale, with plans of every portion and detail of complicated architectural forms, with minuteness and geometrical accuracy, so as to be able to convey to others the knowledge of the way in which from regular cubes any portion of what he may draw may be evolved. He thus familiarises himself with the tangible basis of the geometry of solids, upon which all masonry must depend.

**Classic and Gothic Vaulting.**

PROFESSOR WILLIS.

In vaults of the Roman and Italian styles, of which the groins are without ribs, the vaulting surface is the leading feature, and the disposition of it the only object to be attended to. But in Gothic ribbed vaults, on the contrary, the ribs are the principal features, and the surface of the vaults subordinate. To maintain this subordination of the vaulting surface to the ribs, the latter should branch off from the abacus with the greatest possible appearance of mutual independence as separate arches, an appearance which is better given by single-arc ribs than by double-arc ribs, or semi-fourcentred arches. Also, the vaulting surfaces or panels of contiguous compartments should by no means have the appearance of continuity, which is given by the projection system, but which immediately suggests the idea that the surfaces really constitute the mechanical vault independently of the ribs, which seem to have been subsequently added, and might be removed without destroying the vault, instead of which the ribs really support the vault and should appear to do so in the decorative as well as in the mechanical construction. The apparent mutual independence of the ribs is increased in the best specimens by the manner in which they start from the abacus, some being more prominent than the others.

**Approximate Computation of Areas.**

SIR J. F. W. HERSCHEL.

A very great saving in the expenses of computation in the reduction of local surveys, to give the areas of districts, parishes, estates, and fields, as laid down in maps, has been found to result from the use of planimeters, where indications are sufficient for all practical uses. Tracing with a pen dipped in dilute sulphuric acid on paper of a moderate and uniform thickness, by the aid of transmitted light, and weighing the portion cut out by the corrosive action of the acid on exposure to heat, will enable any one to extemporise a planimeter, following the most intricate details of outline, and giving the total area with a very considerable approximation.

**The Chemistry of Mortar.**

PROFESSOR SULLIVAN.

Cement in its widest sense means any liquid or plastic substance capable of solidifying, by which bodies may be firmly bound together, but it is, perhaps, better to restrict the term to those of mineral origin, in which the lime is employed in the condition of carbonate of lime, or caustic lime. If we burn a piece of limestone or chalk, we deprive it of its carbonic acid, and reduce it to the condition of caustic lime, which, on being moistened with water, will combine and solidify a portion of it, and become slaked or hydrated lime. If this compound be exposed to the atmosphere, it will gradually absorb the carbonic acid, which is always present in minute quantities in the atmosphere, and becomes the same substance, chemically speaking, that it was previous to having undergone the operation of burning. Its form will, however, be completely altered. Instead of being a hard compact mass, it will be quite pulverulent. If, however, it be mixed with a large quantity of sand, and placed as mortar between stones, it will in course of time become quite hard, and bind them together. The cause of this cementation is not well understood; but, so far as we can judge, it is attributable to—(1) The action of the lime upon the sand, by which part of it is converted into silicate of lime, which is insoluble. (2) The crystallisation of part of the caustic lime; and (3) the peculiar force which causes certain substances to abstract from a solution a portion of the solid matter which it may hold dissolved without combining with it, and which even acts to some extent between one solid and another made into a paste with water. This is the same force

which causes dye stuffs, &c., to adhere to tissues. That these forces may produce their full effect, the mortar must gradually dry, and hence, in the presence of water, scarcely any binding action could take place. There are some limestones, however, which, when properly burned, will actually become hard even under water. On this account, they are called hydraulic limes, from their capability of being employed in hydraulic structures. It is quite evident that the cause of the settling of such limes is to a great extent different from that of common mortar. In this case the cause is apparently altogether chemical, for we find on analysing these limestones that they do not consist of pure carbonate of lime, but contain a variable proportion of a material consisting chiefly of silicates of alumina with some potash and soda. When such limestones are burnt, the carbonate of lime which they contain is converted into caustic lime; this reacts upon the silica compounds, and forms a combination that solidifies in water. The more, therefore, of this clay-like substance which exists in a limestone up to a certain point, the more rapidly and perfectly will the resulting lime solidify under water.

#### Peterborough Cathedral.

G. E. STREET, R.A.

There is one façade in England which may be said to be peerless—that of Peterborough. Here, three vast arches, rising the entire height of the fabric, cross the whole west front; the doorways behind them are of the usual modest dimensions, but the charm of this great porch is indescribable. You see the deep shadows of the arches rising high above the surrounding houses as you approach the city from the distance; they are adorned with line upon line of moulding, carried by whole ranges of delicate shafts, and surmounted by gables filled with niches and sculpture, and circular windows of rare beauty, flanked and divided by lofty pinnacles. This may, in truth, be said to be the most poetic conception of the thirteenth century in England; it deserves a pilgrimage from the furthest part of the empire from all those who wish really to grasp the combined power and tenderness of the thirteenth-century art, and lives in the recollections of all who have seen it with eyes capable of appreciating it as among the most lovely of man's creations.

#### Porosity of Stone.

C. H. SMITH.

If the natural texture or disposition of the particles of two or three stones could be conveniently examined upon an extremely magnified scale, no person would imagine that to be the most durable which had scarcely any cement to unite the grains together. It requires no great stretch of philosophical investigation to understand that, whatever the cement may be, that stone which contains the largest quantity of cement in the interstices between the grains will certainly be the least affected by external influences. In a stone that is very open and porous, each component grain on the outside has very nearly all its surfaces exposed to the action of mechanical violence, such as the freezing of water after being forced into or absorbed by the external portions of the stone. The solvent power of water, even in its simplest state, is a fact so notorious that the mere allusion to it seems almost needless. And the atmosphere, especially in England, is always charged with a sufficient quantity of aqueous vapours to engender inevitable decomposition in a stone of a slightly cemented and powdery nature. The chemical action of a humid atmosphere, in conjunction with powerful winds and driving rains, produces a decomposition of the entire surface of limestones, commencing with the particles which have the weakest attachment; whereas the same action, if all other things be equal, will only affect the cementing substance of sandstone, the grains of quartz in it being comparatively indestructible. But in either of these cases, whether chemical or mechanical, the stone that is closest in texture and most crystalline will also be least porous, consequently it will present the largest portion of matter in a given space to resist decomposition. But, like the fable of the "bundle of sticks," the more the grains are separated from each other the more readily will the whole be destroyed. A stone may be very porous, consequently very absorbent, and yet sufficiently durable for architectural purposes. Its durability depends upon the cement being strong enough to resist the mechanical forces to which I have alluded. By this statement I do not mean to infer that absorption is a desired quality; a stone may be comparatively like a sponge and yet last for ages without any mineral decomposition; but if two kinds of stone were equal in every other respect, that which will soak up least water will certainly be the most durable. Few mineral substances will hold more water than a good graystock brick, which will probably last as long as any stone, because its component parts are held together by a strong vitreous cement; but a clinker brick is less absorbent, because it contains a greater quantity of the same kind of cement, and is therefore less likely to yield to the atmospheric influences.

#### THE PETERBOROUGH CATHEDRAL SQUABBLE.

A LETTER from Sir Edmund Beckett, as the nominee of the Dean of Peterborough, has been printed in the *Times*. It relates to the dispute about the grounds on which subscriptions have been obtained for the restoration of the Cathedral. On November 13 "the Chapter consented to call a meeting to consider Mr. Pearson's several designs." It soon became apparent, says Sir Edmund Beckett, that Canon Argles and his party were in a small minority, and so he objected that the meeting was too small, and he and his party would not vote, but eight did vote against him. Then came our meeting where there was to be no voting, but the two objecting canons had really nothing to say except that they did object. Then there was another committee meeting called, which was much too large for him to call small, and the majority was exactly three to one, as I explained. Thereupon, he comes out with what he is pleased to call an "eirenicon," which is the established clerical phrase for a device to get your own way while appearing to give way.

That splendid effort deserves a paragraph of its own, and I should think will satisfy everybody of his competence to be the arbiter over everybody as to the proper mode of restoring a cathedral. On December 22 the Chapter "resolved, in reply to the resolution of the committee of the 17th, that they beg to say that the tower may be raised with their assent by the insertion in the contract of the single stage of the Norman arcading, as recommended by the committee" (as the only pressing question yet), "provided the funds are forthcoming, and that the pointed arches east and west as before be proceeded with."

Just conceive three men who happen to have the legal power over a cathedral overriding 20,000*l.* worth of subscribers with such a resolution as that, in order to stick in two good-for-nothing pointed arches, with everything else Norman above and below and all around them—for it is the most completely Norman interior in all England—and they have not one word to say for it except they that they were there before. And why? The answer to that is another curious fact in the case. The very able clerk of the works there, who had restored several cathedrals under Scott, has discovered proofs, which nobody disputes, that those two intruding arches were nothing but an *ex post facto* makeshift of the fourteenth-century builders, who had first tried to erect a light and low lantern storey on the top of all four Norman arches, and then found that the east and west ones were so much worse than the others that they would not bear any lantern, and so they had to pull it all down again and put in those arches, which are, of course, stronger and lighter than round ones; besides that the old builders always built in their own style. Canon Argles and his two satellites are determined to deface the Cathedral for ever with those monstrosities now to be interpolated in the midst of Norman work, which they never were before. His polemic of prohibiting any Norman restoration except where actual Norman remained was ridiculous enough, but his eirenicon is still more absurd.

I will not write a word of architectural argument at present, though I need not say that I have plenty to say on that point. The present is the moral question—whether a committee which the Chapter constituted to give confidence to the subscribers is to be overridden by such lunacy as this. The faculty committee at St. Albans had absolute power, and everybody who subscribed knew it; and yet when the minority thereof desired to appeal to the subscribers we allowed them, and had the satisfaction of beating them there still more, and then the minority in the committee sank to two, who thereupon discreetly abdicated. There the question was the same, viz., whether to rebuild the late and bad Gothic work or the early and good. Mr. Ferguson truly says in this month's *Nineteenth Century* that probably no one now wishes it to have been done otherwise. So it will be at Peterborough. When these obstructives have been beaten, as they must be, Peterborough Cathedral, with very nearly the longest nave in England, and one of the four or five widest towers, will again have it of the proper height, with the *tres historiae* recorded of the old one, though the style of the top storey, the rebuilt Decorated one, will be later than of the lower storeys, as it is at York and Lincoln, and Durham and Salisbury, and more or less in some others.

The Chapter wants ever so much more for general repairs. How much do these three canons expect anybody to trust them with hereafter if they defy everybody who finds it and their own architect, without having a word of reason to give for it?

**Notes and Comments.**—Owing to the number and length of the original articles, we have been compelled to omit "Notes and Comments" for this week.

**Mr. Roger Rowe**, of Farnworth, has lately laid down his improved wood block flooring in many public and private buildings.

THE BARD.  
*Phemius' Chanting in the House of Ulysses.*  
*From the painting by Jean-F. H. Maitland.*

D. MAILLART

## ILLUSTRATIONS.

PHEMIUS CHANTING IN THE HOUSE OF ULYSSES.

IN the "Odyssey" there are two or three references to the minstrel PHEMIUS, who has been introduced so prominently in M. MAILLART'S picture, and gives it a title. That poem, it will be remembered, opens with a council of the gods. PALLAS ATHENE, or MINERVA, implored ZEUS to take compassion on ULYSSES, who at the time was in thrall to CALYPSO on the island of Ogygia :—

Ulysses, happy might he but behold  
The smoke ascending from his native land  
Death covets.

The easy-going ZEUS was persuaded to relent. MINERVA then resolved to visit Ithaca, in order to inspire TELEMACHUS with a desire to seek his father. On entering the house of ULYSSES, the goddess found TELEMACHUS in a desponding mood, seated amidst the crowd of suitors for the hand of his mother, who was supposed to be a widow. The book of the good Bishop of CAMBRAI has, in English schools at least, made boys believe that the prince was one of those model youths who have little of the heroic about them, and, in consequence, there is a prejudice against him in men's minds. Like CALYPSO, we are astonished at so much wisdom and eloquence in youth. But the Homeric TELEMACHUS is a true Greek in courage, subtlety, and desire to have revenge on his enemies. He knew that the suitors who were every day wasting his father's substance would, if they had the chance, deprive him of his possessions and his life. It was natural for the son of ULYSSES that he should wish to remove them. He felt, however, that one so young was helpless; but as he sat his thoughts sometimes turned towards the storm-tossed wanderer against whom the gods conspired—

Bright picturing in his mind, how, home again,  
His sire would put to flight the wassail train,  
Resume his honours, and ancestral right.

While TELEMACHUS was thus musing, the goddess appeared in the guise of MENTES, a leader of the Taphians, and stood outside the door. The prince at once invited the stranger to enter, and, out of respect, was placed in a position that was a little remote from the suitors. A feast followed of the Homeric kind, in which one reads of golden bowls and wheaten bread, coarse viands and honey-sweet wine. When the meal was ended, the suitors who did as they liked in the house demanded music. Accordingly a lyre was put into the hands of PHEMIUS, who was the bard of the family, the poet laureate of Ithaca. He must have known that his auditors were the enemies of his lord, and accordingly it has been supposed that he complied under compulsion. But old CHAPMAN, whose insight is worth another man's scholarship, in translating the passage, says :—

The herald straight  
A harp, carved full of artificial sleight,  
Thrust into Phœmius', a learned singer's, hand,  
Who, till he was much urged, on terms did stand;  
But, after, played and sung with all his art.

The hesitation of the minstrel was probably not unlike the fears which are expressed by young ladies who are asked to sing at Christmas parties, and which in reality are expressions of a wish to be pressed. That PHEMIUS was culpable in performing for the gratification of the suitors, is seen by his terror when the time came for ULYSSES to avenge himself. He selected one of those mournful subjects which are doubly affecting to men who, having drank freely, can enjoy the luxury of woe. PHEMIUS related the story of the sufferings of the Achæians on their retreat from Troy. It was on those occasions that the Greek felt the nearest approach to home life, and it is no wonder that the houseless ULYSSES should be moved to tears when an opportunity was given to him to see numbers of people united under one roof, at a time when hospitality was exalted by poetry and music :—

The world in my account no sight affords  
More gratifying than a people blest  
With cheerfulness and peace, a palace thronged  
With guests in order seated, and regaled  
With harp and song, while plenteous viands steam  
On every table, and the cups, with wine  
From brimming beakers fill'd, pass brisk around.  
No lovelier sight I know.

The song of PHEMIUS, which gave pleasure to the suitors, was heard by PENELOPE in her upper chamber, and had a different effect on her mind. The princess, accompanied by two handmaids, descended to the hall, and standing by the door implored the minstrel to stop or change his strain. It suggests the courteous attention to guests which then prevailed when we find that PENELOPE'S anxiety was not entirely on her own account, and there must have been strong reasons for acting in a way that was so contrary to custom. TELEMACHUS remonstrated with his mother, on the ground that poetry was a revelation of the gods and should accordingly be respected :—

Leave to the bard free mastery of his mind;  
'Tis not the minstrel, 'tis the will of Jove  
That breathes the inspiration from above.  
Then blame not Phœmius, whose recording lay  
Mourns their sad fate who steer'd from Troy their way.

Then asserting his authority as head of the household, TELEMACHUS directed PENELOPE to return to her upper chamber. Such is an outline of what is told about the chanting of PHEMIUS in the "Odyssey." After ULYSSES has slain the suitors the minstrel clasps his knees and implores mercy, and is saved on the intercession of TELEMACHUS.

A figure of PENELOPE, taken from a picture by M. LECOMTE DU NOUY, which was published in *The Architect* in 1882, represents the princess, enveloped in her shining veil, holding a portrait of ULYSSES and a little bow that is suggestive of the death-dealing weapon. The figure is mysterious. She, too, had a Greek's craft, and her diplomacy in beguiling the suitors for four years with promises and presents was almost worthy of her husband. There was also the ruse of weaving a winding sheet, which should be in readiness for her father-in-law, the old LAERTES, a piece of work which, as it was unravelled by night, could never be accomplished. It was with more or less reason that the suitors declared that they were not entirely guilty for all the extravagance which their presence entailed.

The PENELOPE of M. MAILLART is conceived in a different spirit from that which we have already published. It will be seen that the artist does not attempt to render HOMER'S description with literal accuracy. M. MAILLART reads HOMER for inspiration, and prefers to paint something which may have occurred rather than to illustrate a particular passage. Instead of standing against the doorpost with her face veiled from observation, PENELOPE is shown seated, and being strong is not quite overcome by the lay of PHEMIUS. She is attended by an old woman and a young girl. HOMER simply says there were two handmaids. By making one of them aged, M. MAILLART suggests the presence of the ancient nurse EURYCLEIA, who recognised ULYSSES when she saw the scar on his leg as she was bathing his feet. In this way the story is helped, as it is also by the introduction of a loom behind PENELOPE. Another ingenious interpretation is the figure of the bard, which recalls the ancient busts of HOMER himself. There is nothing said in the "Odyssey" about the personal appearance of PHEMIUS, and Herr PRELLER, whose fresco was illustrated in *The Architect* some years ago, might claim to be correct when he represented him as a comparatively young man. But beyond the poem there is a legend, according to which PHEMIUS was one of HOMER'S friends, and may have been his master. As we always associate age with HOMER, it is natural to suppose that his fellow rhapsodists were no longer young. There is another circumstance which is in favour of M. MAILLART'S theory. A second bard is described in the "Odyssey." This is DEMODOCUS, who is said to have been loved by the Muses, but is blind. He is supposed to have been an image of HOMER himself. M. MAILLART has evidently thought over the allusions, and has concluded that he would be justified in giving PHEMIUS some of the characteristics with which the HOMER of Greek sculpture has been endowed. The vigorous figure which he has designed is such a bard as the imagination suggests when reading HOMER or even one of the northern sagas, and there is infinitely more pleasure in contemplating him in his fine frenzy than observing the craven who has been depicted by FREDERICK PRELLER. There is no suggestion of suitors in the picture, and TELEMACHUS is apparently moved by thoughts which are in accord with those of his mother.

There is consequently a departure from the poem, or rather there is an addition to it. HOMER does not describe the scene, but it is reasonable to suppose that on one occasion PENELOPE did listen to a part of that wondrous Tale of Troy which was destined to have so much influence on human life; and while her son and his friend were excited to pity and revenge by the sufferings of ULYSSES, the thoughts of the old nurse were carried back to the time when the man whose career had become legendary was a baby at her breast. For once the revelry of the suitors was not heard, and the girl who sits so demurely at the side of her mistress, and those who are behind the chair, can have no suspicion of that day of wrath which was fast approaching, and of the black beam with the row of nooses which was to be fatal to so many young lives in the house. M. MAILLART represents a peaceful interlude in a great tragedy, which is preceded and followed by death.

According to the old academic rule there are three elements in a picture, namely, invention, drawing, and colour. The illustration will suggest M. MAILLART'S power in designing and drawing the figure. The principal figure is that of PENELOPE, which is prominent without being obtrusive. In contrast with the princess are a young girl and a much older woman, and opposite is the old minstrel. The curved lines are contrasted with the vertical lines of columns, spears, loom, &c., and there is also the contrast between the vigorous standing figure of TELEMACHUS and those which are seated. The principal group may be comprised within lines which form a pyramid, and yet they are without any suggestion of stiffness. There are many other points which are suggestive of established principles of art, but it is unnecessary to point them out.

#### ASKHAM HALL, NEAR YORK.

THIS mansion, the country seat of Sir ANDREW FAIRBAIRN, M.P., is being built on a site at present occupied by an old hall, the rooms of which are inconveniently low, and the kitchen and other offices insufficient. The park in which the building stands is a finely-timbered one, with historic interest, as forming a part of the battlefield of Marston Moor. Standing isolated as it does, the hall had to have its independent system of drainage and water supply; the former being treated by precipitation, the effluent being discharged into the fish pond. The latter is obtained from a well, the water being pumped by a hot air-engine into a tank at the top of the tower, and from thence distributed by gravitation to where required. In order to obtain work of first-class character much of the material has to be brought from a distance, the stone for example coming from Bradford, and the facing bricks from Leeds. The architects are MESSRS. CHORLEY & CONNOR, of Leeds, and all the contractors hail from the same place; the bricklaying, mason, and plasterers' work being by MESSRS. FRANKS & EVANS; the joiners' work by Mr. J. HULL THORP; the plumbing by Mr. J. LINDLEY; the tiling by MESSRS. WATSON, WORSNOP & CO.; and the ironwork by MESSRS. NELSON & SONS.

#### THOMAS GAINSBOROUGH.

IN the opening number for last year we published a character of Sir Joshua Reynolds by his friend, William Jackson, of Exeter. As an exhibition of Gainsborough's works has been opened at the Grosvenor Gallery, we now give the companion sketch by Jackson, which is the basis of all the modern biographies of the painter:—

In the early part of my life I became acquainted with Thomas Gainsborough, the painter; and as his character was, perhaps, better known to me than to any other person, I will endeavour to divest myself of every partiality, and speak of him as he really was. I am the rather induced to this, by seeing accounts of him and his works given by people who were unacquainted with either, and consequently have been mistaken in both. Gainsborough's profession was painting, and music was his amusement—yet there were times when music seemed to be his employment and painting his diversion. He frittered away his musical talents; and though possessed of ear, taste, and genius, he never had application enough to learn his notes. He scorned to take the first step, the second was of course out of his reach, and the summit became unattainable.

As a painter his abilities may be considered in three

different departments—portrait, landscape, and groups of figures, to which must be added his drawings. To take these in the above-mentioned order.

The first consideration in a portrait, especially to the purchaser, is that it be a perfect likeness of the sitter—in this respect his skill was unrivalled. The next point is, that it is a good picture—here he has as often failed as succeeded. He failed by affecting a thin, washy colouring, and a hatching style of pencilling; but when, from accident or choice, he painted in the manly substantial style of Vandyke, he was very little, if at all, his inferior. It shows a great defect in judgment to be from choice wrong, when we know what is right. Perhaps his best portrait is that known among the painters by the name of the *Blue Boy*; it was in the possession of Mr. Buttall, near Newport Market.

There are three different eras in his landscapes—his first manner was an imitation of Ruysdael, with more various colouring; the second was an extravagant looseness of pencilling, which, though reprehensible, none but a great master can possess; his third manner was a solid, firm style of touch.

At this last period he possessed his greatest powers, and was (what every painter is at some time or other) fond of varnish. This produced the usual effects—improved the picture for two or three months; then ruined it for ever! With all his excellence in this branch of the art, he was a great mannerist; but the worst of his pictures have a value, from the facility of execution, which excellence I shall again mention.

His groups of figures are, for the most part, very pleasing, though unnatural; for a town-girl, with her clothes in rags, is not a ragged country-girl. Notwithstanding this remark, there are numberless instances of his groups at the door of a cottage, or by a fire in a wood, &c., that are so pleasing as to disarm criticism. He sometimes (like Murillo) gave interest to a single figure—his *Shepherd's Boy*, *Woodman*, *Girl and Pigs* are equal to the best pictures on such subjects; his *Fighting Dogs*, *Girl warning Herself*, and some others, show his great powers in this style of painting. The very distinguished rank the *Girl and Pigs* held at Mr. Calonne's sale, in company with some of the best pictures of the best masters, will fully justify a commendation which might else seem extravagant.

If I were to rest his reputation upon one point, it should be on his drawings. No man ever possessed methods so various in producing effect and all excellent—his washy, hatching style was here in its proper element. The subject which is scarce enough for a picture is sufficient for a drawing; and the hasty, loose handling which, in painting, is poor, is rich in a transparent wash of bistre and Indian ink. Perhaps the quickest effects ever produced were in some of his drawings—and this leads me to take up again his facility of execution.

Many of his pictures have no other merit than this facility; and yet, having it, are undoubtedly valuable. His drawings almost rest on this quality alone for their value; but possessing it in an eminent degree (and as no drawing can have any merit where it is wanting) his works, therefore, in this branch of the art, approach nearer to perfection than his paintings. If the term facility explain not itself, instead of a definition I will illustrate it.

Should a performer of middling execution on the violin contrive to get through his piece, the most that can be said is that he has not failed in his attempt. Should Cramer perform the same music, it would be so much within his powers that it would be executed with ease. Now, the superiority of pleasure which arises from the execution of a Cramer is enjoyed from the facility of a Gainsborough. A poor piece performed by one, or a poor subject taken by the other, give more pleasure by the manner in which they are treated than a good piece of music and a sublime subject in the hands of artists that have not the means by which effects are produced in subjection to them. To a good painter or musician this illustration was needless; and yet by them only, perhaps, it will be felt and understood.

By way of addition to this sketch of Gainsborough, let me mention a few miscellaneous particulars. He had no relish for historical painting; he never sold, but always gave away his drawings, commonly to persons who were perfectly ignorant of their value. He presented twenty drawings to a lady, who pasted them to the wainscot of her dressing-room. Some time after she left the house; the drawings, of course, become the temporary property of every tenant. He hated the harpsichord and the pianoforte. He disliked singing, particularly in parts. He detested reading, but was so like Sterne in his letters that, if it were not for an originality that could be copied from no one, it might be supposed that he had formed his style upon a close imitation of that author. He had as much pleasure in looking at a violin as in hearing it. I have seen him for many minutes surveying, in silence, the perfections of an instrument, from the just proportion of the model and beauty of the workmanship.

His conversation was sprightly, but licentious; his favourite subjects were music and painting, which he treated in a manner peculiarly his own. The common topics for any of a superior

ARCHITECTS

cast, he thoroughly hated and always interrupted by some stroke of wit or humour.

The indiscriminate admirers of my late friend will consider this sketch of his character as far beneath his merit; but it must be remembered that my wish was not to make it perfect, but just. The same principle obliges me to add that as to his common acquaintance he was sprightly and agreeable, so to his intimate friends he was sincere and honest, and that his heart was always alive to every feeling of honour and generosity.

He died with this expression, "We are all going to heaven, and Vandyke is of the party"—strongly expressive of a good heart, a quiet conscience, and a love for his profession which only left him with his life.

### THE LONDON GOLDSMITHS.

THE Goldsmiths' Company can trace their history to 1180. A statute was granted by Edward I. in 1300. The earliest charter of the Company dates from 1327. It states that it had been theretofore ordained that all those who were of the goldsmiths' trade should sit in their shops in the High Street of Cheap (Cheapside), and that no silver or plate, nor vessel of gold or silver, ought to be sold in the City of London, except at the King's Exchange, or in the said Street of Cheap amongst the goldsmiths, and that publicly, to the end the persons of the said trade might inform themselves whether the sellers came lawfully by such vessel or not; whereas of late not only the merchants and strangers brought counterfeit sterling into the realm, and also many of the trade of goldsmiths kept shops in obscure turnings and by-lanes and streets, but did buy vessels of gold and silver secretly, without inquiring whether such vessel were stolen or lawfully come by, and immediately melting it down, did make it into plate and sell it to merchants travelling beyond seas, that it might be exported; and so they made false work of gold and silver, which they sold to those who had no skill in such things, which abuses and deceptions this charter provides against, by ordaining that no gold or silver shall be manufactured to be sent abroad but what shall be sold at the King's Exchange, or openly amongst the goldsmiths, and that none pretending to be goldsmiths shall keep any shops but in Cheap.

For the purpose of the assay, the goldsmiths had an assay office in the early part of the fourteenth century. The statute of 28 Edward I. enacts that no vessel of gold or silver shall depart out of the hands of the workman until it is assayed by the wardens of the craft, and stamped with the leopard's head, the leopard being at that time part of the royal arms of England.

The London goldsmiths were divided into two classes—natives and foreigners. There were the members of the company and the "allowes," or allowed or licensed. The latter comprised "Allowes Engles," "Allowes Alicant," "Alicant Strangers," "Dutchmen," "Men of the Fraternity of St. Loys," &c. The best artists were probably foreigners. In 1445 thirty-four strangers were sworn and paid 2s. a head. In 1447 Charles Spaen paid 8*l.* 6*s.* 8*d.* to the alms of St. Dunstan to be admitted a freeman, and in 1511 John de Loren paid 20*l.* for the same object.

### DECORATION OF THE DOME OF ST. PAUL'S

A LETTER from Mr. John R. Clayton, on the subject of the Decoration of St. Paul's, has appeared in the *Times*. He says:—"An Artist," writing in the *Times* on the 15th inst. on the Decoration of the Dome of St. Paul's, ventures, in reference to the design for that work by the late Alfred Stevens, to make statements which may reasonably be replied to by another of the craft. Your correspondent tells us that "The committee appointed by the Dean and Chapter ruled, from the first, that the decoration should be founded on the preposterous design by the late Alfred Stevens."

As a matter of fact, within my personal knowledge, the existence of Stevens's design, an undeclared labour of love on his part, was unknown to the committee till the circumstance of his sudden death placed it unexpectedly at their disposal. This design, complacently stigmatised as "preposterous" by your correspondent on his anonymous authority, is one to which Sir Frederick Leighton and Mr. E. J. Poynter, R.A., have significantly pledged their concurrence by rendering aid in its execution. For the profitable reflection of your nameless correspondent I may quote the opinions publicly made by Mr. Poynter on the subject. He has said, "No one is more ready than I am to recognise the superiority of Stevens's genius, and the grandeur, simplicity, and unity of effect in his great invention; or to regret that it cannot be carried out by him in his own way." Further, he speaks of certain groups in the design as being "incomparably the finest things, to my mind, that have been done in this century."

By descending from the general to the particular your

correspondent justifies a doubt as to whether he has seen Stevens's design at all. He says, "It degrades the noble dome into the mere lid of a box"—whatever that may mean—and speaks of the dome as being "cut into slices which are again divided into cameos, odd-shaped little panels, and sham ribs." The "little" panels are mostly of extremely large dimensions, their "odd shapes" are perfect circles, and "ribs" have in Stevens's design no existence.

It is unnecessary further to comment on your correspondent's statements. In conclusion, I will trespass on your space only to express my regret that the committee have excluded from the task delegated to Sir Frederick Leighton and Mr. Poynter the magnificent groups to which the latter has alluded in terms of deserved eulogy. Stevens's conception would be far less the consummate thing it is were it possible to deduct from it this or that ingredient of design without ruin to the whole.

To the groups referred to was due mainly its pervading air of grandeur. Their admirable colour-effect in flesh-tones, like tinted sculpture at recurring distances, is in the general effect both of form and colour an element of simplicity and repose such as cannot be omitted without calamity. These groups are, it seems, objected to because they are nude, although their nudity is simply that of architectonic figures, without any story or suggestiveness of any kind. They fulfil the office of bearers or "telamones," and are like all that Stevens did, as pure in motive as anything that left the hand of John Flaxman or Beato Angelico. To mutilate Stevens's design because of these figures, upon which so much of its masterly character rests, is wholly incomprehensible.

Nudity in some form has been common to all periods of Christian art. In our family picture Bibles, in illustrations to Milton, in painting and sculpture dealing with the history of our first parents, the scenes of the Inferno, and the closing incidents of the Gospel narrative, the admission of the nude has been as familiar as it has been harmless. In St. Paul's itself we find the partial nude in the monumental representation of Dr. Samuel Johnson, and in the sculpture referring to the naval commander Richard Rundle Burgess we see that hero dying stark naked in the arms of Victory. If the course adopted in the exclusion of Stevens's groups is justified, then is the plea utterly delusive that would credit our picture and sculpture galleries with educational and refining influences, in virtue of which large sums of public money are annually granted. It is difficult to comprehend how that which is civilising and refining at Trafalgar Square and South Kensington can be pernicious at St. Paul's.

### WESTMINSTER HALL.

THE following is Mr. William White's opinion of the designs by Mr. Pearson:—

Our requirements may be different from those of the thirteenth and fourteenth centuries, our views of art may be more correct, but nothing will justify a disregard for the historical architecture of such a building as this. The proposal to raise the walls five or six feet for the sake of light is a case in point. It is difficult to understand how such a proposition should emanate from one who at the same time professes the greatest admiration for the interior proportions of the hall, which would be thereby entirely changed. The proportion of height to breadth would then become approximately as three to four, instead of two to three as at present. This would be to the detriment of its apparent spaciousness and to the loss of repose, the absence of which is felt to be so common in modern work. As to the floor, again, we are told that "Sir Robert Smirke did not raise, but, on the contrary, lowered the level of the hall five or six feet down to the original foundation of Purbeck stone." Mr. Butterfield more accurately, quoting from the "Archæologia," clearly shows that it was lowered but 16 inches to the original floor of Richard II. Some of the details under discussion may be of an insignificant nature, and yet are of sufficient importance to distract attention from the merits of the whole case, mixed up as they are with professional as well as non-professional inaccuracies and false conclusions. The proposed introduction of lofty dormers for lighting the roof will no doubt approve itself to some. But its massive grandeur would be destroyed by the introduction of light for displaying its detail. The interior effect of a great national monument of historical antiquity would be sacrificed.

The exterior treatment is a more serious matter. The roof has been called ugly, heavy, barbarous. It is said that it was never meant to be seen from the western side. But its want of beauty and dignity arises wholly from the mutilation and destruction of the substructure. Its embattled parapets have been removed, together with the two-storeyed building which extended the whole length of the Hall, between the buttresses, with its two-light windows and a subordinated embattled parapet, forming an emphatic and picturesque support to a noble roof.

A careful inspection of Mr. Pearson's designs will show any one the conservative spirit and the admirable manner in which he has reproduced these features. The evidences of their former existence have been perfectly traced out, and they are requisite for its proper effect and correct finish, whether this western side is to be permanently exposed or not. If it be absolutely necessary for the public service that this side of the adjoining street should be occupied with public offices, there is nothing more to be said. But the use to which Westminster Hall and its surroundings may be eventually put is of very small moment as compared with the general principles which ought to be followed in its "restoration," if this term must be employed. There is absolutely nothing to show that in the time of Richard II. there were any buildings on this side excepting the transeptal one at the north end and that between the buttresses already referred to. As to the Hall being a disfigurement by the new Houses of Parliament, there need be no fear but what it will hold its own by their side when properly reinstated.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### SIR WALTER SCOTT ON HISTORICAL PAINTING.

IN 1811 Edward Bird, who was afterwards a Royal Academician, proposed to paint a picture illustrative of the scene described in the ballad of "Chevy Chase," when the widows came after the battle. Before that time Bird had confined himself to domestic subjects, and he was uncertain about the costumes and other details for an historical picture. In order to obtain the information, a friend wrote to the author of the "Border Minstrelsy" and "The Lay of the Last Minstrel." Scott, with his customary good nature, wrote the following letter:—

Sir,—I am favoured with your letter, and without pretending to touch upon the complimentary part of it, I can only assure you that I am much flattered by your thinking it worth while to appeal to me on a point of national antiquities. I am very partial to "Chevy Chase," although perhaps "Otterbourne" might have afforded a more varied subject for the pencil. But the imagination of the artist being once deeply impressed with a favourite idea, he will be certain to make more of it than of any other that can be suggested to him. In attempting to answer your queries, I hope you will allow for the difficulty in describing what can only be accurately expressed by drawing, &c. I shall at least have one good thick cloak under which to shelter my ignorance.

I greatly doubt the propriety of mourning cloaks; but a group of friars might with great propriety be introduced, and their garb would have almost the same effect. I am not aware there was any difference between the defensive armour of the Scots and English, at least as worn by the knights and men-at-arms; yet it would seem that the English armour was more gorgeous and showy. They had crests upon their helmets before they were used in Scotland, and at the battle of Pinkie, Patten expresses his surprise at the plainness of the Scottish nobility's armour. I conceive something like this may be gained by looking at Grose's ancient armour, and selecting the more elaborate forms for the English—the plate-armour for example—while the Scots might be supposed to have longer retained the ring or mail-armour. There should not be a strict discrimination in this respect, but only the painter may have this circumstance in his recollection. There are at Newbattle two very old pictures on wood, said to be heroes of the Douglas family, and one of them averred to be Chief of Otterbourne. The dress is very singular—a sort of loose buff jerkin, with sleeves enveloping the whole person up to the throat, very curiously slashed and pinked, and covering apparently a coat of mail. The figure has his hand on his dagger, a black bonnet with a feather on his head, a very commanding cast of features, and a beard of great length. The pictures certainly are extremely ancient and belong to the Douglas family.

Query 2. The knights and men-at-arms on each side wore the sword and lance, but the English infantry were armed with bows, the Scots with long spears, mallets, and two-handed swords. Battle-axes of various forms were in great use among the Scots. The English also retained the brownbill, so formidable at the battle of Hastings, a weapon very picturesque, because affording a great variety of forms, for which, as well as for the defensive armour worn by the infantry of the period, see Grose and the prints to Johnes's "Froissart."

Query 3. Those of the followers of Douglas that are knights and men-at-arms may have their helmets at the saddle-bow, or borne by their pages—in no case in their hands. The infantry may wear their steel caps, or morions; the target or buckler of

the archers, when not in use, was slung at their back, like those of the Highlanders in 1745. I am not aware there was any particular mode of carrying their arms at funerals, but they would naturally point them downward with an air of depression.

Query 4. The plaid never was in use amongst the Borderers, i.e. the Highland or tartan plaid. But there was, and is still used, a plaid with a very small check of black and grey, which we call a *maud*, and which I believe was very ancient. It is the constant dress of a shepherd, worn over one shoulder, then drawn round the person, leaving one arm free.

Query 5. In peace the nobility and gentry wore cloaks or robes richly furred, over their close doublets. The inferior ranks seem to have worn the doublet only. Look at Johnes's "Froissart," which I think you may also consult for the fashion of Lady Percy's garments. Stothard some years ago painted a picture of Chaucer's Pilgrims, which displayed much knowledge of costume.

Query 6. I am not aware there was any prevailing colour among the peasantry of each nation. The sylvan green will of course predominate among Percy's bowmen.

Query 7. The bonnet, the shape of that of Henry VIII. (but of various colours), was the universal covering in this age. The following points of costume occur in my recollection of a Border ballad (modern, but in which most particulars are taken from tradition).

Scott of Harden, an ancient marauding Borderer, is described thus:—

His cloak was of the forest green,  
Wi' buttons like the moon;  
His trews were of the gude buckskin,  
Wi' a' the hair aboon.

The goat-skin or deer-skin pantaloons, with the hair outermost, would equip one wild figure well enough, who might be supposed a Border outlaw. You are quite right respecting the badges, but besides those of their masters, the soldiers usually wore St. George's or St. Andrew's cross, red and white, as national badges. The dogs of the chase, huge dun greyhounds, might with propriety, and I think good effect, be introduced. Suppose one mourning over his master, and licking his face. A slaughtered deer or two might also appear, to mark the history of the fight and the cause of quarrel.

I have often thought a fine subject for a Border painting occurs in the old ballad called the "Raid of the Reidswire," where the wardens on either side having met on a day of truce, their armed followers and the various tribes mingled in a friendly manner on each side, till, after some accidental dispute, words grew high between the wardens. Mutual insult followed. The English chief, addressing the Scottish—

Rose and raxed him where he stood,  
And bid him match him with his marrows.  
Then Tynedale heard them reason rude,  
And they let fly a flight of arrows.

The two angry chieftains, especially Forster, drawing himself up in his pride and scorn, would make a good group, backed by the Tynedale men, bending and drawing their bows. On the sides you might have a group busied on their game, whom the alarm had not yet reached; another half disturbed; another where they were mounting their horses and taking to their weapons, with the wild character peculiar to the country.

This is, sir, all, and I think more than you bargained for. I would strongly recommend to your friend, should he wish to continue such subjects, to visit the armouries in the Tower of London, where there are various ancient, picturesque, and curious weapons, and to fill his sketch-book with them for future use. I shall be happy to hear that these hints have been of the least use or service to him, or to explain myself where I have been obscure.

And I am, sir, your very humble servant,  
Edinburgh, December 8, 1811. WALTER SCOTT.

P.S.—If Douglas's face is shown, the artist should not forget the leading features of his family, which were an open high forehead, a long face, with a very dark complexion.

### THE EGLINTON TOURNAMENT.

THE recent death of the Duchess of Somerset cannot fail to recall the tournament at Eglinton Castle, where her Grace (who was then Lady Seymour) presided as Queen of Beauty. The pageant, like the revival of Gothic architecture, was among the fruits of the Waverley novels and the poetry of Scott. The tournament was held on August 28 and 29, 1839. According to the account of Sir Thomas Dick Lauder the lists were placed in a low-level plain. A strong wooden defence, consisting of palisades 5 feet high, well boarded, enclosed an oblong space of level ground of about three acres in extent—its length being 650 feet, and its breadth 250 feet. The tilting barrier ran longitudinally down the

middle portion of the centre; it was also of wood, and its length was about 300 feet and its height about  $4\frac{1}{2}$  feet. On the eastern, or rather the southern, side were erected three ample wooden galleries; those to the right and left were uncovered, whilst that in the centre, which was called the gallery of the Queen of Beauty, was roofed with planks. A beautiful *loge* projected from the front of it, towards the lists, which was destined for the Queen of Beauty herself, and which was capable of holding thirty or more persons. The gallery to which it was attached was seated for above 800 people, and those to the right and left of it for about 600 each. The galleries were divided by lancet-shaped Gothic arches, richly painted and decorated in scarlet, crimson, and gold. The interior of the principal one was also painted—the seats were covered with crimson cloth—and the back wall was ornamented with a gorgeous antique sort of velvet-looking stuff. The seats rose one behind the other backwards; and as the roof also rose from over the back or uppermost seat forwards, it nowhere interrupted the view from within, whilst the front completely concealed it when the building was looked at from that direction. The Queen's *loge* was fitted up with silken curtains, and draperies of crimson damask. The pavilions of the knights were extremely gay, and fashioned with the greatest possible attention to the descriptions and illuminations in the chronicle. They were shaped with angular sides and roofs, from which projected the quaint-looking mock windows, which were always to be seen in pavilions, and over each of which there was placed a stiff banner, of such a nature as to make the bearings with which it was charged always visible.

When the Queen of Beauty was enthroned the knights and esquires were summoned to pay their devoirs, after which they received from their ladies the favours which were to be worn during the tourney. The knights then returned to their pavilions to complete their arming. After being assisted to their chargers by their esquires, the combatants took their stations on the ground appointed to them, when, the trumpets having again sounded, the herald gave notice that they were ready to do their devoir against any knight who might demand the combat. On this the knight elected to run the first course against the challengers left his tent, armed at all points, and riding up to the gallery, demanded permission to make his essay, which was granted. At the cry of *Laissez les aller*, the trumpets sounded the charge, and the knights ran the appointed courses.

The following were the rules which were prescribed to be observed in the tilting lists:—1. No knight can be permitted to ride without having on the whole of his tilting-pieces. 2. No knight to ride more than six courses with the same opponent. 3. It is expressly enjoined by the Earl of Eglinton, and must be distinctly understood by each knight upon engaging to run a course, that he is to strike his opponent on no other part than the shield, and that an *atteint* made elsewhere (or the lance broken across) will be adjudged foul, and advantage in former courses forfeited. 4. Lances of equal length, substance, and quality, as far as can be seen, will be delivered to each knight, and none others will be allowed. Particular attention will be most earnestly requested to be paid to this injunction, for the general good and credit of the tournament. N.B.—In default of the lances being splintered in any course, the judge will decide for the *atteint* made nearest to the centre of the shield.

*Actions Worthy of Honour*.—1. To break the most lances. 2. To break the lance in more places than one. 3. Not to put the lance in rest until near your opponent. 4. To meet point to point of the lances. 5. To strike on the emblazonment of shield. 6. To perform all the determined courses.

*Actions most Worthy*.—1. To break the lance in many pieces.

*At the Tourney or Barrier*.—1. Two blows to be given in passing, and ten at the encounter.

*Actions of Dishonour*.—1. To break the lance across the opponent. 2. To strike or hurt the horse. 3. To strike the saddle. 4. To drop the lance or sword. 5. To lose the management of the horse at the encounter. 6. To be unhorsed—the greatest dishonour. 7. All lances broken by striking below the girdle to be disallowed.

Nearly all the armour used had an interesting history attached to it. Lord Craven's came from Hylton Castle, and was worn by Baron Hylton at the battle of Cressy. It was of blue-burnished Milan steel, decorated with gold studs or rivets, and inlaid with the same metal, in arabesques. The casque weighed about forty pounds. It may be noted that the only part of the armour which was considered oppressive by the knights was the casque.

The tilting was opened by Captain Fairlie (the Knight of the Golden Lion), and the Honourable Mr. Jerningham (the Knight of the Swan). The latter was successful in the fourth course. They were followed by the Earl of Eglinton and the Marquis of Waterford. Among the encounters was one on foot between the late Emperor of the French (then Prince Louis Napoleon Bonaparte) and Mr. Charles Lamb, in which the Prince was

defeated. The heavy rain diminished the brilliancy of the pageant, and on the first day the banquet had to be postponed owing to the defective construction of the hall. It was, however, held on the second day, and Mr. Bulkeley, the herald, in his "Right Faithfull Chronicle of the Grand Tourney," becomes grandiloquent in describing the scene. Behind each knight, he says, "floated his rich banneret, borne by men-at-arms, attended by retainers. Seneschals of the castle, with rich black velvet dresses, large gold chains and medals, bearing white wands, supervised the whole. There, zealous botteliers, in velvet dresses, with chains less costly, assiduously applied their office. Chamberlains, in black velvet, regulated the courses; while innumerable servitors, in costumes of blue and yellow, the Earl's coronet and initials emblazoned, everywhere attend. The banquet thus, when the four hundred and twenty richly adorned dams and cavaliers were seated, presented a romantic *coup d'œil*, surpassing all imagination had ever formed of feudal magnificence or modern splendour. It had all the nobleness and grandeur that antiquity possessed, adorned in perfect keeping with all the profuse luxury and elegance that the modern boasts. The moving banners, with exchange of challenges to wine—their waving, as the health was quaffed—had an effect peculiarly chivalresque and pleasing."

### LIGHT AND AIR CASE.

THE case of *Visick v. Criddle* was remitted from the High Court of Justice to the Falmouth Court, and was tried lately before Mr. Bere, Q.C., judge.

The plaintiff is the owner of a shop and dwelling in St. Nicholas Street, Truro. The defendant is proprietor of adjoining premises which have recently been rebuilt. Plaintiff applied for injunction to restrain defendant from obstructing light, and also for damages.

For plaintiff, witnesses were called who stated that formerly his premises were occupied by a printer and stationer, and that the room in the rear lighted from the area, which was then the type-room, had not now sufficient light for that business in consequence of the obstruction of the new buildings. Two Truro builders stated that in their opinion the premises had been depreciated to an extent of from 10% to 15% per annum, in consequence of light to windows in the area being obstructed by defendant's building. Mr. T. R. Olver, of Falmouth, produced a model, and gave as his opinion that all the windows of plaintiff's house should have light at an angle of 45 degrees. The judge, however, stopped Mr. Olver in his evidence, and said that it was absurd to suppose that because defendant had pulled down his building he was bound to give plaintiff light at an angle of 45 degrees. The question was what angle of light was given to the windows before the old building was taken down. The judge, moreover, stated that it was a question how far plaintiff had acquiesced during the progress of the work.

The plaintiff said that he was never an acquiescing party, that he had not been consulted, nor had seen the plans, nor had he ever agreed to the buildings, but on the contrary had objected from time to time, so much so that at one period the work was stopped for six weeks.

In cross-examination, the plaintiff stated that his premises were now unoccupied, a portion being required by the Town Council for widening the street. He contemplated making alterations and additions to the premises. It would be impossible to occupy the house while the building operations were in progress. He further admitted seeing defendant's architect on the premises, and holding a consultation with him and defendant in July 1883, when the new building had only just been commenced. The plans were then handed up to plaintiff, who swore that he had never before seen them.

For the defendant it was contended (1st) that plaintiff was an acquiescing party to all that was done; (2nd) that the buildings were completed before the action was commenced; (3rd) that no material damage was sustained.

Mr. Hicks, the defendant's architect, stated that on July 23, 1883, he met, by appointment, on the new building, the plaintiff, defendant, and his partner, Mr. Smith, when plaintiff stated that if the wall were carried up as proposed by the plans his light would be obstructed, and asked that the recess proposed to be on the eastern side of defendant's building should be placed against his windows instead, so as to increase the size of his area, and with that he would be content. He also pointed out the exact position where he would wish to have that recess placed. That was agreed to, and the work was carried out accordingly, at considerable cost to defendant, who had to purchase windows on the eastern side of his building, so as to place recess on western side. Had seen plaintiff from time to time, who did not raise any further objection until after the back portion was roofed in and the front raised to a height of 28 feet. Plaintiff then told him that if the front portion were carried perpendicular to the full height his light would be obstructed. He, then, to avoid blocking the light had the

wall taken down 3 feet to the second floor joists, and a Mansard roof constructed instead. The building was then carried up and roofed and completed before any complaint was made by plaintiff, notwithstanding that he was frequently on the premises. The architect produced sections of the old building and new, showing that the angle of light to plaintiff's window on the ground floor had not been obstructed by the new building.

Mr. Cock, solicitor for defendant, stated that as the plaintiff's premises were unoccupied, he offered to purchase them for defendant at a handsome profit on the original cost, or to give him a half year's rent to avoid further trouble, which was refused.

Other evidence was given in support of the defendant's case.

The judge, in giving his decision said that, from the evidence of plaintiff's witnesses, one might suppose he looked out upon Elysian fields. As a matter of fact, there stood only 23 feet away another building not belonging to defendant 20 feet higher than the top of plaintiff's house, and further, that in an area between plaintiff and defendant, varying from 3 to 5 feet in width, there stood an ancient building two and three storeys in height, so that it was altogether impossible for the plaintiff to have enjoyed uninterrupted light at any time. While it was impossible for him to accept the evidence of defendant's experts, that the construction of this loftier building did not obstruct light at all because the angle of light at the lower windows was not diminished, yet he could form no other conclusion than that there had been no material damage, and his judgment must be for defendant. He also based his decision on another, and perhaps stronger ground, viz., the overwhelming evidence that plaintiff was constantly on the premises, knew all that was being done, and was virtually a consenting party, which debarred him from an injunction to restrain. There was the interview on July 23, but more important was the alteration in defendant's building, as the result by which he agreed to give the plaintiff an additional amount of light. He could not help thinking also that the plaintiff had been premature in his action, for here was a building unoccupied, and was about to be altered. Plaintiff might, at any rate, have waited to see what the result of these proposals would be, and how far it would affect the light in the area. He should, therefore, give a verdict for defendants, with full costs.

### THE VENTILATION OF PRISONS.

FROM the necessity of keeping the cells thoroughly isolated the ventilation of prisons has always been peculiarly difficult. Any system that did not preserve isolation, while insuring a continuous change of air in each cell, was practically useless, as there was really no system by which several cells could be ventilated into one shaft, while sound was prevented from passing from one cell into another. Messrs. Robert Boyle & Son have devised an arrangement which is at once ingenious and simple. There can be little doubt that it will effectually answer the purpose for which it is intended. The system may be described as follows:—Take a "block" or wing of a prison consisting of say three tiers of cells on each side, composed of thirty cells in each tier or row, making 180 in all. Three brick flues, with an internal measurement of 2 feet by 2 feet, are built at equal distances against each of the side walls and carried up above the roof, where they are surmounted with self-acting air-pump ventilators, 3 feet diameter. Three horizontal shafts run along each tier immediately underneath the ceiling and close to the wall. Each of these shafts is connected with ten cells by means of protected openings, varying in size according to the distance of the opening from the upcast shaft, so as to equalise the quantity of air extracted from each cell. Three of these horizontal shafts (one on each tier) are connected with one of the upcast shafts which forms a junction in the centre. The horizontal shafts vary in size according to their proximity to the top of the upcast shaft, so as to equalise the quantity of air drawn from each tier. A ring of gas jets is fixed at the bottoms of the upcast shafts for the purpose of warming them in cold weather, and preventing condensation of the ascending column of foul air.

The peculiar feature in this arrangement is that the ventilating opening in one cell is isolated from the opening in the other cells by means of a metal plate or partition extending from it along the shaft and past the opening of the second cell to it, and so on with the remaining cells. They are all heated in a similar manner, one partition plate overlapping the other the length of two cells from the one it is connected with until the central upcast shaft is reached, where a divisional plate is fixed in the horizontal shaft to prevent the two currents travelling in opposite directions from creating a swirl as they enter the upcast shaft. Each partition plate is deafened round the opening into the cells by means of a double plate packed with sand. The horizontal shafts, as they pass through the cells, are

also protected and deafened by means of a double casing having the intervening space sand-packed.

The advantage of this system is that every cell is equally and separately ventilated, whilst perfect isolation is secured. It is impossible for sounds to pass from one cell into another through the ventilating shafts or openings, whilst as many as from ten to twenty cells can be ventilated by the one pipe and three or four of these lead into one upcast shaft. An important point is, that there are no valves used in connection with any part of the system, so that when once fixed further attention is not required, and the ventilation cannot be interrupted through negligence, as is usually the case where ventilating arrangements are employed that require looking after. Messrs. Boyle have entitled this arrangement the "silent" system of ventilation for prisons, a very appropriate name. Fresh warmed air is introduced into each cell through vertical channels cut in the walls, protected outside and inside with strong iron gratings. These channels open into the galleries on the inside of the building, and are supplied with air from two large openings at each end of the block, through which the fresh air passes over a heating arrangement in cold weather, and is thoroughly warmed before entering the cells through which it must pass before finding an exit. Messrs. Boyle are taking steps to have the system practically tried at one of the large prisons.

### SPRINGLESS PATENT LOCKS

WE have on several occasions called attention to improvements in the construction of door-locks, and we now place before our readers the invention of Mr. C. D. Douglas, of Glasgow, that we believe is destined to play an important part in the future. The original locks under Bromhead's patent, as well as recent improvements introduced into them, are made by Messrs. Charles D. Douglas & Co., 15 Queenhithe, Upper Thames Street, and the prominent feature is that the latch-bolt is actuated in an entirely novel manner, and without the usual companionship of a spring. A metal weight of suitable form is poised in such a manner that its dead-weight is made to act upon the latch-bolt by any movement of the spindle and follower. The slightest turn of the door-handle, either by under or over movement, causes the weight to rise and the door to open immediately, and whenever the handle is released the weight necessarily falls into its normal position and shoots the latch. The action is unerring, and as there is no spring or anything to become weak with use, this arrangement is likely to last for an indefinite period, without the slightest loss of power. Indeed, it seems impossible to conceive a more simple or secure arrangement. When we consider the nuisance so often attaching to latch-bolts, this improvement must be recognised by every one. The now usual concomitant of arranging a lock to be used for either hand has not been lost sight of here, and the latch-bolt can be altered with ease for this purpose, without interfering with the patent action. The locking-bolt is also made more secure by the addition of levers, and these are applied both to rim and mortice locks. Notwithstanding these noteworthy improvements, the prices of these locks are not higher than well-made ones of the ordinary type. The desire evinced by many architects for a reliable lock that will open a door by push or pull of the handle, has induced Mr. Douglas to turn his attention in this direction, with the result that he has produced a lock in combination with the weighted balance (known in Bromhead's patent) that has virtually four actions. A mere push or pull of the handle withdraws the latch-bolt, and a left or right—*ergo*, over or under—turn has the same effect. But a further noteworthy improvement has to be mentioned. When we speak of the annoyances attendant upon lock furniture in general, of knobs becoming loose and falling off, we mention a nuisance of almost daily occurrence, and that every housekeeper has suffered from more or less. That certain improvements have been introduced we are free to admit, and in connection with the last Building Exhibition at the Agricultural Hall we gave an account of the most simple that had then come under our notice; but these improvements are by no means general as yet. It has, however, been reserved to Mr. Douglas to present us with the newest improvement in lock furniture, and the one most likely, as regards both appearance and cost, to come into universal favour, and this is offered in connection with the patent locks we have described. The security in question is obtained by a division of the knob into two halves. A split spindle passes through the lower or smaller half, and is distended by the insertion of a solid wedge rim, the ends of which overlap the spindle, with two notches in the upper or larger half of the knob. The two halves are then screwed together, and no working parts are visible, the whole presenting a solid, firm, and compact appearance. This arrangement is so perfect that the ingenuity displayed in its manipulation will receive universal approbation. Taken in their entirety, the new Douglas locks and lock furniture must be looked upon as containing the most effective improvements in these appliances hitherto introduced.

**Semper and the Development Theory: a Practical Handbook for English Art-Students.**

SIR,—When I wrote my paper on Semper for the Royal Institute of British Architects, I little expected to find in an English audience any sympathy with my master's ideas, for I knew that they would upset the commonly received notions on art, which it is now the fashion to admit as equal to moral dogmas; and I may say that both in the debate which followed my paper and in the remarks which were made to me privately afterwards, my expectations were fully justified, and I felt that I had been a voice crying in the wilderness to no purpose whatever. You may judge of my surprise and joy at the sight of Professor G. Baldwin Brown's letter, which appeared in last week's *Architect*. Soldiers who have been leading a forlorn hope, and have heard the distant cannon of unexpected allies coming to their rescue, will realise my feelings. I look now already on the battle as won. Scotch students, thanks to their native depth of character and their excellent education, are fully capable of appreciating Semper. Thanks to Professor Brown's eloquent appeal, they will be tempted to read Semper's book, and will soon form an army of Semperites capable of rolling back the thick hordes of English *terre-à-terre* prejudice.

On one point I do not agree with Professor Baldwin Brown. It may be because I have not had his experience of the Englishman's incapacity to grasp either theory or principle; but it seems to me that Semper might be presented in an English garb to our fellow countrymen. A translation of Semper is utterly out of the question; the Englishman would never read it, and the Scotchman is sure to know German well enough to prefer reading the book in the original. Nor am I a partisan of a "boiling-down" of Semper's work, as Professor Brown picturesquely puts it; but I should like to see a man with the eloquence of a Ruskin, or the sharp wit of a Thackeray, or the vigorous style of Professor Baldwin Brown himself, give us Semper entirely digested and transformed into English flesh and sinew. In this form, I am confident Semper would do English students an immense amount of good, for his teaching is verily a living spirit, not a dead word. It is a guide to freedom, not to bondage, as so-called practical teaching often is.

To do this, the English author must have so thoroughly assimilated Semper's teaching that his mind and Semper's should have become absolutely one. Anything short of this will be a failure, and, notwithstanding my high esteem for Mr. Stannus's great erudition and talent, I do not think, judging by his remarks, he has in any way imbibed Semper's spirit. When he said that man was born a pattern-making animal, Semper would have answered him, "Man obtained the instinct of pattern-making, thanks to the countless generations of men who have been educated to pattern-making, by the exercise of textile work, such as is exemplified in basket-making." Is Mr. Stannus prepared to consider basket-making as the very keystone to the principles of decoration, and to place our waste-paper baskets as models of style on a far higher level than either St. Paul's or Westminster Abbey? If he is not, then Mr. Stannus can count himself as placed at the very opposite pole to Semper's teaching.

I have myself shown how a simple necklace of jewels could guide one in judging the works of architects, musicians, painters, sculptors, poets, and even novelists like Dickens. I have also shown how the same necklace furnished us with safe principles in such a vexed problem as the decoration of the dome of St. Paul's. Surely a teaching of that kind is far more *practical* than a bundle of recipes for making wall-papers, or even buildings. Semper's aim was that the arts should no more be taught as trades entirely separate from one another, but, on the contrary, as branches of the art of composing, from the parent stem of which every special art draws its vital force.

In speaking of the laws of *Style* as applied to industrial purposes, Semper, it is true, deplores his want of practical acquaintance with the specific qualities and technical handling of various materials; but, at the same time, he shows a knowledge of them which for an outsider like myself seems quite stupendous. His lamentation, I believe, is only the expression of the intense feeling which all men of real learning experience, of the vastness of what is hidden from them compared to the littleness of what they know. No one man has penetrated so far as Semper into the mysteries of all departments of human industry. It is very unlikely that we shall ever see again another art-thinker capable of such a feat; but England might have the honour of completing Semper's book as he wished to see it one day completed by art-loving specialists—such as highly-educated manufacturers. I should propose, therefore, that Professor G. Baldwin Brown undertake the general scheme of the book, the philosophical thread of which he so thoroughly appreciates, and that for each depart-

ment committees be formed in every manufacturing centre of England to gather the special information required; that consuls and travellers be encouraged to inquire into manufactures in all parts of the world; and then, with the help of all the facts collected together, in this way a book will be made, based on Semper's work, which will give an impetus to the arts of England superior to anything we have experienced before.

I am not one of those who admit of English manufacturers making torpedoes, steel-plated ships, cannons, and other war materials for foreign countries; and I beg, therefore, to be excused in saying that, if the book I suggest be ever produced, it should be reserved for private circulation amongst English students alone, and the loan or sale of the same to any foreigner be considered a case of high treason, and punished as such. It is, therefore, a book not to be undertaken on a commercial basis of sale, but to be taken up by the English Government itself in the interest of the British people.

LAWRENCE HARVEY, A.R.I.B.A.,  
Pupil of the late Professor Semper, Medallist of the  
Paris Ecole des Beaux-Arts.

SIR,—Will you kindly allow me space for the following correction. In my communication to you, printed in your last issue, the words "roof of the Pantheon" should be "roof of the portico of the Pantheon."—Yours, &c.,

G. BALDWIN BROWN.

SIR,—Professor Baldwin Brown says that it is impracticable to make a Science and Art handbook out of Semper's speculations. Might not the learned professor go a step further and declare that, for any use an artist can make of the volume on *Style*, it would have been as well if it had never appeared? I have read attentively what Mr. Harvey and Professor Brown have written about the German sage, and also the leading article in *The Architect*. I had some notion before of Semper's ideas, which I had derived from other sources. But I must frankly confess that I am as far as ever from comprehending the *utility* to an architect or designer of anything that was ever formulated by Semper. In saying this I know that I am not peculiar. An art teacher or a treatise on art becomes valuable when he or it enables us to design. Is there any power in Semper's theory to attain that end? I grant that it is interesting to speculate on evolution, and a course of Semper might enable a youth to astonish his amateur friends and lady relatives by the boldness of his speculations. An architect's work does not, however, consist in talking or in theorising, but in designing and planning; and, so far as I am able to make out, Semper throws no light on those subjects. I was surprised that at the Institute no one had the courage to rise and humbly ask Mr. Harvey to explain the advantage to those present of his master's sublimities. All the great artists from Pheidias to Turner have managed to get on without troubling themselves about the origin of art, and it has yet to be demonstrated whether Semperism can convert us into better architects, sculptors, and painters. What is Professor Brown's experience? For my part I prefer to see an architect's office resemble a Renaissance workshop rather than a college common-room, where men argue for the fun of the thing. Life seems to become shorter every day and art longer, for there are greater demands on our hours, and there is more to be acquired. Is it wise to add to our burdens? Carlyle is in disrepute just now, but when it is proposed that we should endeavour to master a book which even the Germans don't care to see completed, it would be well to remember his maxim, "The knowledge that holds good in working, hold thou to that. Nature says yea to that." The evolutionary scheme of Semper may have been original and may be able to withstand the objections of the framers of rival schemes, but unless I am mistaken, the simple test of practicality is fatal to it. If I am in error I shall be grateful if either Mr. Harvey or Professor Brown will condescend to enlighten my ignorance. I am so much of an utilitarian that, to my mind, Semper's theory appears to be about as valuable to an artist as speculations on the digestive apparatus of the armour-plated fishes of the Red Sandstone era would be to a man who had been invited to a Christmas party. An ordinary mortal could enjoy mince pies, although he might be ignorant of his relation to the beings which are fossilised, and in the same way an architect ought to be able to make a commodious house without knowing anything of ancient or modern stitching. Or, to put the case differently, can we believe that Tennyson or Browning would be able to write better poetry after thinking for a few years on the language in which the primitive needlewomen were accustomed to abuse one another? Once upon a time it used to be recommended by potent, grave, and reverend architects (who spoke by hearsay) that every pupil should endeavour to come up to the Vitruvian standard in the universality of his knowledge. Afterwards men grew more sensible, and the standard was not enforced upon all. But the honest Roman, although he professed to believe in the infinite expansiveness of an architect's

mind, is nowhere if compared with Herr Gottfried Semper. Would it not be wiser to leave the pair to enjoy the retirement from life which they have both laboured so hard to deserve?

Yours obediently,  
CUI BONO.

#### Design for Newcastle Hospital for Infectious Diseases.

SIR,—Will you allow me to point to a misprint in the description of the above plate illustrated last week. It read, "The axes of the wards are placed east and west, so as to have no intervening spaces swept by the prevailing winds." It should read, "The wards are placed east and west, so as to have the intervening spaces swept by the prevailing winds."

I would also point out that it is not mentioned on the plate that the drawing was awarded the second premium in the late competition for the Infectious Hospital at Newcastle, and also to the omission on the drawing of Mr. Walter J. H. Leverton's name as joint-author of the design.

I am, &c.,  
Bedford Row House, W.C. MARK J. LANSDALL.

### REVIEWS.

EGYPT AND THE WONDERS OF THE LAND OF THE PHARAOS. By WILLIAM OXLEY. Trübner & Co.

This book relates to theology rather than to architecture. The author is a spiritualist, and believes "that there was and is an affinity between ancient Egypt and modern Great Britain," or, in other words, Christianity is but a form of Osirianity. There is an addendum relating to Egyptian architecture by Mr. William Menzies, an architect, which concludes with an expression of "the most reverential respect for those great and daring men who so long lived, worked, and died on the banks of the Nile."

THE APPRAISER, AUCTIONEER, BROKER, HOUSE AND ESTATE AGENT AND VALUERS' ASSISTANT. By JOHN WHEELER. Fifth Edition. By C. MORRIS. Crosby Lockwood & Co.

It may be said of Wheeler's Pocket Assistant that it contains the value of everything from a needle to an anchor, and from a brick to a real estate. The little book must be indispensable to an auctioneer or a broker, and use will often be found for it in a surveyor's office.

### CHURCH BUILDING AND RESTORATION.

**Dundee.**—The Tay Square church has been lately undergoing a thorough renovation and repair. The improvements have been carried out from plans prepared by Mr. McCulloch, architect, by the following tradesmen:—Mason, Mr. Duncan; painter, Mr. Wm. Brown; plasterer, Adam & Son; upholsterer, &c., Smith & Son. Mr. Hunter, architect, has been entrusted with the designs for the halls, session-house, &c., and the work will be proceeded with at once.

**Hamilton, N.B.**—A new Established Church at Quarter, near Hamilton, has been opened. The new edifice is an elegant Gothic structure of the Early Decorated period, and is comfortably arranged internally to accommodate 430 sitters. Mr. John B. Wilson, Bath Street, Glasgow, is the architect.

**Maidenhead.**—A Roman Catholic church, dedicated to St. Joseph, has been opened. Only a portion of the plan has been carried out, a proposed square lantern tower not having been commenced. The cost of the work now completed, which has been executed in a substantial manner by the builders, is about 1,500*l.* The building is of red brick and flint stone, the interior surface of the walls being also of red brick. Mr. Leonard Stokes, London, is the architect. Messrs. Silver, Sons, & Filewood, Maidenhead, were the builders.

**Wolverhampton.**—A quarterly meeting of the Wesleyan Circuit was held on Monday, when the subject of church extension was considered. In 1870 the chapel property in the town was valued at 18,000*l.*, and the debt upon it was 4,500*l.* The same class of property is now worth 32,000*l.*, and the debt upon it is only 175*l.* It is intended to spend a further sum of 12,000*l.* in the erection of new and in the extension and improvement of existing chapels. Upon the Circuit Chapel in Darlington Street 2,300*l.* will be expended in the building of a spacious assembly or lecture-room and a suite of new classrooms, and in renewing and otherwise improving the interior of the chapel, at a cost of 4,000*l.* The present chapel at Whitmore Reans will be replaced by one to accommodate 800 worshippers. A school-chapel and class-rooms are to be put up in Waterloo Road North, where 350 people are to be provided for, and sufficient land is to be secured for a subsequent extension. This will involve a present outlay of 2,000*l.* The existing chapels at Blakenhall and at Wednesfield are to be replaced by new structures, to accommodate, the first, a congregation of 450 persons, the cost being 1,500*l.*; and the other

a congregation of 400, the outlay in this case being 1,200*l.* Upon a central plot of land, on the new Corporation estate at Spring Fields, a structure adequate to the needs of 350 people will be erected, at an outlay of 1,000*l.* As much as 9,500*l.* have been already promised, and the contributions will be paid within four years.

### GENERAL.

**The Queen** has subscribed 25*l.* towards the cost of restoring the Queen Eleanor's Cross at Northampton.

**An Exhibition of Works of Art**, organised by the Parks and Galleries Committee of the Glasgow Town Council, has been opened in the halls attached to the South-Side Baths, Gorbals. Among the pictures are eleven which have been lent from the National Gallery.

**M. Chapu** is to be entrusted with the commission of the statue of Gustave Flaubert, which is to be placed opposite the Musée in Rouen.

**A Statue of Mr. Gladstone**, by Mr. Bruce Joy, has been presented to Liverpool by Mr. Sitt, of Birkenhead.

**Professor Baldwin Brown** will deliver a lecture on Monday next, at the South Kensington Museum, on Gottfried Semper and his Artistic Theory.

**An Almanack**, with illustrations, which are accompanied by apt quotations from Shakespeare, has been issued by the Accident Insurance Company, of which Mr. Henry Currey is chairman.

**Lieut.-Col. H. C. Seddon, R.E.**, who has held the appointment of chief instructor in construction and estimating at the School of Military Engineering, Chatham, since 1879, has been appointed to the Staff, for particular service. His successor is Major A. J. Cunningham, lately employed in connection with buildings and roads at Lucknow.

**Two Stained-glass Windows** have been placed in White-lands College Chapel. They have been executed by Messrs. Morris & Co., from designs by Mr. E. Burne Jones.

**Cast of the Gates** in the Church of S. Maclou, at Rouen, which are attributed to Jean Gougon, have been added to the Gallery of Sculpture in the Trocadero.

**The New Flemish Theatre**, in Brussels, is to be lighted by electricity under the direction of the architect, M. Baes.

**Mount Stuart House**, of which Dr. Rowand Anderson is architect, although incomplete, is at present temporarily occupied by the Marquis of Bute. The apartments used are in the southern end of the building, and overlook the Firth of Clyde.

**A Company** has been registered, which proposes to construct a viaduct across the English Channel. The proposed capital is only 200,000*l.*

**A Chemical Laboratory** is to be erected in Downing Street, Cambridge, from the designs of Mr. J. J. Stevenson. The frontage will be about 200 feet.

**Mr. George Trist**, head of the old-established firm of Messrs. Norton, Trist, Watney & Co., auctioneers and surveyors, died a few days ago in his sixty-ninth year. Mr. Trist was constantly employed in arbitrations to determine the value of City property required for railway and street improvements. He steadily opposed the rapidly-growing practice of sharing commissions between auctioneers and solicitors.

**Messrs. Whitmore & Reeves**, of London and Chelmsford, have been appointed architects for the New Winter Palace at Tenby, and are now preparing the working drawings.

**A Handsome Polished Brass Eagle Lectern**, which has been justly described by competent critics as being one of the finest specimens of art work in the Midland counties, was presented to the ancient parish church of Aston, near Birmingham, at Christmas. It has been manufactured by Messrs. Jones & Willis, of Birmingham and London.

**Wood Block Flooring.**—The blocks imported by Messrs. Vigers Bros., of Chelsea, of the London Board School pattern, have recently been adopted for the following buildings:—Edmonton Town Hall, coffee palace at Bethnal Green Museum, Harrington Church, Cumberland; West London Hospital, Hammersmith; Nazareth House, Hammersmith, and numerous Board schools.

**The Incorporated Church Building Society** now holds upwards of 79,000*l.* on trust as Repair Funds for 326 different churches. Last year grants amounting to 6,000*l.* were made towards the erection of twenty-eight churches, the rebuilding of ten, and the enlarging or otherwise improving the accommodation in fifty-five existing churches. These works called for a further sum of 278,135*l.*

**Messrs. Waygood & Co.**, of Falmouth Road, S.E., have received instructions from Mr. W. A. Daw to erect a direct-acting hydraulic passenger-lift at De Vere Gardens, Kensington, being the second that firm have supplied. Messrs. Silber & Fleming have also given Messrs. Waygood & Co. the contract for another direct-acting hydraulic lift for their premises at 71 Wood Street, of similar dimensions to that erected for them at 61 Wood Street, and, like that one, to be worked from the Hydraulic Power Company's mains.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JANUARY 3, 1885.

## SUBSCRIBERS' ORDER FORM.

To the Publishers of THE ARCHITECT, 175 Strand, London, W.C.

Add my Name to your List of Subscribers, and herewith receive Nineteen Shillings and Sixpence in payment of the First Year's Subscription.

Name \_\_\_\_\_

Address \_\_\_\_\_

Date \_\_\_\_\_

\* All Subscriptions are payable in advance. Cheques to be drawn in favour of GILBERT WOOD and Co., and Post-Office Orders to be made payable at the Lombard Street Post Office, E.C.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TENDERS, ETC.

\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Reporter to THE ARCHITECT."

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD & Co., 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publishers desire to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### ADVERTISEMENT SCALE.

|                           |        |
|---------------------------|--------|
| For Two Lines and under   | £0 2 6 |
| For every Additional Line | 0 0 6  |
| For Quarter Page          | 2 10 0 |
| For Half Page             | 4 10 0 |
| For a Page                | 8 8 0  |

pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application to the Publishers, at the Office, 175 Strand, London, W.C.

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publishers will be happy to forward, for 19s. 6d. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

## APPOINTMENTS VACANT.

AYLESBURY.—Jan. 3.—The Local Board require a Surveyor for the Urban Sanitary District of the Parish. Salary, 104*l.* per annum. Mr. George Fell, Clerk to the Local Board, Aylesbury.

BOLTON.—Jan. 6.—Applications are required for the Office of Borough Surveyor. Mr. R. G. Hinnell, Town Clerk, Bolton.

CHESHUNT.—Jan. 5.—Applications are required for the Office of Surveyor for the District. Salary, 175*l.* per annum. Mr. James Death, Clerk to the Local Board, Cheshunt.

COLWYN.—Jan. 6.—The Radnorshire County Roads Board require Applications for the Appointment of a Surveyor for the District of Colwyn. Mr. W. Stephens, Clerk to the Board, Presteigh.

SODBURY.—Jan. 12.—Applications are required for the Appointment of a Surveyor. Salary 300*l.* per annum. Mr. J. Trenfield, Clerk to the Highway Board, Chipping Sodbury.

## COMPETITIONS OPEN.

CHELSEA.—Feb. 25.—Plans are invited for Additions to the Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, Clerk of the Vestry, King's Road, Chelsea.

KING'S NORTON.—Jan. 15.—Plans for the Erection of Four Cottage Homes upon Lands situate at Shenley Fields are required. Mr. Ralph Docker, Clerk of King's Norton Union, Colmore Row, Birmingham.

KING'S NORTON.—Jan. 15.—Plans are invited for the Erection of a Laundry, at the Workhouse, Selly Oak. Mr. Ralph Docker, 57 Colmore Row, Birmingham.

LONDON.—Jan. 7.—Architects experienced in the designing and erection of factories or breweries, and desirous of taking part in a limited competition, are invited to send a statement of the nature and extent of their experience in such work to Y. Z., 1,245, Advertising Offices, 167 Fleet Street. The proprietor pro-

poses to select not fewer than six or more than twelve competitors. A member of the Council of the Institute of Architects has undertaken to assist him in the choice of names, the preparation of the instructions and conditions of competition, and the selection of the designs.

LONGTON.—Feb. 20.—The Longton School Board are about to erect two sets of schools at Normacott and Florence, each to accommodate 700 scholars (220 boys, 220 girls, and 260 infants), and invite architects in the Potteries and Newcastle to send in designs and estimates. Mr. Geo. C. Kent, Clerk to the School Board, Longton.

WINDSOR.—Feb. 28.—The Town Council of New Windsor invite designs for a panel of tapestry to be fixed in the Guildhall. Three prize-winners will be invited to compete for the cartoon from which the panel of tapestry will be woven. The Town Clerk, 4 Park Street, Windsor. Competitors must be resident within five miles of the Guildhall, Windsor.

## CONTRACTS OPEN.

ABERGAVERN.—Jan. 6.—For Additions to Holy Trinity Church. Mr. Thomas Nicholson, Architect, Hereford.

AKROYDON.—Jan. 9.—For Building Seventeen Houses and Shop. Mr. James Farrar, Architect, Crossley Buildings, 29 Northgate, Halifax.

ALTOFTS.—Jan. 6.—For Alterations and Additions to Cemetery Premises. Mr. Leathley, Clerk to the Local Board, Altofts.

ASHTON-ON-MERSEY.—Jan. 27.—For Leveling, Paving, Metalling, and Channelling Streets. Mr. A. McKenzie, Surveyor, Broomfield Road, Hale, near Altrincham.

BALBY WITH HEXTHORPE.—Jan. 14.—For Furnishing Desks and other Apparatus for Board School. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

BERMONDSEY.—Jan. 9.—For Additions, Machinery, and Engineering Works at Public Baths. Messrs. G. Elkington & Son, Architects, 95 Cannon Street, E.C.

BERWICK.—Jan. 8.—For Providing River and Land Stones, Breaking and Laying on Stones, &c., for the year. Mr. E. Willoby, Clerk to the North and Islandshire Highway District Board, Berwick.

BEXHILL.—Jan. 15.—For Enlarging and Part Rebuilding Church of St. Mark. Messrs. Riches & Esam, Architects, Station Road, Bexhill.

BIRKENHEAD.—Feb. 5.—For Supply and Erection of Two Pumping Engines, with Pumps and Steam Boiler, at Spring Hill Waterworks. Mr. W. A. Richardson, Water Engineer, 50 Hamilton Square, Birkenhead.

BLACKBURN.—Jan. 10.—For Supply of Material, Labour, Tools, &c., for the year, including Paving Setts, Sidestones, Channel Stones, and Circular Curbs, Flags, Ashlar Wall Stone and Landings, Stone for Underbedding and Hand-pitching, Granite (Macadam and Circular Curbs), Limestone (Cob and Broken) and Lime, Cement, Gravel and Sand, Bricks and Clay, Earthenware Pipes, Wrought Iron (Bar, Sheet, and Hoop) and Steel. Mr. J. B. McCallum, Borough and Water Engineer, Municipal Offices, Blackburn.

BLAYDON-ON-TYNE.—Jan. 8.—For Construction of Two Covered Service Reservoirs, &c., and Laying Cast-iron Pipes (13,800 yards), Supply of Cast-iron Pipes, Valves, Hydrants, &c. Mr. H. Laws, C.E., 18 Grainger Street West, Newcastle-on-Tyne.

COOKNEY.—For Building Church. Mr. J. Russell Mackenzie, Architect, 259 Union Street, Aberdeen.

## R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

## INEXPENSIVE &amp; PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5*s.* for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

**ARTHUR W. BLOMFIELD, Esq., Architect.**

"I have used the Air-Pump Ventilator of Messrs. Robert Boyle & Son with satisfactory results. I believe the System to be a sound and good one, and capable of varied application with success."

**The Late Sir GILBERT SCOTT, Architect.**

"I have used your Patent Self-Acting Air-Pump Ventilators with complete success."

"From experience of them in my own house, and other buildings, public and private, where they have been applied under my direction, I can confidently, and will always have great pleasure in recommending them."

**ARTHUR CATES, Esq., F.R.I.B.A., Architect to the Crown, &c.**

"I have used your Air-Pump Ventilator with satisfactory result. Those fixed under my direction at the Library of the Inner Temple have realised my expectations, and completely fulfil the object which I had in view. I consider this application of them a severe test, and the success which has attended it confirms the statements which you make as to their efficiency."

**Sir WILLIAM THOMSON, F.R.S.**

"I have seen several different forms of Mr. Boyle's Air-Pump Ventilator in actual operation, and have much pleasure in testifying to their efficiency. They thoroughly realise the favourable anticipations which I formed from experiments on models shown to me by Mr. Boyle. Having one fitted up in my yacht, I find it has caused a very decided improvement in the draught."

**The Late Prof. MACQUORN RANKIN, Professor of Engineering, Glasgow University.**

"There is no time throughout the whole year but when there is a sufficient movement of the atmosphere at the level of the house-tops to cause the Air-Pump Ventilator to act."

**Prof. GRANT, LL.D., Glasgow University.**

"They are constructed on sound scientific principles, act in strict accordance with the laws of nature, and cannot fail to operate."

**Dr. B. W. RICHARDSON, F.R.S.**

"Since these excellent Ventilators have been introduced, we have now got a perfect method of ventilation."

**W. EASSIE, Esq., C.E., F.L.S., &c., &c., Author of "Healthy Houses," &c.**

"I have often made use of the Air-Pump Ventilator for soil-pipes, &c., and consider it most admirable. Its action is continuous, and it cannot possibly get out of order. It is decidedly the most efficient fixed foul air withdrawing medium that I ever met with."

**ERNEST TURNER, Esq., F.R.I.B.A., &c.**

"Boyle's Patent Self-Acting Ventilator, which does not revolve, is the best Soil-Pipe Ventilator that I know of."

FIRST PRIZE MEDAL (SILVER), THE HIGHEST AND **ONLY AWARD** GIVEN FOR VENTILATORS OR SANITARY APPLIANCES, SANITARY AND ART EXHIBITION, EASTBOURNE, OCTOBER, 1884.

HIGHEST AND ONLY PRIZE (SILVER MEDAL), AWARDED TO VENTILATORS, INTERNATIONAL EXHIBITION, LONDON, SEPTEMBER, 1884.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

3 Silver and 4 Bronze Medals Awarded for Sanitary Appliances.

**HENRY CONOLLY,**

LIMITED,

**MANUFACTURING SANITARY ENGINEERS,***Call the attention of Architects, Surveyors, and Builders to their Closets,**The advantages of which will be readily seen by the accompanying Illustration.*

THE  
“SAFETY”  
VALVE  
WATER-CLOSET

WITH  
CONOLLY'S  
REVERSIBLE TRAP

(Patent No. 3754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet, the base of the collar being round is flanged **A**; this is attached to a corresponding flange **B**, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate trap is employed.

The “Safety” Valve Water-Closet, like the “Nestor” as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within  $1\frac{1}{2}$  in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

**CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.****53 & 55 Hampstead Road, 169 & 171 Drummond Street.****WAREHOUSES—TOLMER'S SQUARE, N.W.**

LEEDS.—Jan. 8.—For the Year's Supply of Cast-iron Pipes, Small Castings, &c. Mr. E. Filliter, 16 East Parade, Leeds.

## INTERNATIONAL HEALTH EXHIBITION, LONDON, 1884.

GOLD, SILVER, and BRONZE MEDALS were awarded to

**BUCHAN'S**

**PATENT SANITARY AND VENTILATING APPLIANCES.**

GOLD MEDAL

When tested in London by Mr. S. S. Hellyer, BUCHAN'S INDUCED CURRENT FIXED VENTILATORS excelled all the other leading makers' Cows and Ventilators by 34,000 feet in twenty-one hours—and is still the Champion.

"The Best Cow is one of Mr. Buchan's."—"Ventilation and Heating," by Dr. BILLINGS.

J. MURRAY ROBERTSON, Esq., Architect, Dundee, on Nov. 8, 1884, writes:—"I have great pleasure in adding my testimony to the merit of your Ventilators. I have now used a very large number of them, and have found them to work admirably."

"W. P. BUCHAN, Esq.—SIR,—Your Disconnecting Traps and Ventilators and also the Grease Traps have given the utmost satisfaction here since they were introduced."

"Balmoral; Nov. 27, 1884.  
"JAMES ANDERSON, Clerk of Works."

# WENHAM & WATERS'

# PATENT RADIATORS

FOR

## HOT-WATER HEATING APPARATUSES.

---

The purpose of this invention is to improve upon the present system of heating by hot water. The object of the invention is to retain the largest outside radiating surface with the smallest possible quantity of water compatible with simplicity of construction.

The pipe of the illustration (see page xxi), instead of being of the usual circular shape, is of a cruciform pattern, and represents the same outside surface as an ordinary 4-inch cast-iron hot-water pipe; but by its construction the internal bore is only equal to the size of 1½-inch round pipe. By containing only the smallest quantity of water an enormous saving of fuel is effected, inasmuch as only about one-sixth part of the quantity of water has to be heated; and having this smaller quantity of water only to deal with, the water circulates through the entire system six times quicker than with the ordinary circular pipes, and by so doing a more regular and even temperature can be maintained.

The pipe is made so as to be adapted for coils as illustrated (see page xxi), or to be connected together by means of a flange for fixing in trenches or continuous run of pipe, as is ordinarily done for greenhouses or churches. When it is used above ground as a coil it can be finished, ground, and Berlin-blackened or electro-bronzed, or in other modes to suit different styles of decoration and architecture, and is capable of being made an ornamental object, occupying but little space, instead of the unsightly disfigurement of the ordinary pipes, which have to be covered with expensive coil cases.

---

The following are among the advantages of the Cruciform Pipe and Radiator:—

**FIRST COST IS NOT ABOVE THAT OF ORDINARY PIPES.**

**A SAVING OF AT LEAST 50 PER CENT. IN FUEL.**

**MAIN FLOW AND RETURN PIPES MAY BE MUCH SMALLER THAN WITH ORDINARY PIPES.**

**SMALLER, AND CONSEQUENTLY LESS EXPENSIVE; VALVES MAY BE USED.**

**SMALLER BOILERS REQUIRED, WITH A SAVING OF BRICKWORK IN THE SETTING.**

---

## CARPETS.

SPECIAL IN DESIGN AND QUALITY.

### MATS.

TRELOAR'S IMPERIAL MATS.

TRELOAR and SONS are the manufacturers of the Imperial Mats. They are made entirely of Coir, or Cocoa-nut Fibre, and without the use of any dye or bleach. Skeleton, Union, Indiarubber, and Scraper Mats in great variety. The patent Mat and Foot Brush, a novel combination.

### TRELOAR'S FLOOR-CLOTH

ALL WELL SEASONED AND OF THE  
NEWEST ARTISTIC DESIGNS.

"Well seasoned" as applied to floor-cloth is not an unmeaning term, for good floor-cloth, like good wine, requires age.

A vast improvement has taken place lately in the patterns, and many of these are now everything that can be desired.

### TRELOAR'S LINOLEUM.

Like ordinary floor-cloth, Linoleum requires age, and when properly seasoned will wear a long time. The ground is brown or red, with a large assortment of patterns. Linoleum is made two yards wide, but can be fitted together so as to present an unbroken surface. All the Linoleum by other makers is kept in stock. Experienced fitters sent to any part.

TRELOAR and SONS have been awarded NINE PRIZE MEDALS for their FLOOR COVERINGS—the first at the INTERNATIONAL EXHIBITION, 1851, and the last at the HEALTH EXHIBITION, 1884.

# THE GUINEA CARPET,

"THE CHEVIOT,"

Is all Wool, is nearly 3 yards by 2½, is Seamless and bordered all round. Kept in stock in every variety of pattern and colouring, in twenty other sizes. Protected by Trade Mark ("THE CHEVIOT,") and only to be obtained from

**TRELOAR & SONS.**

THREE MEDALS ONLY were awarded at the Health Exhibition for ENGLISH CARPETS,

**GOLD. SILVER. BRONZE.**

THESE THREE PRIZE MEDAL CARPETS CAN BE SEEN AT

**TRELOAR & SONS, 68, 69, 70 LUDGATE HILL, E.C.**

# The Architect.

## THE WEEK.

THE death of the Bishop of LONDON, which occurred rather suddenly on Tuesday morning, will cause general regret. Bishop JACKSON was not more enthusiastic about church building than about other matters, but he was eager enough to have churches built in new districts, and to attain that end he was willing to sacrifice City churches. His apparent indifference to the architectural interest of buildings for which a congregation could not be found was the cause of much expostulation with his lordship. Bishop JACKSON presided over the See of London during fifteen years, and in that time he has consecrated one hundred and fourteen new churches, of which twenty-nine were erected in the last five years. In his last charge the bishop said that fifty additional churches were still required for the metropolis, and that sites for thirty had been secured.

THE new year always brings additions to the Legion of Honour. The representatives selected by the Minister of Fine Arts for January 1885 have been M. PAUL ARÈNE, M. MARQUESTE, sculptor, and MM. GABRIEL FERRIER and LHERMITTE, painters. Architecture has not been recognised in the nominations this year, unless M. TOULIN, director of civil buildings, is considered. Engineering is honoured in the person of M. MARIN, Ingénieur en chef des Ponts et Chaussées, who for thirty years has been connected with the Western Railway Company.

MR. H. GIBSON, of North Shields, has obtained first place in the competition for the Tynemouth Workhouse Extension. The second premium of 20*l.* was awarded to Messrs. CLARK & MOSCROP, architects, of Darlington. The amount to be expended is not to exceed 20,000*l.*

It is not surprising that exaggerated rumours have been heard about the destruction of buildings in Spain by the earthquake. In Malaga there have been settlements in several of the churches, and buildings in Beznar, Langaron, and Murchas have suffered. But it appears there is no reason to believe that more than the slightest injury has arisen either to the Alhambra in Granada, or the great Giralda tower of Seville Cathedral, although statements to the contrary have been printed in foreign papers. The town of Alhama, on the borders of the province of Granada, which is associated with Moorish history and legends, has been nearly all destroyed.

A CASE which suggests the risks of architects has been just settled in Stratford-on-Avon. The School Board erected a building from plans which had been prepared by Mr. MILNE, a local architect, and were duly approved by the Education Department. The contractor was Mr. HARRIS, of Stratford-on-Avon, and a clerk of works was employed. On the completion of the building, the architect gave a certificate declaring that the work had been properly carried out according to the drawings and specification. There are always honorary inspectors for a public building, and the report was spread in the town that the contractor had contrived to evade some of the conditions. An independent architect was called in to report on the case, and the Board came to the conclusion that nearly 400*l.* had been overpaid owing to the difference between the specified materials and those which had been used. The Board declined to pay the balance which was claimed. An action was commenced by the contractor, and as he was in possession of the architect's certificate it would be difficult to resist his claim. A compromise was effected, which will be understood from the following resolution, which was adopted at the last meeting:—"Resolved, that the Board accept the offer of Mr. MILNE of 200*l.* cash in full discharge of all liabilities, upon condition that the Board are released from payment of 145*l.* 3*s.* 2*d.* stated to be due from them to the contractor, Mr. HARRIS, being equivalent to the sum of 345*l.* 3*s.* 2*d.* paid to the Board." To the ratepayers this may seem a satisfactory conclusion; but, on public grounds it is to be regretted that the case has not been fought out.

The charge is nothing short of a slur on architects and builders throughout the country, for it will be alleged that misdeeds in other places have escaped owing to absence of watchful members on the School Boards. When a prejudice arises against an architect or a builder it is difficult to live it down, and we believe that Mr. MILNE and Mr. HARRIS would have found it better in the end if they had succumbed to clamour.

WE are glad to find that a suggestion that was lately offered in this journal will be realised, as Professor G. BALDWIN BROWN has received a commission from the Science and Art Department to prepare a translation of SEMPER's book on "Style." There can be no question about the Professor's qualifications to undertake the work. The extract in his article on SEMPER is evidence that the translation will be idiomatic and readable. The appearance of the book under the auspices of the Science and Art Department will aid in extending the influence of SEMPER's teaching, and it will be also a memorial of his connection with the Government Art Schools.

THE ordinary Wednesday evening meetings of the Society of Arts will recommence on the 14th inst., when Mr. R. H. TWEDDELL will read a paper on "The Employment of Hydraulic Machinery in Engineering Workshops." The following are the papers arranged for subsequent evenings:—January 21, "Labour and Wages in the United States," by Mr. D. PIDGEON. (On this occasion the Hon. J. RUSSELL LOWELL, the American Minister, will take the chair.) January 28, "The Influence of Civilisation upon Eyesight," by Mr. R. BRUDENELL CARTER, F.R.C.S.; "The History and Manufacture of Playing Cards," by Mr. GEORGE CLULOW; "The Musical Scales of Various Nations," by Mr. A. J. ELLIS, F.R.S.; "A Marine Laboratory as a means of Improving Sea Fisheries," by Prof. E. RAY LANKESTER, F.R.S.; "Recent Improvements in Coast Signals," by Sir J. N. DOUGLASS; "The Evolution of Machines," by Prof. H. S. HELE SHAW; "Education in Industrial Art," by Mr. CHARLES E. LELAND; "The American Oil and Gas Fields," by Prof. JAMES DEWAR, F.R.S.; "Past and Present Methods of Supplying Steam Boilers with Water," by Mr. W. D. SCOTT MONCRIEFF.

IN an article on the building trade which appeared last week we spoke of prejudices against building as an investment, the subject being considered solely on financial grounds, and with ample knowledge of what is now believed in the City. What was then said has been confirmed in the suspension of Mr. ARTHUR SMITH, a contractor who is well known from the extent of his building operations in the suburbs of the metropolis. A man of his shrewdness is hardly likely to have been carried away by a desire to build houses for the public benefit at a great loss to himself, and a valuation of his property has shown that it can realise a large surplus, even under the unfavourable conditions of a forced sale. Several of Mr. SMITH's principal creditors entertained the fullest confidence in his transactions, and were willing to allow the business to be continued. But the influences to which we referred last week operated among a few creditors, and in consequence a splendid property, with a well-managed establishment, have to be brought into the Bankruptcy Court. From what we can infer this course is altogether unnecessary, and will involve needless expense to the creditors. Mr. ARTHUR SMITH well merits the sympathy of all business men. He has been sacrificed to what is practically a senseless panic, and it is to be hoped that he may not have many fellow-sufferers in the building trade.

THE Municipal Council of Paris have this year voted liberal sums for education in art and science. Drawing comes first with a credit of 974,900 frs. Then there is singing, which costs 281,759 frs. The schools of physics and chemistry, as applied to industry, cost 204,200 frs., the professional school in the Boulevard Diderot 141,920 frs., and the technical school in the Rue de Reuilly 92,300 frs. A sum of 4,000 frs. is entered for travelling scholarships in art. Gymnastics is credited with 322,000 frs. These sums form but a part of the outlay on science and art.

## THE EDUCATION OF ARCHITECTS.

ALTHOUGH the human race has been occupied with experiments in education for three or four thousands of years, it has not yet been able to determine what is the best way to bring up a boy or a girl. Every paterfamilias cannot fail at times to contrast the difference between the system which is found in his son's school, and that which prevailed in his day, and periodically when he glances over the "extras" in the accounts, he probably is not convinced of the advantages of the former. For years past revolutions have been in progress in all places for education, from universities to reformatories, and there are no signs that they will ever come to an end. Science schools, medical schools, law schools, art schools, have all become dissatisfied with established methods, and are seeking for something of a different kind. Even theology, which is not a progressive science, has come under the power of the reforming spirit, and things are now considered to be essential in the ecclesiastical curriculum, which were entirely unknown to old-fashioned divines.

It is not surprising, then, that the Architectural Association should devote an evening to professional education. That is a subject which has been often ventilated in Conduit Street, but it is well that the younger generation should have an opportunity to express their opinion upon it. Many members of the Association must be just beginning to realise that their dream is over. Architecture may have appeared to them a very attractive profession, and during their days of pupilage they, like men who are now grisly and cynical, imagined probably that they were about to astonish the world. But the commissions for the palaces and cathedrals will not come, and as one sits lonely in a small office on a winter's day, it is difficult to believe that one's training has been exactly of the kind that is best adapted to cope with an obtuse generation. When education is to be considered, it would be well to have the opinions not only of the young men who are beginning to test the worth of their pupilage, but of youths whose terms have not yet expired. We should have liked to have heard the objections that could be raised by those who have had, say a year's experience. When we have once gone into the world, it is not easy to say in public that we represent a defective plan of education, or to confess that we have been allowed few opportunities to see works in execution. But a pupil could, without injury to himself, rise and say that he has not had a word of advice from his master, or that his time is mainly occupied in tracing drawings, and whatever he might reveal in this way could not injure him hereafter. It has been objected from time to time that the speakers at the Association meetings are hardly representative of what may be called the student class, and lately more encouragement has been given to tyros; but at such a meeting as the last the opinion of the youngest man in the room was entitled to serious consideration. It must be said, however, that the meeting was almost improvised, and while to a part of the auditors the question was what is the most efficient way to improve the Association, supposing the Institute is willing to advance funds, to others it was the vast subject of professional education in its entirety.

Either aspect of the case would require more space for consideration than an article will admit, and we therefore propose to bring it within very narrow limits. It seems to us that what is to be determined is simply how can the time which is spent as a pupil under an architect be best utilised. The education of an architect is, or should be, always in progress, and it is absurd to suppose that any period can be fixed when he has no more to learn. It is no less absurd to imagine that anyone can in three years from the time he has left school become an artist as regards design, and an engineer as regards construction. However acute may be a young man's intellect, there is a good deal about building which he cannot comprehend in so limited a period. The vagueness and confusion which are often supposed to represent neglect on the part of a master are a consequence of the extent of what has to be known, as compared with human powers. If some of our young friends are discontented when they find that they have still so much to acquire, they should not conclude that they have been cheated of time and money.

It must be allowed that there would be less disappointment if there was a clearer understanding as to what pupilage means. Parents and guardians appear to think that an architect's office is a sort of machine in which a raw youth enters, and in three years is turned out a finished architect. How far the process resembles school teaching is not considered. But it is unfair to master and pupil to suppose that there can be formal instruction during that term. What an office does is to initiate a pupil in the routine of business, which is something that he cannot purchase elsewhere. If he be incompetent to take advantage of his opportunities, the responsibility cannot well rest with the head of the office; and, on the other hand, the time which is spent in the office or on works does not dispense with the expenditure of very many hours over books and drawings, in lecture-rooms and museums. One part of the pupil's life should be complementary to the other, and the day's work in the office should be brought into relation with the quiet study of the preceding evening.

Too many become pupils without much consideration of their aptitude for the study of architecture. In the majority of cases school training is carried out with little or no regard to the future occupations of the students, and in the opinion of earnest and zealous teachers it cannot be otherwise. Youths are accordingly brought to architects' offices who hardly know more than the rudiments of science and mathematics, and who are unskilled in drawing. It is not surprising that before three years are expired, so many pupils begin to learn that the choice of a profession for them was not wisely inspired. In such cases, it would perhaps be better, as was proposed by Mr. MILLARD, that there should be annual arrangements, although with others it would lead to frequent inconvenience.

What appears to be required is a sort of intermediate school, conducted entirely by architects, in which intending pupils could test their fitness for the profession, and acquire the knowledge and dexterity which would enable them to utilise a three years' term in the most beneficial manner. The course of study should approach as near as possible to practice, although it should comprise a good deal of theory. In a school of the kind, the students need not be afraid to show their ignorance or to ask many questions, as often happens in offices, and it would be the duty of the teachers to devote themselves to the classes. At a time like the present, the experiment could well be made. There are many men in London who are qualified to undertake the work. We believe that it would pay well, and as it would relieve architects from trouble, it could hardly fail to obtain the support of the profession. If the school only served to keep young men out of architecture who are better adapted to work of another kind it would render a service to the public in general.

The existing system is not, however, likely to be immediately superseded, and the question is, How can it be rendered more efficacious? There is agreement that the office as a means of instruction must be supplemented in some form or other. As regards drawing, the ordinary art schools can be made to serve very well. They are so cheap that at one time an architect's pupil was almost ashamed to admit that he attended a Science and Art school of an evening. Indeed, the debt to the schools is not sufficiently acknowledged by artists. A more generous spirit begins to prevail, and unless better and cheaper instruction is available, every architect's pupil should attend the evening classes regularly. In architectural drawing as in other things, the first steps are the hardest, and it is not to be expected that a manager or a clerk can devote time to expounding all the mysteries that to the eyes of a novice are found in the majority of working drawings. It is preferable to sit beside a workman in a school (although men of that class are rare in the classes) than remain disqualified for anything better than tracing plans and copying specifications. Information is often required which is not to be had in art schools or elsewhere without difficulty. Would it not be an advantage if, in such a case, a pupil could obtain the information by payment? A student of an University can always find somebody a little older than himself, who is ready to act the part of a tutor for a longer or shorter term. In London men are to be found of high standing who will give an hour's lesson in mathematics, science, or language, in their specialty in fact, for a moderate

sum. Lawyers can find "grinders," so can medical students, and students preparing for promotion in the army. But while there are architects who are well fitted to give instruction to students, custom will not recognise any other way than by following the practice of pupilage. An idea of this kind must have been before the mind of Professor ROGER SMITH, when he spoke of the creation of a Student's Friend. It could not be expected that any man would have sufficient philanthropy for so onerous an office. What is requisite is, technical advice on occasions when a young fellow is in a difficulty about a drawing, or is puzzled over strains or details of style, or desires to have a series of lessons that will exactly meet his deficiencies. It will be said that information of the kind is to be picked up in the office. But everyone who has had experience knows that there are pupils who fear the "chaffing" that follows an avowal of ignorance, and thus, from a lack of moral courage, pupils become sufferers. It is this faith in the advantages of the "picking-up" system that has left so many men but half-finished architects.

One of the defects of the arrangements which are in force was touched upon when it was suggested that the carrying out of a lodge or other small work should be entrusted to a pupil. There is more than the acquirement of experience involved in the suggestion. To many pupils confinement in an office and bending from day to day over a drawing-board is punishment; there are others who take pleasure in the work. The energy of the former class often leads to successful practice, while students who are careful and useful in the office often end by remaining draughtsmen; and cases could be mentioned where the student became the assistant of the less useful fellow-pupil. In fact it is said that exceptional ability in any kind of office work is not to be desired by a pupil, for he is likely to be confined to that alone, and thus become an unpaid assistant. Besides, it often occurs that men who can do one thing well are supposed in time to be incompetent to do anything else. There are pupils who are out of their element in an office, yet they might become the men who are fitted not only to superintend works, but to resist claims on account of extra works. If they are kept for three years in a back office they have no chance of exhibiting their powers.

This leads us to another consideration. It is becoming more doubtful every day whether it is possible for any one brain to perform all the work that belongs to architectural practice. Art, science, construction, law are combined in the knowledge which an architect is expected to possess, and the encyclopaedical CRICHTON is only a Kindergarten pupil beside him. Nature will, however, have her own way, and she will not always let the artist who makes the picturesque design take delight in the laying of the drains, and the man who is "up" in ventilators, and can spend an hour watching a mason generally finds the "cooking" of a perspective rather difficult. Great as is Sir EDMUND BECKETT in law, lockmaking, astronomy, and building, he fails when he has to design a window. The great defect of English pupilage is that it does not recognise any difference in the capabilities of pupils. They are all supposed to be alike convertible into experts by means of an office. The routine which is followed out of doors is rarely known except by hearsay. The pupils, having no practical knowledge when they first appear, are kept away from every opportunity of acquiring it, and then they discover that they are not entrusted with work because they are without experience. One class of pupils who are at home in offices may be indifferent to so partial a training, but the second class will suffer. If any reform can be accomplished, it certainly should tend to the enlargement of the pupil's sphere of activity. Give him a chance of realising what is meant by out-of-doors work, and in many cases it will be found that the office work will have gained more interest and will be better executed.

We must confess that we have no faith in any specific which will make men architects in spite of themselves. Education is determined partly by native ability and partly by the amount of exertion any individual cares to make. In London it is possible to gain knowledge relating to architecture in classes like those of the Association; but even there there is a necessity for that private tuition or grinding which has done much in other professions. If partnership could be anticipated, and if one student devoted

himself to the scientific side of the profession and his friend took up the artistic, self-education and mutual improvement might be rendered easier; but as matters stand, what seems most to be desired is a near approach to the old-fashioned manner of individual oral instruction, while it should not supplant the three years' pupilage.

## DRY ROT.

BY GEORGE MURRAY.

(Concluded from page 5.)

LET us suppose we have such a spore or seed lying in such a situation, and let us watch it with a microscope and see what takes place. The image of one of these spores must be magnified at least 700 diameters in order to be at all conveniently visible. Even then it represents a very minute speck indeed. Slowly and imperceptibly a small protuberance is pushed out from one end of the egg shaped body, and this proceeds further and further, its progress being measured by hours, till we have a long, hollow tube produced, not quite as thick as the spore from which it started. This process goes on, and by-and-by a side branch is thrown out precisely like the first protuberance, then another and another, till we have quite an entanglement of tubes. If one watches this on a glass microscope-slide the matter ends soon after it has begun, so that temperature and moisture are not everything. If you grow a potato in a dark, damp cellar it will go on rapidly for a while, but will eventually perish when the original potato is exhausted and there is no soil to furnish material for further growth. So it is here. Let the same thing happen on a wooden surface prepared for it, and the tubes will penetrate the substance of the wood and derive fresh nourishment from it, when that stored in the original spore is used up. It will treat the wood precisely as the roots of the potato plant treat the soil.

Let us turn aside for a moment from the examination to inquire into this wonderful process. This exceedingly minute body, when stimulated by certain circumstances of temperature and moisture, proceeds to give rise to another individual such as that from which it arose. To our eyes it presents first a delicate outer membrane enclosing the whole—as the shell of an egg encloses its contents. This membrane, which possesses many remarkable properties, consists of a substance called *cellulose*, well-known in the arts, and to be got in an almost pure state in the form of ordinary cotton-wool. Enclosed by such a membrane we find certain contents consisting principally of *protoplasm*, minute particles of oil and so forth. It is with the protoplasm we have to deal chiefly. It is the seat of the manifestations of life, and is without doubt the most wonderful and mysterious substance brought to light in the whole range of scientific investigation to be found in all living beings, from man down to the lowest organism revealed to us by the microscope—in animals and plants alike. In it the mysterious property we call life exclusively resides. It is indeed as much the chief agent in this new growth of the fungus spore as it is in the moving and breathing life of our own bodies.

Such a substance almost defies description. A chemist would describe it as consisting of a combination of albuminous substances with water and small quantities of incombustible matter; but he would try in vain to reproduce these combinations. It commonly appears as a soft, plastic, tough, and inelastic mass, as in the present case; sometimes it is more gelatinous, and at others even stiff and brittle. All these conditions depend upon the quantity of water mixed with it. Still, one could not accurately call it a fluid at any time; in short, there is no other substance whatever with which it can be properly compared. So much, indeed, if no more, do we have in common with this minute and degraded organism. Undoubtedly its protoplasm is different from ours, but nevertheless it resembles it much more than it differs from it, and the general uniformity of character possessed by this substance throughout living nature is the most impressive fact in all natural history.

When the tube is protruded from the spore its membrane is merely an extension of, or rather addition to, the original membrane of the spore, and the contents of the tube are

likewise an extension of the original contents, reinforced by the water obtained from the surrounding moisture. It is to the activity of the protoplasm that the secretion of the new membrane is due. No growth can take place in any plant or any part of it unless in the presence of moisture—indeed, to such an extent that the membranes must be quite turgid with it—a fact that quite disposes of the idea that the dry-rot fungus can make any progress in dry timber.

The whole body of the mature dry-rot fungus consists merely of more or less dense aggregations of such tubes interwoven in vast numbers and in various states of activity. To some are assigned the functions of penetrating and breaking down the structure of the wood, and of gathering from it what is needful for the maintenance of the life of the fungus. Others transport the nourishment to more remote parts, while yet others are adapted to the production of more spores. These egg shaped bodies bud off from the ends of delicate tubes, which project very slightly from the surface of the general mass. Such, then, is the structure of the fungus which is called particularly the dry rot fungus—*Merulius lachrymans*. There are a number of others, allied to it, often enough found doing damage after the same fashion, and differing from it in appearance. It varies considerably itself in superficial appearance—in colour and shape; but under all its variations the structural and functional description just given will fit it and these allied forms as well. They are to be found growing on dead and decaying forest trees, as well as on the timbers in buildings; indeed, their native habitats are undoubtedly on such trees, where they grew long before man became a building animal. Indications are abundant enough that their ravages were observed and guarded against in the earliest times of architectural history. The antiseptic knowledge possessed by ancient Egyptians and Greeks, as displayed in the preservation of mummies and in the means taken for the maintenance of wooden statues and the like, was not only considerable but highly effective. The records of this knowledge are well known and full of the very highest interest, but it is to be regretted that we have not more left to us of such theories of the causes and operations of putrefaction as must have been put forward by the observing and speculative genius of the Greeks. The circumstances attending putrefaction in general, and making towards its acceleration or its interruption, must have been well observed and considered before the processes of embalming bodies and of imbuing wooden statues with oil were elaborated, and most likely the just conclusion had been reached that dry rot, let us say, in a wooden leg, possessed no small affinity in character with the causes of the decay of its living precursor. It is a question of the greatest interest and moment to readers of this journal how far and in what ways this knowledge of putrefaction in timber has influenced the development of architecture. It has been suggested that stone bases instead of wooden ones were made the supports of wooden columns to preserve them from contact with the humid earth, and capitals to protect the top from rain. Flutings would undoubtedly only offer a larger surface to moisture; but may they not have had their origin in the idea of channels to carry off water? There must be many other arrangements which would occur to an architect as worthy of investigation in this connection. It is manifest that the Greeks did not trust to the Cloud-compeller sparing his own temples.

Very little advance was made upon this knowledge, and no improvement in the methods of preservation, until about the middle of last century, when there began an era of inquiry into the causes and operation of putrefaction and of experiment to discover a satisfactory method of preserving timber. The matter was rendered urgent by the premature decay of the ships of our navy at a time of long-maintained conflict. Nothing thoroughly effective, however, was discovered for long, and it was not until the demand was rendered yet more imperative by the necessity for the preservation of railway sleepers, telegraph poles, &c.—objects placed where putrefaction most readily reaches them—that success was ultimately attained. Corrosive sublimate (bichloride of mercury) used in the process of kyanising, sulphate and other salts of copper (margarysing), chloride of zinc (burnettising), have each had their day, and in this country their use has almost been abandoned for

constructive work, and probably altogether for sleepers and telegraph poles. They have been driven from the field by the competition of the process called creosoting, introduced by Mr. JOHN BETHELL in 1838, which, when efficiently performed, may be trusted to hold its own against all manner of putrefactions. For a history of these processes, and a lucid description of creosoting, those interested should refer to an admirable paper by Mr. BOULTON, on the antiseptic treatment of timber, in the Proceedings of the Institution of Civil Engineers (vol. lxxviii., part iv., 1884).

In all cases where it can be used without interference with design, creosoting may be trusted to keep out putrefaction in timber, and its employment is the architect's best safeguard wherever danger may be anticipated. However, in domestic buildings the selection of timber obviously does not call for the same testing and discrimination as in engineering, and doubtless frequently it happens that the dimensions of the wood have a good deal more to do with its choice for a particular purpose than other considerations. It thus comes to pass that a piece of wood impregnated with the spawn of dry rot is introduced into a dwelling, and from it as from a source of infection the mischief spreads. Prevention having failed, one must look for a cure. There is something to be said against most cures in use, but perhaps least against petroleum, which is rapid and effective in its action, but obviously calls for very wary employment. By this means incipient dry rot may be checked, but the conditions favourable to its growth—such as dampness, &c.—ought to be removed at the same time. When, however, matters have gone too far for the administration of such remedies as are "for local application only," there is manifestly nothing to be done but reform it altogether.

Without doubt in most cases those parts of fungi which possess the greatest power of resistance to external influences are the spores or reproductive bodies, and in considering methods of extermination, it will be best and safest to reckon with them. The spores of most fungi are capable of germination immediately on attaining ripeness, but others require a period of rest the length of which varies with different species. However, a time favourable for germination comes sooner or later, and the power to germinate gradually deteriorates after this period is past. Some retain this power for years, but on the other hand, most kinds lose it in a few weeks' time. Excluding the influence upon them of poisonous substances, it has been proved that numbers of different spores will survive severe mechanical ill-treatment, and after repairing the injuries proceed to germinate. While those growing in the atmosphere resist the effects of considerable dessication, such as live below water perish after drying at an ordinary temperature. Such "resting" spores as tide over the winter for many fungi in our climate will bear subjection to  $-15^{\circ}$  up to  $-25^{\circ}$  C. without the least injury. It may be mentioned, to show to what extremes the power of a fungus to resist cold may reach, that SCHUMACHER, after subjecting yeast cells to  $-113.75^{\circ}$  C. found them in part alive and capable of growth. Resting-spores possess great power of resistance to high temperatures, and many short-lived spores bear considerable heating. There is a marked difference in the maintenance of life between those placed in water or vapour and such as are kept dry. Dry spores of many fungi will bear heating to over  $100^{\circ}$  C., and about  $130^{\circ}$  C. seems necessary to insure the destruction of the hardiest. In water or vapour, on the other hand, the death point is very much lower, and none have been proved to survive  $100^{\circ}$  C. Certain observers place these figures lower, but it will be best to reckon with the extremes, since there is great variety not only among different kinds but even among individuals of the same species.

The conditions specially affecting the process of germination are likewise of the greatest interest. These conditions resemble, in essential points, those of the seeds of the higher plants, viz., the presence of water, which is necessary to all growth; the supply of oxygen, and in special cases of nourishment, which at all events is needed later on; and a certain temperature of the environment of the spores. Very little has been done in the way of ascertaining the cardinal points of the temperature of germination of fungi—that is, it has been determined in but a few cases. These have been observed, however, in the case of

the common "blue mould" (*Penicillium glaucum*) among others. The minimum at which its spores will germinate is  $1.5-2^{\circ}\text{C.}$ , the maximum  $40-43^{\circ}\text{C.}$ , and the optimum about  $22^{\circ}\text{C.}$  (at which they germinate most readily). No doubt these figures vary considerably within certain limits, according to the different kinds of fungi, but one may fairly consider them as illustrative.

The object of these figures, &c., is to show how little we can use processes of heating, freezing, and dessication in effecting the destruction of fungi in such situations as dry rot, and how necessary is poisoning by means of petroleum or other substance. They may also afford information as to the conditions under which preservation of woodwork may be hoped for, where absolute prevention in the form of creosoting is not available.

### "THE HISTORY OF ART."\*

IT is a hazardous undertaking for an artist to represent the history of art by means of painting in a city which contains PAUL DELAROCHE's "Hemicycle." This is what M. EHLMANN has attempted, and, as our readers have an opportunity of judging of both works by means of illustrations, they will be able to give each artist his meed of praise. The two paintings are executed on curved surfaces, and the designs have been adapted to suit the peculiarity of the position.

DELAROCHE's work is in the theatre of the Ecole des Beaux-Arts, and his idea was to suggest to the students that the great artists were observing them. But as it would give stiffness to the composition if all the figures were staring at the spectators from the canvas, some are represented as engaged in discussion. It may be assumed that the subjects are the quality of the students' works and the prospects of French art. While they were in this lower world so many artists could hardly be brought together without risk of bloodletting; but Elysium has softened their manners, and the whole composition is marked by its repose and absence of action. Hardly a finger is raised to give emphasis to an opinion.

In M. EHLMANN's work there is movement throughout, and as it is suggestive of the various transformations which art has undergone, the repose of DELAROCHE's work would be out of place. In one we have beings whose work is over, and who look as if they should like once more to handle palettes and chisels. In the other we have forces in action, for what is history but a discovery and relation of all that has been done by force? M. EHLMANN depicts the dynamics of art, and DELAROCHE the statics. One tells us of the struggle to overcome difficulties, the other proclaims the victors.

A puzzle in all art history is to know where to begin. Greece, Assyria, Egypt, derived their art from something older, and it is in vain that we seek the common origin. Here, again, M. EHLMANN recognises the facts. His picture is painted around the walls of a staircase cupola, and thus when we arrive at POUSSIN, RUBENS, and HOLBEIN, we see them succeeded by the representatives of Eastern art, who do not appear out of place when found in contiguity to the ancient Egyptians, and so on through Greece, Rome, Byzantium, and Florence. We may apply to the picture RICHTER's remark on HERDER, and say that in it "Greek life-freshness and Hindoo life-weariness are wonderfully blended."

In the first part, which is published this week, we begin with Greece. By introducing the primitive actors as Tragedy and Comedy we are led to imagine how much art owed to the drama. The desire to appear and to win applause was not confined to the simple Thespians or the actors in the festivals of Dionysus. Then came the games in which the human figure was exhibited in all its perfection, and with such models before them the Greek artists could hardly fail to produce works which are still unsurpassed. According to the old Greek poem, the first wish ought to be for health, and the second for beauty, and those qualities characterise the sculpture. The four dancers which M. EHLMANN introduces suggest the grace and vigour of the Greek form; the skill by which action was

restrained and even the fury of Bacchantes and Cretans was subjected to rhythmic laws. Then comes PINDAR, who is fitly placed there as the exponent of a similar power in poetry; for he also believed that it was possible to have too much of even the most sublime enthusiasm. Besides, he was the author of many song-dances, in which music and motion were combined, and in one fragment he appeals to the gods to send Art to regulate the festival:—

Come hither to the dance,  
Olympian gods, and send us glorious Grace,  
Ye who frequent  
The city's crowded centre, where the scent  
Of incense hangs about the holy walls  
Of Athens, and her famous market-place  
Gorgeous with ornament.  
Accept our outpoured offering  
Of wreaths of violets fresh plucked in spring.

The archaic statue of *Minerva* is suggestive of another factor in Greek art—a sort of conservatism or obedience to types which were consecrated by age and tradition. Figures of *Architecture*, *Sculpture*, and *Painting*, who have come to do homage to the goddess, are succeeded by the artists of the Parthenon. The figures which stand for Greek art are fourteen in number—that is, seven on either side of *Athene*; but there is no formal correspondence, although the relation of the groups is sufficiently expressed.

The arts of Athens could not protect Greece against the thews and sinews and discipline of the Roman soldiers. But the invaders were not unfriendly to art, and M. EHLMANN puts a chapter of history when he represents the soldiers carrying off the sculptor as well as his incomplete statue. There is much pathos in the figure of the sculptor who appeals in vain to the goddess for protection.

The figure of a woman at the feet of the impersonation of *Power* tells us that in Rome art became subjected to the conqueror. Religion and law obtained more supremacy, and even poetry assumed an official character. The Roman group in its stolidity and unity forms a contrast with the more free life of Greece, and we have no longer the artist offering his work to the gods. M. EHLMANN has also reflected on that amazing phenomenon in universal history which is called the overthrow of Roman power. It seems a mystery how so splendid an organisation could collapse, and in a few figures M. EHLMANN has expressed the substance of volumes. On this subject a paragraph may be quoted from an essay by Cardinal NEWMAN:—

Who can estimate the strength of a political establishment which has been the slow birth of time? And what establishment has ever equalled pagan Rome? Hence has come the proverb, "Rome was not built in a day." It was the portentous solidity of its power that forced the gazer back upon a reflection, which was the relief of his astonishment, as being the solution of the prodigy. And when at length it was built, Rome, so long in building, was "Eternal Rome." It had been done once for all; its being was inconceivable beforehand, and its not being was inconceivable afterwards. It had been a miracle that was brought to be; it would take a second miracle that it should cease to be. To remove it from its place was to cast a mountain into the sea. Look at the Palatine Hill, penetrated, traversed, cased with brickwork, till it appears a work of man, not of nature; run your eye along the cliffs from Ostia to Terracina, covered with the debris of masonry; gaze around the bay of Baïæ, whose rocks have been made to serve as the foundations and walls of palaces—and in those mere remains, lasting to this day, you will have a type of the moral and political strength of the establishments of Rome. Think of the aqueducts making for the Imperial city for miles across the plain; think of the straight roads stretching off again from that one centre to the ends of the earth; consider the vast territory round about it strewn to this day with countless ruins; follow in your mind its suburbs, extending along its roads for as much, at least in some directions, as forty miles; and number up its continuous mass of population, amounting, as grave authors say, to almost six millions—and answer the question, How was Rome ever to be got rid of? Why was it not to progress? Why was it not in progress for ever? Where was the ancient civilisation to end?

The people who witnessed the invasions of Northern and Eastern barbarians believed that an end had come to the world. It was not only that whole districts were depopulated, but civilisation itself appeared to have been destroyed for ever. The painter in SHAKESPEARE'S "Timon of Athens" tells the poet that he is able to make

\* See Illustration.

paintings that will demonstrate a moral more frequently than can be done by means of words; and it would be difficult to imagine a more effective incident than that which has been introduced by M. EHRMANN. Unlike the Roman warrior who preserved the statue, the barbarian is seen using a figure, which he has torn from a church, as a weapon against one of the auxiliaries who defended what was left of the Empire, and the degenerate descendant of "the she-wolf's litter" can make no use of his hands except to wring them. For all we know to the contrary the artist may have wished to point a moral, and suggest that the pillage of Greece by Rome had been avenged, and that NEMESIS had made use of art as a means to an end.

If the history of art were related in the form of a drama the curtain ought to fall at the end of this act, and an interval of many centuries should be supposed to elapse before it rose again. But painting does not allow of gaps; so the monk who was the means of preserving some relics and traditions of art out of the general conflagration comes close to the Goth. Then we have NICOLÒ PISANO, CIMABUE, GIOTTO and the early Florentine artists, and with their names we may conclude for the present.

(To be continued.)

### THE NESTOR OF FRENCH PAINTERS.

IN the last Salon there was a portrait of a lady, numbered 1,039, and described as the work of M. Jean Gigoux. Any one who studied it would hardly believe that it had been painted by an artist who obtained a first-class medal as far back as the year 1835. M. Gigoux resides in Paris, and his studio in the Rue de Chateaubriand, near the Arc de Triomphe, is the resort of the celebrities of the capital, who are proud to do homage every week to a painter who has been the friend of nearly all the great writers and artists that flourished in France during the century, and whose own merits entitle him to honour.

"Le Chevalier du Guet" has described an "At Home" in the *atelier-salon* of M. Gigoux. On entering the house, he says the visitor is sure to find, from the sound of the voices, that a great many friends have come before him. As he ascends the staircase he will recognise some of them; and one may be heard saying, like M. Edmond About, "It would be impossible to make a false step here without running the risk of tearing a canvas worth fifty thousand francs." On the threshold you are met by a man of middle height—a Gaul in type, with long grey moustaches and an abundance of white hair. He wears a small hat of grey felt, and stretches out both hands to grasp yours. This is M. Jean Gigoux, the *doyen* of the Burgundian artists in Paris, the man to whom the enviable privilege is vouchsafed of being able to conserve the affections of youth, as well as its charm, enthusiasm, and innocent gaiety. You are introduced to the visitors who are present, and very quickly find yourself at ease among them.

The studio has the appearance of a room in a club, and everyone is talking. Art, the theatre, the last romance are freely discussed; about politics alone little is said. In one place we hear M. Pasteur analysing and praising some unfinished painting which is on the easel. He is interrupted, it may be, by M. Bonnat, the portrait painter, who desires to have the latest experience about the *savant's* experiments on canine madness. MM. Henner and Hector le Roux, the painters, are also eager for information. But M. Oudet and M. Marquet, the sculptors, propose a game of dominoes, and science is at once forsaken. Elsewhere in the studio we see a group of notabilities in politics. Here also are architects, and among them is M. Edouard Renaud, who long ago constructed the very first *atelier* that was owned by M. Gigoux. In the recess of the vast window that opens on the street one may find M. François, the landscape painter, who is the oldest pupil and the faithful friend of the host. He is relating to the young painters, MM. Rapin and Pointelin, some trait of Corot, who was also his master, and whose memory he reveres. The sculptors have their own corner, and MM. Chapu, Guillaume, and Gauthier are probably occupied in it with the last competition, or a scheme for the reform of the Salon. Every question relating to art comes up for discussion in this *atelier*. There reputations are determined; there subscriptions or auctions for a poor artist are organised; there wit sparkles without wounding; there one learns what has been done during the week, or what is in preparation. And for three-quarters of a century or so these meetings have been held.

But what a treasury of anecdotes will be the recollections of M. Gigoux whenever they appear. From Madame Vigée-Lebrun to Courbet, from Baron Gérard and David d'Angers to M. Meissonier, he has known all the artists, has assisted in all the transformations of the French school, has shared in all the

progressive movements, and borne a part in every one of those glorious struggles which have brought about the emancipation of art. Mention an illustrious name, and he will recall some story that is pathetic or comic. One anecdote leads to another, becoming like links in a golden chain which encloses the past.

Among the most interesting of the recollections are those relating to the rivalries of modern masters, which in their bitterness resembled the feuds of the men of the sixteenth century. Two instances may be cited. David d'Angers and Pradier, the sculptors, detested one another from their hearts. Diaz, the painter, abhorred Ingres. M. Gigoux witnessed many of their encounters. David d'Angers, in going to the Institute on Saturdays, was accustomed to call on M. Gigoux. The studio of Pradier was on the ground-floor of the house, and he was able to watch the coming of his enemy. One day, on seeing David coming up the steps, he planted himself near the door, and pretended to be busy in retouching one of his statuettes. By putting his back against the wall and extending his legs, he made entrance difficult, and it was with a strain that David was able to force his way in. But he soon took his vengeance. He looked steadily at Pradier, and with a sudden blow of the fist he bonnetted him. Then he passed on proudly.

The hate of Diaz for Ingres was exhibited in a different way. Diaz used to say that if he ever had the misfortune to come across a picture of Ingres in the morning he was unable to work for the rest of the day. Once, at table, somebody imprudently mentioned Ingres's name before Diaz, and forthwith he became furious. He struck the floor with his wooden leg, and cried out that Ingres was worthless, and as much out of place as a Chinese among the ruins of Athens. M. Gigoux has in his dining-room a portrait of a picture-dealer which Ingres had painted in his best style, and presented to the man. But the dealer was compelled, by necessity, to part with it, and it came into the possession of M. Gigoux. When Ingres heard of the incident he said, "What an unfortunate fellow—he has sold himself."

It is easy to pass from Ingres to Eugene Delacroix. Troyon, the cattle painter, was most eager to possess a picture by the renowned colourist, and seeing one in a window he gave sixteen hundred francs for it. When Delacroix was informed of the purchase he was greatly moved, and ran to Troyon's studio in order to express his recognition of the kindness. While speaking he took up a palette and brushes, and then and there painted a superb figure of a lion, which he presented to Troyon. The excessive nervousness of Delacroix was well known. Once, when looking at a splendid lithograph, which M. François had executed after the *Barque de Don Juan*, he seemed to be afflicted on again seeing his picture. Pointing to one of the figures he said it should represent a man who died of famine while on the ocean, and yet, said Delacroix, "I have represented him in good condition. How could I have done so stupid an act?" M. François asked if he intended to retouch it. "Retouch it!" said Delacroix, "there would be too much to do. I was feverish when painting it. What would you wish? Do as you like. Has Audran copied Lebrun literally? No, he has planed him. Well, you plane me smoothly." M. François, however, took care about the planing.

Among other works, M. Gigoux designed the illustrations for a fine edition of the "Gil Blas" of Lesage. At first the publishers wished to obtain a hundred sketches. The artist, being engaged during the day on his large picture of *Leonardo da Vinci*, could only devote his evenings to the task, and he said he was afraid that he could not find enough subjects in the book. Eight days afterwards there was a request to him to make the number four hundred. On reading "Gil Blas" with attention, he discovered that on every page there was a suitable subject. Accordingly, when he was asked to give six hundred vignettes, he replied that he could do a thousand, or as many as was desired. In the course of eight months the three publishers divided between themselves 150,000 frs. out of the edition, but the artist who was the means of attracting so much profit had no share in it.

In 1833 or 1834, M. Gigoux met a handsome young man, called Chevalier, in the *salon* of the Duchess d'Abrantes. He became better known as an illustrator of books, under his pseudonym of Gavarni. At the time he was noted for his dandyism. M. Gigoux speaks of him with unlimited admiration. As one approaches the present time, the souvenirs of the artist become more numerous and striking. Take, for instance, the story of the interruption of a *soirée* of Lamartine's by an absurdity of Jean Journet, the reformer—a man who has been represented by Courbet with a wallet on his back and a pilgrim's staff in his hand. On the occasion referred to, Monsieur and Madame de Lamartine held a reception, but in reality they received nobody. As the hour advanced Madame de Lamartine, becoming surprised, turned to the *salon*, which she saw was full. There in the midst, mounted on a chair, was Jean Journet expounding the principle of Fourier's Phalanstery, or dwellings in common, to the assembly. For once in his life

he had found an auditory, and had resolved that it should not escape. The guests were accordingly detained, in spite of themselves, until the end of the oration, and even M. de Lamartine could not help joining in the hilarity. But the incident had one advantage, as it was a departure from the commonplace character of fashionable assemblies.

What is it that M. Gigoux has not seen or heard? He has observed the two young dramatists, Victor Escousse and Auguste Labras, pass under his window carrying the charcoal by the aid of which they committed suicide on the failure of their melodrama in 1832. He has heard Louis XVIII. attempt to be witty when giving the gold medal to Géricault, and heard Madame Vigée-Lebrun, the portrait-painter, talk of Marie Antoinette. He has been the confidant of Alfred de Vigny, and has discussed science with Humboldt, and æsthetics with Charles Blanc. He has seen the great Millet compelled to exchange one of his pictures for a new canvas. He has been the friend of Béranger, Thoré, Théophile Gautier, Barye, Joffroy, Daumier, Corot, Marilhat, Theodore Rousseau, and of many other illustrious men. It is the intention of M. Gigoux to leave his series of drawings by modern masters to the museum of Besançon, which is his native place; and the most lucid commentary on them will be his own recollections of the authors.

### MANCHESTER SCHOOL OF ART.

THE annual distribution of prizes to the students of the Manchester School of Art took place on Tuesday evening in the Town Hall, Albert Square. The Mayor presided, and the prizes were distributed by Mr. Val Prinsep, A.R.A.

Mr. Val Prinsep, in addressing the students, began by speaking of the sadness of the colours in Manchester. It had not only struck him, but every other artist who had come north. No doubt males were devoted to black cloth. In France they would find that a fond mother dedicated her child to the Virgin Mary in white raiment. Males, both in Manchester and elsewhere, had their time very much occupied, and had but little leisure to devote to the choice of their clothing. Perhaps it was well it was so; but it did seem strange to him, as an artist and one from the south, to see the self-denial exercised by the fairer sex, who had so much latitude given to them, in dress at least. Surely amongst the working classes one could see something better than dirty drabs and blacks. Surely some of the large employers of labour might furnish them with some of the cheap articles which were so pretty, and of which he had no doubt a great many were made in Manchester. A Manchester lass would surely not refuse to wear what she had contributed to make, as the cook and the confectioner used to refuse to touch the dishes they had evolved. To bring colour, by whatever means, into the dwellings of the poor would do good, if it only showed the general barrenness which surrounded them.

He feared he would be treading on delicate ground, but he should like to say a few words about the buildings in this city. There had been many magnificent palaces raised at the public cost, and many by private enterprise, in Manchester. The building in which they were was a very magnificent specimen of a bygone art, and inasmuch as it supplied admirably, he was told, the necessities for which it was built, the architect deserved the greatest possible praise. But, candidly speaking, he did not think that Gothic architecture was adapted to Manchester. They had made their experiment, and it had turned out as well as Gothic architecture could turn out, but when Gothic architecture was at its prime the tower and pinnacle and spire rose clear against the sky as God made it. The stone was its own beautiful colour, or as the ages went by time gave it the colour, which artists so much envied, of a still more beautiful grey. The many angles and vast quantities of details of Gothic architecture were never intended for a smoke-grimed atmosphere, and when covered with carbon they looked heavy and dreary in the extreme. He had noticed since he was in Manchester last that even the Town Hall looked blacker. If the artist who invented the flying buttress, or the beautiful traceried window, were alive nowadays, did they think he would be content to expose his work to the Manchester atmosphere? He was delighted to see that the Corporation had begun to decorate their halls. He would have liked, for the sake of his friend Madox-Brown, and for the sake of Manchester, the decorations to have been larger, but they were a good beginning, and he hoped that the Corporation would see the justice of extending them till there was no blank wall and no public building in Manchester which had not its artistic interest; an interest not only for them that were there that day, but for their children after them, so that they might be brought up with a knowledge of what was beautiful and what was good. These things no doubt appeared as trifles to them, and trifles no doubt they were when compared with the mighty questions which came before the chairman and his colleagues. But he

would have them remember the noble lines which Samuel Johnson was wont to thunder forth—

Think nought a trifle, tho' it small appear :  
Small sands the mountain, moments make the year,  
And trifles life.

They had no doubt seen in Manchester, at least on the stage, a caricature of those curious beings who went by the name of "æsthetics." Very ridiculous they were, with their long dresses of sage green, and, above all, their odd, sentimental jargon of talk. But in æstheticism itself there was a great and noble truth. These "æsthetics" seemed to him a kind of "Salvation Army" of the arts, upholding a noble cause, but covering it with tomfooleries. Æstheticism was the science of the beautiful, the science of the arts, and as such the language was taught in that school. He would like everybody in Manchester to consider well all subjects that had to do with beauty, for it was not only themselves that they hurt by any want of taste, both publicly and privately, but their eyes got so used to "the accursed thing" that they failed to see its badness. Painters constantly found, when they were at work on a picture and gazing at it day after day, that they had no idea what the picture was like, and they committed the most glaring faults, which were patent to the eye of the merest tyro in the profession. Any one of those present who committed a fault in form or colour in the decoration of a drawing-room was doing a grievous wrong to the children who were to be brought up amongst such things. He would have them be very careful in all matters of taste. It was infinitely easier to admire and understand the commonplace than to admire and understand what was really good and beautiful. To admire the commonplace required no effort of the mind at all, whereas to see what was really grand in a noble work required both knowledge and observation. Take for example a magnificent sunset. They would say they had seen sunsets like that a thousand times, and he had no doubt they had, and in a thousand pictures. It took no effort on their part to recognise it or, indeed, on the painter's part to reproduce it. A great painter when he reproduced a scene looked at it with his own eyes, and not through any one else's spectacles. He gave them what he felt, and what he alone felt, and if they understood, or cared to understand, what he had done, it affected them in the same way that nature ought to affect them if they cared for nature, for nature was recalled with novelty and charm, and it was full of that grandeur, not on the surface but low down, as were our best feelings, and it was with those feelings that a great artist worked, no matter how he worked, whether in poetry, or music, or colour. If they acquired that language it would open their eyes, and cause them to see many beauties in nature which they had passed by unperceived, and it would make them often, he would venture to say, better men.

They would think, he dared say, that he was a long time in coming to the art school. He had that day been inspecting the art school, and he had read with care its report. All he could say was that one of the things he had envied in Manchester was the building in which the art school was located. If he said a few words to them, they must recollect he could lay down no rules by which they could work, for in an address of that kind it was absurd to do so. He could only try to make some of them students, for if he were to lay down rules there was no one in his own craft, who knew the craft, who could not break through them with impunity. There was once a king of Prussia who wrote very bad Latin grammar, and when the faults were pointed out to him he said, "I am a king, and above grammar." So a great artist made rules as he pleased, for he was a king amongst men. Let no one imagine that he was a genius, for geniuses were very rare. Let them, however, beware lest, like the ass with the lion's skin, their pretensions brought them only into ridicule. If, however, they all worked diligently at the school, if they were acquiring the A B C of the profession, the grammar of the art—and let him tell them that whatever they might think about writing and about expressing their thoughts intelligibly in artistic language it was going a great way—if there were any present who wished to enter the ranks of the profession to which he belonged he would wish them God speed on their journey, and bid them acquire knowledge on all sides, no matter whence, for knowledge was absolutely necessary. He would warn them against that great and besetting sin—especially amongst young artists—the charm of eccentricity. Eccentricity was not genius; it was too often the cloak of ignorance. He would also say to them that the race was not always for the swiftest, and that that man who had the noblest thoughts to express had very often the greatest difficulty in finding words to express them, whereas the fluent gabbler found words enough in which to clothe commonplaces.

There was another class to which he should like to address a few observations—those who followed what were called the applied arts; for in Manchester, and indeed in England, there seemed to be a great opening for such things, all people being keen now to acquire pretty furniture and pretty curtains, and works of art of all kinds not so expensive as pictures. It might

seem to some of them an easy thing to design a pattern; but let anyone sit down to try to invent an original pattern, and he would soon find that it was exceedingly difficult to do so. The great text-book for that art, and indeed for all arts, was nature. In every hedgerow we should find forms enough to aid the designer. Each tree, each flower, was an inimitable work of art in itself, and could be copied and studied. When a student painted a head, he could with great care get all the features correct—he could even get them very like; but the result too often was hurried and inartistic. When the artist set to work to paint the head he recollected what he had to do—how the skin was soft and tender, how the blood coursed beneath the skin, giving an infinite variety to tone and colour. He remembered that the nostrils and mouth were capable of movement and expression, that the eye was liquid and at the same time piercing and full of expression, and he generally found that he had to sacrifice a certain amount of detail to give his impression of that head. And so it was in all works of art. They must put sentiments into them. It was a curious question, which had puzzled a great many, that the least civilised nations very often had a superior power of design. He must warn them that what they were doing in that school was only the beginning of what they would have to do by-and-by. They were learning there the A B C of the art, the means to the end. There was a great future for British art, no doubt, if it could only be attained, for the students that were to come, for at present it hardly existed in a great many things.

## TESSERÆ.

### Designs for Incised Slabs.

WILLIAM BURGESS.

IN designing new subjects we must be careful to the last degree to give them a sharp and energetic outline, even when copying from nature. For unless the subjects are really copied directly from nature, there can be no freshness or originality about them. In designing a group of figures, it will be necessary to have the living model and good stout cloth garments; for a man may copy Mediæval figures for ever and yet be unable to design as they did in the Middle Ages, for doubtless then, as now, really good figures (and there were not a few of them produced in the thirteenth and beginning of the fourteenth centuries) were copied directly from the life. If monsters must be employed, why not follow the advice of Leonardo da Vinci, who recommends us in this case to copy parts of existing animals, and afterwards to join them together? But I think the giraffe, the kangaroo, and the apteryx would be as effective as any Mediæval chimera, to say nothing of the resources we might derive from the antediluvian world. Truth is always stranger than fiction. Again, in designing an incised slab, our great aim should be to make the object cover the ground pretty equally, so as to leave no very large spaces of cement which would be liable to be worn into holes. When this cannot be done a small circle is left, so as to diminish the space and balance the composition. These little circles occur very frequently in the S. Omer slabs. When this space becomes larger, as in the Taurus at Canterbury, they become quatrefoils; and when, as in the equestrian figures, it becomes still more extensive, a stem of foliage supplies their place. Another point to be considered is the termination of the lines of the drapery. They should never, if possible, end in a sharp point, but rather in a blunt point with a nick at the end. The object of this is evident. The workman can get his drill or chisel to the end of the latter, whereas the former must necessarily be shallower towards the end, and consequently soon become obliterated in that part, especially when the stone has become worn down to the depth of an eighth of an inch, as the dalles of S. Omer have. Again, the borders should be composed of a stout, strong network, of two or more scrolls; if a single scroll is used, figures should be introduced to restore the proper balance and give it strength. An additional amount of energy is got by not making the scroll homogeneous with the outer line of the border. A good strong line should be employed to divide them.

### Dignity of Craftsmanship.

QUATREMÈRE DE QUINCY.

Artisans are, generally speaking, too dependent on their employers to act otherwise than as they think most likely to please; and thus, by depressing themselves, they contribute to lower the standard by which they are judged. The case ought to be reversed. If every man contrived to raise himself a little above the usual standard, his profession would rise with him, and would soon be held in a much higher degree of estimation. Every man, in short, when he deserves to be respected, communicates to his profession a degree of consequence which cannot fail in the end to be advantageous to himself. The

artisans of Rome were citizens, and voted in the *comitia*; and the Greeks appear to have made still fewer distinctions than the Romans between the liberal and the mechanical arts, and between artists and artisans. In Greece, every artist who excelled in his calling could look forward to his name being immortalised, as well as that of the most distinguished artist. We have handed down to us the name of Architeles, a famous stone-cutter, who distinguished himself in the art of hewing out columns, and in the Isle of Naxos statues were erected to Bizas, who first formed the Pentelicus marble tiles to cover buildings. The names of several other artisans, of different kinds, have also reached us, and many works and modes of working now practised have taken their names from that of the workman who invented or perfected them.

### Marble Veneering of Walls.

SIR G. G. SCOTT.

The practice of overlaying buildings with thin slabs of marble is open to this objection, that if the slabs are quasi-constructive in their distribution they involve a sham; if not so, they disturb the constructive idea which is so desirable to keep up in dignified architecture. I consider the practice fair and admissible if not pretending to be constructive, but would suggest that it would be much better to limit it to panels and other subordinate parts, the genuine walling material being shown around it. I may mention that at St. Mark's, at Venice, the slabs are placed with their longest dimensions *vertical*, as if to prevent any thought of their pretending to be constructive. In the domestic buildings at Venice, the windows being generally of marble while the walls are of plastered brickwork, the former are made almost like a modern chimney-piece, the whole window construction being cut out from the wall into which it is built by what a modern mason would call an "out-ground" or thin strip of marble (perhaps an inch and a half thick) built edgeway into the wall, and enclosing the ornamental dressings of the window. The edge of this slip of marble is cut into the peculiar Venetian dentil. Coloured marbles are often used within this framing.

### Selection of Granite.

PROFESSOR SULLIVAN.

All granites and porphyries are not equally durable; indeed, some decay with an amazing rapidity. The cause of this decay is not well understood, but it appears to depend as much upon the chemical constitution as upon mechanical aggregation. Some felspars contain potash and others contain soda. Experience and theory show that soda granites decompose more readily than those containing potash. The coarser the texture of granite the less durable it is; hence, when the stone is selected for the erection of public buildings, it should be fine and uniform in texture. It should also be free from small crystals of iron pyrites disseminated through it, or any other ore of iron, as these, on exposure to the weather will rust, and thus destroy or deface the stone. The obscurity in which this question is involved can be judged by the fact that often in the same quarry a portion of the rock, appearing to differ in no respect from the rest, will totally decompose in a few years.

### Roman Mosaics.

B. PISTRUCCI.

The mosaics which are made in these times are composed of pieces of glass, sometimes called smalt and sometimes paste. They are made of all kinds of colours and every different hue, and for large pictures they take the form of small cakes. For small works they are produced in threads, varying in thickness from that of a piece of string to the finest cotton thread. Heaps of these of all tints and colours are prepared. A plate or slab of copper, marble, or slate is then provided, of the size and thickness required for the intended work. This slab is hollowed out so as to resemble the bottom of a box or a tray to a depth proportioned to the work. This may vary from an inch to the eighth or even the sixteenth of an inch, if the work is to be small. This hollow is then filled with plaster-of-Paris, well smoothed, on which the outline of the proposed design is very accurately traced, and an ink pen is passed over the outline to preserve it. Very few tools are required by the workmen, but for the large works, where comparatively large pieces are to be inserted, small sharp-cutting hammers are made use of for splitting the cakes and reducing them to their proper size and form. Pincers also, of different forms, are used for placing them equally. In very small works, instead of hammers, sharp-pointed pincers are made use of, like those with which diamonds are taken up, and sometimes a small tool like a *scarpello* or chisel. The heat of an oil lamp is required to enable the workman to draw out the strips of glass to the fineness he wants, even to that of a hair. When this is all ready, the first operation is to dig or scoop out with a *scarpello* of the proper size a small piece of plaster-of-Paris from the

bottom of the box or tray, without injuring the outline. This is filled up with a kind of mastic, like that which is used to fix panes of glass in the sashes or frames of a window, and the required piece of smalt or glass is then pressed into the mastic or composition. In this way, step by step, and from day to day, repeating the operation of scooping out a small piece of plaster-of-Paris, and never losing sight of the outlines, they gradually fill up the whole tray. In works of considerable dimensions the workmen place the tray or plate before them as painters place the canvas on which they are painting, and have the original always close to them. For smaller works they sit at a table, as if writing, and generally keep their work flat on the table. When this operation is completed, it is passed over a stone made perfectly smooth and cleaned of every kind of dirt. But as it will always happen that interstices, however minute, will be left more or less between the several small pieces of smalt inserted in the mastic, these are to be carefully filled up with heated wax, applied with hot iron instruments from a pallet on which it has been prepared for the purpose; and much of the good effect and finish of the work will depend on the ability and care of the workmen by whom this operation is performed.

#### French Scaffolding.

CAPTAIN FOWKE.

The French method of scaffolding differs in many points from that in use in this country; it is entirely of squared timber, and put together with bolts and nuts, and, instead of ladders, regular stairs are constructed in different parts of the scaffold itself. Ready means of ascent and descent are points of more importance in France, from the fact of the substitution, in a great degree, of manual labour for mechanical in raising material to the work. To such an extent is this carried, that in the construction of a wall 50 feet in height, which was erected at the request of the British Commission, the stones of which it was composed were handed up from man to man by men placed on a ladder and along part of the scaffold, and twenty were constantly so employed.

#### French and Italian Renaissance.

F. MELIZIA.

On comparing the edifices of France and Italy, it appears as if the architects of the two countries had derived their principles from different sources. A variety of climate and habits necessarily produces a difference in architecture; but this ought only to be observable in the materials, in accommodation, and apertures for the introduction of light and air, in the form of the roof, or other matters connected with these points; never to the application of the orders, ornaments, the forms of doors or windows, the proportion of parts to the whole. These latter should be conformable to rule, and the same in every climate, the laws of architecture being immutable. The French dislike monotony of effect, particularly in their large buildings. Blondel could not endure a design that was without projecting masses, or numberless ornaments between the windows, which he considered requisite to produce what in France is termed "movement" and "effect." Palladio has given this to his façades by graceful forms, well-chosen situations, correct profiling of his orders and details, and just proportions. Indeed, a true brilliancy of effect is produced by an arrangement of columns, as we see them in the Pantheon, Antoninus, Faustina, and other Roman temples.

#### Painting on Plaster.

D. R. HAY.

The process of painting plaster-work is as follows:—White lead and linseed oil, with a little litharge to facilitate the drying, are mixed together to about the consistency of thin cream; a coating of this being applied, the oil from it is sucked into the plaster in the course of a few hours, leaving the white lead apparently dry upon the surface. In the course of a day or two, when this coat has sufficiently hardened, another is given a few degrees thicker, the oil from which is partially absorbed according to the nature of the plaster. In the course of a few days more a third coat is applied. This coat is made pretty thick, and, if the absorption of the oil from the second coat has not been great, about one-fourth of spirits of turpentine is added; but where the absorption has been great, a less proportion of spirits of turpentine is employed. Into this coat is put the colouring ingredients, to bring it near the shade intended for the finishing coat. Should the plaster now be thoroughly saturated, the flattening, or finishing coat is applied. Before this is done, however, a fourth coat, thinned with equal portions of oil and spirits of turpentine is generally given, particularly where the work is wished to be of the most durable kind. The flattening or finishing coat is composed entirely of paint, that is, of white lead and the colouring ingredients mixed together and ground in oil to an impalpable paste. This mixture is of a very thick consistency, and must be thinned

with spirits of turpentine until it will flow easily from the brush. The spirits of turpentine being very volatile evaporate entirely, leaving the surface of the paint of a very compact and hard nature. By this process the plaster is rendered incapable of absorption, and the surface of it is hardened by the oil which it has sucked in from the first and second coats, and is thereby rendered less liable to breakage, with the great advantage of being washable.

#### Tests of Wrought Iron.

D. KIRKALDY.

Whenever wrought iron breaks suddenly, a crystalline appearance is the invariable result; when gradually, invariably a fibrous appearance. Whether, on the one hand, it is finely or coarsely crystalline, or, on the other, the fibre be fine and close, or coarse and open, depends upon the quality of the iron. When there is a combination in the same bar or plate of two kinds—the one harder or less ductile than the other—the appearance will be partly crystalline and partly fibrous, the latter produced by the gradual drawing-asunder action previous to and at the time of rupture; whilst in the former the iron breaks suddenly, without elongating at time of rupture. When the proportion of the harder is considerably less than the softer, the former snaps suddenly, whilst the latter continues stretching; but when nearly equal, or the less ductile predominates, both portions break together, or almost at the same moment: the one part, gradually arriving at its limit of endurance, breaks with a fibrous appearance, whilst a greatly increased strain consequently coming on the remaining portion, it suddenly gives way, producing a crystalline appearance. The relative qualities of various irons may be pretty accurately judged of by comparing their fractures.

#### Glass Painting.

F. KIRCHHOFF.

A stipple-shadow is a series of dots, which, if properly managed, should not touch each other. This style of painting is the most transparent, as it allows the local colour of the glass to blend with the shadow. It is used for broad, bold work. The smooth painting requires less colour on the glass than the stippled, as it intercepts the rays of light more effectually. This method is generally adopted in glass where high finish is required, or when the window is close to the eye, as, if skilfully done, the glass-painters' colour will appear like a darker tint of the glass. The third style—the smear—is a sort of compromise between the other two. It is mostly used for Mediæval work. It is so painted that the brush shall leave the mark or grain, as it is technically called, and not softened off as in the smooth manner. When dexterously executed, it gives great richness to the glass. It must be finished off in one bold, decided, yet careful touch, as, if painted over again, it loses the grain which constitutes its merit. Some of the old windows exhibit splendid specimens of this treatment. It is to glass what the sculptor's tool-marks are to stone, or a wood-carver's chisel-marks to wood. It gives a sharpness and vigour to each material. There is also another method of getting shadow on glass by etching it up with lines painted on with a fine brush, which, though it allows of getting a more correct form, combined with transparency, is not very generally adopted.

#### Metallic Oxides in Cements.

"MINUTES" OF INSTITUTION OF CIVIL ENGINEERS.

Hydrate of lime is the basis of all mortars; but this will not make a water mortar or cement without the addition of a metallic oxide. The addition of clay will effect this, but most clays contain a metallic oxide. The analysis of Dutch terras, of basalts, and of puzzolana, according to different experimenters, show a considerable quantity of iron, and an addition of any of these to hydrate of lime will make a water mortar. Thus it appears that we must carefully distinguish between a good mortar and a good water mortar or cement. Hydrate of lime is the basis of both. Good mortar depends for its excellence on the slow absorption of carbonic acid; and the slow absorption of this is, according to Tennant, the essential condition for good mortar. It is remarkable, according to Pliny and Vitruvius, the Romans kept their mortar for three years; and it was the custom among builders to bury mortar or keep it in a cellar. It was thus prevented from absorbing carbonic acid from the atmosphere, or in other words, from being reconverted into limestone. According to the experiments of Tennant, it appears that mortar in three years and a quarter will regain 63 per cent. of carbonic acid of which it has been deprived. The absorption of the carbonic acid being the condition of the mortar hardening, if it is used under circumstances through which the absorption cannot take place, as under water, some other material must be supplied, and the addition of a metallic oxide appears to supply the required element. A singular fact has been noted: that the rust of iron has a peculiar disposition to travel through moist clay; the rate of this transfer was in one instance about an inch per month.

## NOTES AND COMMENTS.

THE reports which have been sent to the Foreign Office by the English ambassadors on the Continent, suggest that the building of houses on sites which are held for limited terms, is one of the peculiar institutions of Great Britain. The division of agricultural land among a large number of small proprietors is a great evil, according to some English economists. McCULLOCH said that "France was converted by means of it into a pauper warren," and that opinion has been often supported. But building land stands in a different position, and the possession of a small site in the suburbs of a town is not open to the objections which advocates of farming on a large scale can bring against the French and Belgian *petite culture*. Every one but proprietors are aware that building suffers by the leasehold system. In the first place, it is only necessity, or the expectation of large profit in a limited time, that makes a man build on a terminable lease, and owners of such buildings of late years find greater difficulties in disposing of them. The reasons for retaining the system are so unimportant, it may be supposed that the publication of the Foreign Office reports is but an indication of an attempt to grapple with a system which has had a malign influence on English architecture.

DURING winter evenings, when in so many houses defective lighting adds to the discomforts of life, it will be well to bear in mind a suggestion which was offered by Mr. HAROLD DIXON in one of his Cantor lectures. Coal gas as an illuminant would be much more popular with English people if the makers of the globes which are commonly sold could be persuaded to make the openings through which the air enters just about double as large as they have made them. Openings of  $2\frac{3}{4}$  inches and 2 inches are quite common, and they are found as small as  $1\frac{3}{4}$  inches. Now, what is the effect of a globe with so small an opening on the burning of gas? The air comes in with a rush to the flame, and is thrown into eddies in pouring through the narrow orifice. Consequently, the flame is forced first on one side and then on the other, and it is in a continual state of flickering—always on the quiver, never still for half a second. It is this continual flickering when one is reading that is the chief objection to coal gas as an illuminant, as we find it in most houses. Mr. DIXON says that if the opening is made big enough the flickering entirely ceases.

THE manufacture of iron and steel has always been a favourite pursuit of the Americans. The total production of the iron and steel works of the United States in 1880 was 7,256,140 tons, while in 1870 it was 3,655,215 tons, showing an increase of 3,609,925 tons, or 98.76 per cent. The production of pig iron in the United States reached its highest point in 1882, when 5,178,122 net tons, or 4,623,323 gross tons were produced. In 1883 the production was nearly as large, amounting to 5,146,972 net tons, or 4,595,510 gross tons (a net ton is 2,000 lbs., and a gross ton is about 2,240 lbs.). At the close of the year 1882 there were 417 furnaces in blast and 270 out of blast. At the close of the year 1883 there were 307 in blast and 376 out of blast. But few of the largest furnaces were blown out in 1883, the capacity for production, therefore, not being reduced as compared with 1882.

ACCORDING to Mr. BLODGETT, the American statistician, Philadelphia is primarily a city of residence, and its manufacturing is adapted to and in harmony with its character as such, and it is neither built nor occupied as manufacturing cities are elsewhere. No part of the city area is crowded as European manufacturing cities are. There is not one tenement house in it, nor is there any single locality in which employment is enforced or compulsory at any one industry. There are no narrow lanes, with squalid occupants living on the smallest possible wages, and there is no exclusive occupancy or oppressive localisation in any part of the city. Philadelphia would consequently seem to be a desirable place for architects. The population is nearly a million, about 25 per cent. of whom are directly engaged in productive industries. According to the latest returns there are 156 architects and builders in the city, which, considering the elastic nature of statistics, does not appear to

be a sufficient number. Architectural woodwork gives employment to 35 men, who produce work that is valued at 66,000 dollars. Eleven artists are engaged in copying oil pictures, and they add 38,000 dollars to the returns. The value of the bricks is put down at three millions.

A "SMOKE ROCKET" has been designed by Mr. COSMO INNES, of the London Sanitary Protection Association, and its use is proposed as an effectual means of discovering leakages in drains. It has not been patented. The rocket is filled with a composition by Mr. PAIN, the maker of fireworks, and as one will burn for about ten minutes, there is sufficient time for the inspector to light the fuse, insert the rocket in the drain, insert a plug behind it, and walk through the house to see if the smoke escapes at any point, finishing on the roof, where he will find the smoke issuing in volumes from the ventilating pipes. If it is considered necessary to increase the severity of the test, a wet cloth can be thrown over the top of the ventilating-pipe. Experiments have been made with the rockets in unoccupied houses in Kensington, and they sustained the test, as the whole of the smoke issued from the top of the pipes; but it would be well to use the rocket in a house that was known to have defective drains. The invention appears to be a handy and useful addition to sanitary appliances.

THE necessity of having agreements stamped was shown lately in a case which was sent from the High Court to be heard in the Gloucester County Court. A carpenter, who was a specialist as a staircase hand, took a sub-contract from a builder for work in a house in Cheltenham. The architect declined to certify that the work of the staircases was satisfactory, and the builder refused to pay more money, maintaining that the sub-contract was taken on the same terms as the general contract, and by which the architect's certificate was indispensable to a settlement. When the agreement between the parties was produced in Court it was found to be without a stamp, and therefore could not be admitted as evidence unless a penalty of 10*l.* was paid. As the plaintiff declined to do so, he was non-suited, and the money which had been paid into Court by the defendant was allowed to be withdrawn.

Mr. T. N. DEANE, R.H.A., has discovered the remains of a large church among the ruins of Mellifont Abbey in Ireland. There seems to have been no record of the existence of the building (which is in the early thirteenth-century style), and the discovery is regarded with much interest by archæologists.

A VERY good programme for the ensuing session has been got up by the Council of the Society for the Encouragement of the Fine Arts. Between January 29 and June 11 there will be lectures on "Welsh Music," "Wall Papers," "Folk-lore and Music of Old Japan," "Physiology in Art," "English Art," "Architecture in the Nineteenth Century," "The New Æsthetics and Footprints of the Beautiful." There will be three conversazioni, and when it is considered that all that has to be paid is a guinea a year, the Council are again justified in saying that no other society provides a more happy combination of instruction and entertainment for so moderate a subscription.

AN important arbitration case is being heard before Sir HENRY A. HUNT, with Sir FREDERICK BRAMWELL and Mr. JAMES ABERNETHY as arbiters, at the Surveyors' Institute, Westminster. Already several days have been occupied. The plaintiff is Lord BLANTYRE, who claims 100,000*l.* from the Clyde Trustees for damage to his property, which is adjacent to the river. It is alleged that a training-wall which had been erected many years ago has caused a tendency to deposit mud on the land, and one of the points in dispute is whether a part is to be considered as belonging to the river bed. The depreciation of Lord BLANTYRE's mansion-house is among the items. Mr. DEAS estimated the amount at ten per cent., or 16,926*l.*, Mr. BUCHAN at 18,400*l.*, and Mr. SELLARS agreed generally with the estimates. The cost of Erskine House was 64,000*l.*, which, it appears, is one hundred and eighty years' purchase of the annual value entered in the valuation lists.

THE HISTORY OF ART.

DECORATIVE FRIEZE

BY MONS<sup>IEUR</sup> FRANÇOIS EH RMANN

INK-PHOTO. SPRAGUE & CO. LONDON.

AN INTERIOR  
DESIGNED BY E. F. C. LAY  
SHOWING JAPANESE DECORATION & BY

910th 1885.

OR .  
ARCHITECT.  
SR. ROTTMANN, STROME & CO

## ILLUSTRATIONS.

THE HISTORY OF ART.

THE splendid frieze which we reproduce this week is the work of M. FRANÇOIS EHLMANN, an artist who ranks among the leading decorative painters in France. It was M. EHLMANN'S design which was carried out as the adornment of the French department in the late Amsterdam Exhibition. The frieze that is illustrated surrounds a cupola over a staircase in the house of M. GÉRARD, Place St.-George's, Paris. A few remarks on the subject will be found elsewhere.

## AN INTERIOR.

THIS illustration is taken from a water-colour drawing by Mr. E. F. C. CLARKE, which was shown in the Health Exhibition. The original suggested how much use could be made of the wall-paper and decorative articles which have been imported from Japan by Messrs. ROTTMANN, STROME & Co., of St. Mary Axe; but the illustration labours under the drawback of not being suggestive of colour. We have already described Messrs. ROTTMANN, STROME & Co.'s warehouse, which is unparalleled in London or in any of the Continental cities. It is only by a visit that one can realise what magnificent papers are now produced, under the direction of the firm, by Japanese artists. But wall-papers form but a part of the collection in the warehouse, which is a perfect emporium of the costliest and the cheapest kinds of Japanese art workmanship.

## THE ARCHITECTURAL ASSOCIATION.

THE sixth ordinary meeting of the Association was held on Friday evening, the 2nd inst., Mr. Cole A. Adams, president, in the chair.

Mr. SLATER was elected a member by acclamation.

Mr. SHUFFREY was to have read a paper, but at the last moment begged to be excused for unavoidable reasons.

The PRESIDENT opened a discussion on architectural education, and how to improve and make more efficient the system of the Association. In discussing the question he desired the junior members to take precedence. The chief points in the President's paper may be summarised as follows:—

## Architectural Education.

The PRESIDENT began by showing what other learned professions had done in the way of education, and how no member of such professions could hope to rise to high distinction who had not devoted all his energies to acquire his knowledge, both theoretical and technical. But, till lately, architects had followed on the old lines, and not recognised the enormous progress in education going on around them. What the Association had done, and the examinations by the Institute, proved a want was felt, and that architects were beginning to see that if they were to hold their position at all as a learned profession they must qualify themselves to meet all the difficulties of modern practice. Iron and bridge construction, and much else where science of construction on a large scale was concerned, had drifted away from architects. Decoration had gone into the hands of specialists, who were not architects. To win back what was legitimately theirs, they must qualify themselves, and so prove to the public their competence. In art and literature men had won foremost places by their own efforts, and in art and literature it might be proved that the man who succeeded must be born, not made. But science formed a necessary part of architecture, and science could and must be taught by system. The day for the old argument, that systematic and academical education was unnecessary was past and gone. Society was educated, and would take nothing for granted; they required to know the why and the wherefore. Criticism was cast in all directions. Sanitary questions cropped up on all sides, and specialists rose up to answer them. The public demanded special knowledge to be brought to bear. Neither natural instinct nor any slipshod system would succeed. The President said the question for the evening was, Whether the education of the architect could be improved, and if so, how?

The Association, justly proud of what it had done in the past, was considering how to improve and make more effective its system. Courses of lectures to prepare candidates for admission to the Institute by examination had been instituted. The members who gave the lectures received a slight remuneration in no way commensurate with the demands made on their time and skill. This had been a departure from the honorary basis on which instruction in the Association rested. It was a

natural outcome of the Institute examination, and had done good service. The classes under honorary teachers had done excellent work, but must necessarily fall short of producing a uniform standard of excellence. Necessarily, also, the teachers constantly changed, nor could they be expected to give up their time, year after year. To the question of how to supplement their system and make the instruction more thorough, there seemed only this answer, that they must secure the services of men, qualified professors of the subjects they teach. By all means, said the President, let us keep our classes, careful only in the selection of those who preside over them, but let us go further and try and obtain lecturers to deal with those special subjects which can only be properly taught by men trained to speak with the authority of experience, and qualified to impart their knowledge to our students. We are at once met with the question, Where is the money to come from that will make it worth while for men capable of teaching to give up their time to undertake the post of lecturers? I think, if we are in earnest about it, the thing may be done. The Royal Institute of British Architects was founded for the promotion of the art of architecture; but beyond establishing an examination for admission to its ranks, it has done, as far as I can gather, nothing for education. Is not the present time, when such great changes in its constitution are under discussion, one for meeting this question of education? To what better use could funds of the Institute be put? How better can it raise itself in the eyes of the profession, gather men into its body, and make itself great, powerful, and respected, than in extending by its funds the opportunities for acquiring knowledge? The fact that an examination for admission to the Institute is compulsory surely demands that the Institute should place before students some of the means for passing that examination. I believe an educational scheme would commend itself to the members of the Institute, and that if a committee of the Institute and the Association were formed, and ways and means discussed, a course of lectures by competent men might be set on foot, and the two bodies would be drawn together on a footing which would not interfere with the constitution and independence of either, but only result in good for both, and a closer alliance for strength and resistance against those who have made and are busy making inroads upon us. The Institute would gain in popularity, would commend itself more to the sympathy and support of its members and the profession, and gather students to its meetings and lectures; the Association would be more valued, and admission to its ranks would be even more sought after than it is at present. The standard of education would be raised, and the men who came under the influence of it would in turn make it felt abroad, and little by little the public would come to recognise that to be an architect, properly qualified to carry out the work entrusted to him, requires that a man shall be properly and systematically educated in the various branches of his profession, and that only those who possess this knowledge will stand a fair chance of employment. There is no reason why, in the large centres of industry in the provinces, a modified system such as I have sketched should not be established. One thing is clear—if we do not, no one else will.

Mr. A. B. PITE said as to the question of architectural education, he failed to see in what special arts our leading architects, by whom English architecture must stand or fall, needed education. Architecture resulted in the survival of the fittest. The beautiful buildings of the past remained, the bad had disappeared. It seemed needless to take trouble about bad architecture in the present, as art would kill it. The public required educating more than architects. He was glad that the public had made a step in this direction, and learned that there was such a thing as style. There was no better test of the efficiency of methods of architectural training than the test of results. Over and over again they had heard of the superiority of the Continental systems over our own. Judged by the test of results, English architects, acquainted with the work done abroad, would never be ashamed to hold up our own school of architecture against the schools of France, Germany, or Italy. Methods of education abroad might be superior to ours, but the results certainly spoke in our favour. Our great architects had picked up their knowledge in a haphazard way from miscellaneous sources, but knowledge so gained was sorted out in order in the architect's mind. Though you might educate a man in sanitary science and in all branches of scientific architecture, so to speak, you would not make an architect of him. You might put into his mind what would make him a builder, a surveyor, and the like, but you could not put art into him. So the question came, In what must you educate the young architect? Their own system in the Association seemed to be in a particularly healthy state, for no one came and attended the classes but such as were really in earnest to succeed. The system could hardly be improved in any specific way, but competition could be encouraged by enhancing the value or number of prizes. Mr. Pite moved a vote of thanks to the President for the paper he had prepared at so short a notice.

Mr. MILLARD spoke of the time wasted in training an

architect, who spent more years in getting his knowledge than he need do if an efficient system of education existed. If they agreed that a systematic training was necessary, what kind of system should be followed? No two men were alike, and any system adopted must clearly be one sufficiently elastic to suit itself, as far as possible, to all varieties of students' minds. The main system here was pupilage. A pupil was articled to an architect for a term of years. But why not article a pupil for one year, and make it optional to renew the engagement year by year? A parent withdrew his son from school after a year's trial if he found no benefit was derived. Again, the architect's pupil, instead of taking one subject after another in order, had many subjects all at once, from superintending building works to designing ornament. The average student could not master all at once, and the question arose, In what order should he take them? He would send him to an art school first, and to an office afterwards. To an art school to learn drawing, and accustom his eye to delicacy of proportion, as well as to find out what was really in him, instead of crushing the life out of him by practical matters that should come later. If the student showed artistic tendencies, they should be aroused and developed; practical matters would easily be acquired when the need for them came. In the office he should be allowed the experience of carrying out some work, however small—a lodge, for instance, under the guidance of his master, of course, but doing the whole himself, the design, the specification, acting as clerk of works, &c. He would thus get the money worth of his premium, and leave the office with some definite knowledge. The difficulty would be to get into a good office. The Association might possibly found a scholarship to enter a man into one of the best London offices. Leading architects would, no doubt, readily listen to a request from the Association. But they should not make one scholarship or travelling studentship the limit. Students of to-day would be the architects of to-morrow, and what was done now would influence the architecture of the next fifty years. Enthusiasm was an essential to success. There was plenty of it; men were ready to work, but they wanted guidance—a leader who would exert his influence over them, such as Arnold at Rugby, Newman at Oxford, Gordon in Khartoum.

Mr. FARROW said he remembered a passage in which Sir Gilbert Scott or Mr. Street had said that artistic buildings existed not on account of their artistic qualities but on account of their good building, and that good building and good architecture were concurrent, and so what was bad was swept away. As to men of genius becoming great architects, and their knowledge having being acquired in a haphazard way, it should be remembered that they paid a high price for it, and passed away at an early age, like Mr. Burges, Mr. Street and others. Their work would have been easier, their life longer, and their art would not have been less, had they had the advantages of systematic education. Mr. Pite spoke as an artist, but their art was not only art but a profession and a science. Art might be inborn, but science could be learned, and a scientific education, as the President pointed out, required systematic and careful study. In some professions students were grounded first of all in the theoretical branches, and afterwards in the practical; this was the case in the army and navy. In other professions, as in the legal, the two were combined as far as possible together. In Austria, a boy of sixteen, on leaving school, entered a technical high school for a course of study, then an academy of fine art, where only the principles of art and design were taught. The following year he went as a journeyman bricklayer, carpenter, &c., then entered an architect's office for a year, and next spent a year in the army. The Austrian received a practical, and as far as could be, an artistic education. The system did not reduce men to one dead level, but enabled a man to find out what he was best fitted for, and also accounted for what seemed so extraordinary in Austria, namely, the extent to which specialists were employed. The ideal course of instruction, he thought, should be scholastic education for a period of years, followed by training in an architect's office, and afterward practical work at the carpenter's bench, acting as clerk of works, &c.

A letter was then read from Mr. Blashill, who was unable to attend. He advocated the necessity of real work, and instanced a prominent feature in the training of medical students, viz., walking the hospitals. Windy orations and too much archæology he condemned. Medical students went to sleep in the lecture-hall, but were all energy when in the dissecting-room.

Mr. LOVEGROVE said that no other profession in this country allowed its members to learn its mysteries in such a piecemeal way. Looking at the buildings abroad, one could see that the men who built them had received an academical training. He did not agree with Mr. Pite's remarks with regard to inborn genius superseding the need of training, for one did not find a poet was a worse poet for having graduated. He would like more attention to be given by the Association to the teaching of the principles of design, apart from the question of style, and also to see a more extended course of study of deco-

ration, and to see it aim at more thoroughness and completeness in the course of education, that they might at least be equal in culture to those around them.

Mr. SLATER held that students left school too young, and with their minds not sufficiently trained to take in what they had to learn afterwards, and too young to know what their professional bent really was. This point ought to be impressed on the public, as parents thought—they did not think so with regard to other professions—that putting a boy of fourteen years of age in an architect's office was all that was necessary to fit him to do a great deal of complicated work in the future. Mr. Slater urged the great importance of languages, which opened so many stores of knowledge to the student. The earnest students who attended the classes of the Association were not the only persons who became architects. A great number of students did not come to the classes or go elsewhere, because they did not know where to go, and for these something must be done. The lectures proposed by the President would do much good.

Professor T. ROGER SMITH said he could not remember the long list of members in the Brown Book without feeling that competition among architects would be very great in the future, and that those would rise to the top of the profession who had availed themselves to the utmost of their advantages. He agreed with Mr. Slater on the necessity of a certain amount of culture before entering the profession at all. For instance, they should be able to pass with facility the local examinations in connection with the Universities. No method would in this country succeed so well as articling the student or putting him in some way into an architect's office, for he must, as Mr. Blashill said, be brought in contact with practical work. Before entering the office they should spend some time in an art school and learn to draw the human figure respectably, and perhaps have a slight knowledge of colour. The next six months might be passed at the carpenter's bench to learn how working drawings were carried out, &c. As to practice, a great deal must be superadded, and for that in part they would come to him at University College, where the work was tolerably continuous or systematic, each class going on week after week, taking up their subjects in rotation, and getting a certain amount of knowledge, which they would add to afterwards. In the Association, as far as utilising the facilities already offered, he suggested they should aim at some such continuity of study as practised in the University College. Some recognised order might be established, or, perhaps even better, an office created to be filled by a "students' friend"—a person who would see what the student knew and what he did not, and sketch out a course of study suited to him. Mr. Roger Smith concluded by endorsing Mr. Slater's ideas as to languages, and suggested that the Association might do something in the way of freehand drawing—a thing not to be learnt in an office; and thought a class of drawing from the antique might be started, as also a joiner's shop.

Mr. TARVER spoke in favour of the plan suggested of articling a pupil by the year.

Mr. LAWRENCE HARVEY said that if Mr. Norman Shaw had been taught in a French Academy, he would never have been the architect that he now was. Before entering the profession a student should be taught all sciences that bore on building. Parents often put their sons into the profession thinking it was a paying business. But it was not. To enter the profession a man must have such a love of architecture that he was determined to be an architect even if he were to be poor. If anyone wished to make money by architecture his advice was that they should not know more about architecture than they could help. Let them try rather to be an amusing companion at the dinner-table, and to be able to tell a clever story, &c.

After a word or two from the President, the vote of thanks was, on the motion of Mr. Pite, carried by acclamation, and the proceedings terminated.

### THE ROYAL ACADEMY.

THE following students have been admitted in the classes in the architectural school:—

*Upper School.*—F. S. Capon, H. Cresswell, E. J. G. Dawber, G. Horsley, A. B. Pite, A. D. Smith, H. J. Westell.

*Lower School.*—P. Anderson, N. W. Allen, R. S. Ayling, W. H. Boney, W. A. Burr, W. L. Buxton, F. M. Day, H. P. B. Downing, L. Dennis, H. Druery, L. R. Ford, C. Gill, G. Harvey, F. H. Hitchin, W. H. Howie, H. Hutchings, A. R. Jemmett, A. J. Lancaster, W. Leck, H. C. Manning, F. W. Marks, F. Masey, C. L. Meadway, W. Newton, R. O. B. North, W. R. Schultz, A. Steinthal, Van Straaten, A. Sykes, A. S. Taylor, J. B. Thorpe, F. G. Webb.

*Probationers.*—W. Alford, A. E. Barnsley, F. D. Bedford, W. T. Cave, F. Davison, C. D. Fitzroy, P. N. Ginhams, J. E. Inglis, F. J. James, G. L. Jones, G. T. McCombie, R. F. McDonald.

## PETERBOROUGH CATHEDRAL.

THE reply of Mr. E. A. Freeman to the letter of Sir Edmund Beckett contains the following observations on the general question of restoration:—It seems to me, as to many others, that our great churches and other works of ancient architecture are—subject, of course, to the needs of their practical use—beyond all things historical monuments. It is not our business either to improve on them out of our own heads or to try to bring them back to the state in which we may fancy them to have been 400 years back, or 500 years, or any other date that may best suit our private tastes. The historical monument has commonly been made what it is by a series of changes which form its history. The result of that history is the building as it stands. In that shape it is an historical possession. The question of dealing with quite modern changes may admit of fair differences of opinion; but surely, as a general rule, all changes at least down to the middle of the seventeenth century are part of the continuous history of the building. All should be preserved. Nothing but the most urgent practical need can justify any interference with any of them. The personality, so to speak, of the building, that which gives Peterborough or any other great building a character of its own, is the result, not of the work of any one period, but of the combined work of all periods.

Preservation may in some cases involve reconstruction. If I rightly understand the case at Peterborough, the mid tower was taken down in order to save it from falling down. This was a thoroughly conservative process, undertaken to preserve the history and personality of the building. But in order to carry out this conservative work the rebuilding should be simply a rebuilding—a putting back of things into the state in which they were before—and that, as far as may be possible, with the old stones. It is not fair to turn this necessary work into an opportunity for making something new—for turning the building into something different from what it is, something like what it may have been in the thirteenth or any other century, or something into which somebody may improve it in the nineteenth century. We do not want a new minster of Peterborough, even though it were to be much better than the present one. We want to keep that minster of Peterborough which is the result of the actual history of Peterborough, that minster which I for one have known for more than forty years, and which has for me a personality of its own which any change in its outline would disturb.

Thus far the argument is common to Peterborough with all other ancient buildings. But there are further special reasons against in any way interfering with the outline of Peterborough Minster as it lately stood. The church once had a Romanesque mid tower. This is a very noble feature at Norwich; it may well have been equally noble at Peterborough. But the history of the two churches has been different. Norwich has never had anything to be called a west front. The mid tower is more than the centre of the building; it is the main feature which rules everything; one might almost say it is the building itself. The addition of the most beautiful west front that could be designed would be undesirable at Norwich, for it could not fail to destroy the existing outline—an outline in which the single great tower is everything.

At Peterborough the history has gone the other way. Everything was changed by the addition of the western portico, to my mind the noblest work of the building art. That portico is at Peterborough all that the tower is at Norwich, and more also. It is the main feature, the characteristic feature, that which makes the church what it is. But it is yet more. There are other grand mid towers besides Norwich; but the portico of Peterborough stands by itself in the whole world. There is nothing like it, nothing second to it. When the mid tower fell, it was a gain; a tall tower rising behind the portico could never have harmonised with the peculiar character which the addition of the portico had given to the church. That portico is a Greek conception translated into Mediæval detail. It has given the building an outline which is rather Greek than Mediæval. The ruling lines are horizontal. A tall tower is as much out of place as if it were added to a Greek temple. When, therefore, the tower fell, the existing convent of Peterborough, whether wittingly or unwittingly, did wisely in not rebuilding it. They marked the crossing and no more. They gave the church the outline which the addition of the portico made necessary. Since that time the characteristic and unique feature of the church has reigned in its solitary majesty. I can conceive no greater offence against art and history than to add anything to Peterborough Minster that can disturb its supremacy.

I earnestly trust, then, that the Chapter will abide in the mind in which I found a majority of that body on December 9. Let them rebuild the low mid tower exactly as it was, only making Dean Kipling's turrets a little lower. They are really by no means bad. Builders of his day often caught an outline more happily than their successors, who knew more of detail.

Sir Edmund Beckett seems pleased with his work at St.

Albans, and it seems that Mr. Fergusson is pleased too. There is no accounting for tastes. When I heard that Sir Edmund had been to Peterborough I fell into a Mediæval vein, and pictured to myself St. Peter of Burgh greeting his approach with some such words of welcome as "Wilt thou kill me, as thou killedst my brother Alban yesterday?"

"Antiquity after a time has the grace of novelty."—HAZLITT.

## NAPOLEON ON ARCHITECTURE AND "THE MADELEINE," PARIS.

EVERYONE knows that the Madeleine is one of the principal buildings in Paris. A chapel stood on the site from time immemorial. A church was erected there in 1487, and it was supplanted by another in 1659. A new building was undertaken in 1763, according to designs by Contant d'Ivry, but the architect died before the works were completed. His successor, Guillaume Couture, prepared new plans and demolished all the masonry which had been executed. Then came the Revolution. Napoleon wished to transform the building into a Temple of Glory, in which the statues of his chiefs could be placed, and the records of his campaigns inscribed on plates of metal and marble. There was a competition among architects, and the design of M. Vignon was selected by the Emperor. The following interesting letter on the subject was addressed to the Duc de Cadore, and it suggests that Napoleon was as prescient in relation to architecture as to war or codification. The letter becomes more remarkable if we recollect that at the time it was written Napoleon was making preparations for the great battle of Friedland, and that a few months before he had been defeated at Eylau:—

"Finkemstein: 30th May, 1807.

"Monsieur de Champagny,—After having attentively examined the different plans of the monument dedicated to the grand army, I have not been one moment in doubt. That of M. Vignon is the only one which fulfils my intentions. It is a temple that I demanded, and not a church. What could be done in the style of churches to surpass St. Geneviève or even Notre Dame, and, above all, St. Peter's at Rome? The project of M. Vignon unites with many advantages that of agreeing much better in style with the palace of the legislative body, and of not humiliating the Tuileries. When I fixed the expense at three millions (120,000*l.*) I wished it to be understood that this temple ought not to cost more than that of Athens, the construction of which did not cost half that sum. It appears to me that the Court entrance ought to be by the staircase opposite to the throne. In the definitive plan M. Vignon will manage so that we may descend under cover. The apartment, also, must be as handsome as possible. M. Vignon might, perhaps, make it double; for the hall is at present too long. It will be equally easy to add a few tribunes. I will have nothing in wood. The spectators ought to be placed, as I said, on marble steps, forming amphitheatres destined for the public. The persons necessary for the ceremony will be placed on benches, so that the distinction between the two classes of spectators may be very sensible. The amphitheatres, filled with ladies, will form a contrast with the grave costume of the personages necessary for the ceremony. The tribune of the orator ought to be permanent, and of beautiful workmanship. In this temple nothing ought to be movable or changing; every thing, on the contrary, ought to be stable and fixed in its place. If it were possible to place at the entrance of the temple groups of *The Nile* and *The Tiber*, which were brought from Rome, it would have a good effect. M. Vignon must endeavour to introduce them in his ultimate plan. The place must also be selected for the armour of Francis I., and the *quadriga* of Berlin. There must be no wood in the construction of this temple. Why may not we employ for the dome, which has been an object of discussion, iron, or even earthen pots? Would not these materials be preferable to wood? In a temple destined to subsist several thousands of years the greatest solidity possible must be studied, and every thing avoided that may be subject to criticism; and the greatest attention paid to the choice of materials. Granite or iron ought to be those of this monument. It may be objected that the present columns are not of granite; but this objection is not a good one, because in time they may be changed, without injury to the monument. Yet, if it were proved that to use granite would cost too much, and be too long in obtaining, we must renounce it; for the principal condition of the project is that it shall be executed in three or four years, or at the most five. This monument has a political object; it therefore should be terminated quickly. It will be well, however, to seek for

granite for other works which I shall order, and which, from their nature, may occupy thirty, forty, or fifty years in finishing. I intend all sculptures in the interior to be of marble. Do not propose to me any sculptures fit for the drawing and dining-rooms of the wives of Paris bankers. Whatever is futile is not simple, noble; whatever is not of a long duration is unfit for this monument. I repeat that there must be no kind of furniture in it, not even curtains. As to the plan which has gained the prize, it does not reach my ideas; it was the first that I rejected. It is true I gave for a basis to preserve part of the monument of the Magdalen as it exists; but this expression is an ellipsis—it was to be understood that whatever was possible should be preserved, otherwise there would have been no need of a programme; it was only necessary to execute the original plan. My intention is not to have a church, but a temple; and I neither wished that all should be pulled down nor preserved. If the two propositions were incompatible, namely, that of having a temple or preserving the church of the Magdalen, it was right to attend to the definition of a temple. By temple I mean a monument, such as there was at Athens, and as there is not at Paris. There are many churches at Paris; these are in every village. I should not have taken it ill if the contradiction had been pointed out between having a temple and preserving what was intended for a church. The first was the principal idea, the second only accessory—M. Vignon, therefore, divined what I meant. As to the expense fixed at three millions, I do not make it an absolute condition; I wished to be understood that I would not have another Pantheon—that of St. Geneviève has already cost about fifteen millions. But, in saying three millions, I did not mean that a million or two more should enter into the comparison with having a more or less beautiful monument. I might, if necessary, order five or even six millions; the definitive plan will regulate this.

"You will not fail to tell the fourth class of the Institute that it was in its own report that I discovered the motives which have determined me. On which I pray God to have you in His holy keeping."  
"NAPOLEON."

#### AN ENGLISH INCOHERENT EXHIBITION.

The exhibitions of "Incoherent Art" which have been lately introduced in Paris are not original, although they are supposed to be a special product of French wit. As far back as 1762, that is, seven years before the opening of the Royal Academy, an exhibition of the kind was held in Bow Street, Covent Garden. It was organised by Bonnel Thornton, who was the leading spirit of the *Connoisseur*. He was aided by William Hogarth. In 1762 the Society for the Encouragement of Arts, Manufactures, &c., and the Society of Artists, proposed to hold exhibitions, and for fun Thornton got up a third, which was declared to be under the auspices of the Society of Sign-Painters. It was announced that it was to contain "a most magnificent collection of portraits, landscapes, fancy pieces, flower pieces, night pieces, scripture pieces, &c., &c., designed by the ablest masters, and executed by the best hands in the kingdom." It was also declared in the gravest manner that the worshipful sign-painters were not prompted by any mean jealousy of the members of the other societies, for, "animated by the same public spirit, their sole view is to convince foreigners, as well as their own blinded countrymen, that however inferior this nation may be unjustly deemed in other branches of the polite arts, the palm for sign-painting must be universally ceded to us, the Dutch themselves not excepted." The strange sight that was presented to the visitors may be imagined from the description in the *London Register* of that time:—

"On entering you pass through a large parlour and paved yard, of which, as they contain nothing but old common signs, we shall take no further notice than what is said of them in the catalogue, which the reader will not find to be barren of wit and humour. On entering the grand room, you find yourself in a large and commodious apartment, hung round with green baize, on which this curious collection of wooden originals is fixed flat, and from whence hang keys, bells, swords, poles, sugar-loaves, tobacco-rolls, candles, and other ornamental figures, carved in wood, which commonly dangled from the pent-houses of the different shops in our streets. On the chimney-board (to imitate the style of the catalogue) is a large blazing fire, painted in water-colours; and within a kind of cupola, or rather dome, which lets the light into the room, is written in golden capitals, upon a blue ground, a motto disposed in the form following:—

SPECTATUM  
TENEATIS  
ADMISIT  
RISUM

"From this short description of the grand room (when we consider the singular nature of the paintings themselves, and

the peculiarity of the other decorations), it may be easily imagined that no connoisseur who has made the tour of Europe ever entered a picture gallery that struck his eye more forcibly at first sight, or provoked his attention with more extraordinary appearance."

The pictures were remarkable. Thus, for example, *The Irish Arms*, by Mr. O'Blaney, represented a pair of extremely thick legs in white stockings and black garters; *A Man* was a view of nine tailors at work; *Nobody alias Somebody—a Character*, was an officer all head, arms, legs, and thighs. But, according to the *Register*, "the cream of the whole jest is No. 49 and No. 50, its companion, hanging on each side of the chimney. These two are by an unknown hand, the exhibition having been favoured with them from an unknown quarter. Ladies and gentlemen are requested not to finger them, as they are concealed by blue curtains to preserve them. Behind the curtains are two boards, on one of which is written 'Ha! ha! ha!' and on the other 'He! he! he!' At the opening of the exhibition, the ladies had infinite curiosity to know what was behind the curtains, but were afraid to gratify it. This covered laugh is no bad satire on the indecent pictures in some collections, hung up in the same manner with curtains over them." An opportunity was offered to amateurs to display their skill in identifying the works, and it was stated that "a remarkable *cognoscente*, who has attended at the society's great room with his eyeglass for several mornings, has already piqued himself on discovering the famous painter of *The Rising Sun* (a modern Claude) in an elegant night piece of the Man in the Moon." The *St. James's Chronicle* of that day could not see any humour in the exhibition, and the charge of a shilling was said to be a swindle; and, after a condemnation of the affair, wound up by saying:—"In fine, this exhibition is a most scandalous abuse and bubble. The best entertainment it can afford is that of standing in the street and observing with how much shame in their faces the people come out of the house."

#### METROPOLITAN WATER SUPPLY.

THE reports of Mr. J. T. Harrison, C.E., one of the engineer inspectors to the Local Government Board, on the sources of water supply to the metropolis have been issued. The author believes that an abundant supply of water of unexceptionable quality can be obtained and delivered by the companies (more especially those who take water from the Thames) to the consumers without adding to, but not improbably diminishing, the annual cost which they at present incur. Mr. Harrison suggests that a supply should be derived from that part of the chalk formation within the watershed of the Thames which lies to the north and west of Windsor, including the areas within the basins of the rivers Kennet and Colne. This gathering ground occupies upwards of 1,100 square miles, or, say, 700,000 acres, and varies considerably in elevation. The saturated chalk contains one-third of its bulk of water. The chalk formation thus forms, at the same time, an extensive gathering ground of a very permeable character, and an enormous reservoir coextensive with the surface, and in some places several hundred feet in depth. The existence of such a reservoir and the fact that water passes very slowly, except by fissures, through the chalk formation, explain how the perennial flow of the Thames is equalised and its continuance insured even after a long-continued drought.

A large receiving-well might be constructed at Black Pots, near the main road from Eton and Upton to Datchet, with an overflow into the Thames below the Windsor Lock. The summer level of the Thames below this lock is 51.33 feet above Ordnance datum. From this well a tunnel might be driven westward, by Chalvey Grove and the West Town Farm, to the Thames near Bray, 12 feet in diameter for a considerable length (say one mile), rising 1 foot 6 inches per mile, thence diminishing, as it might be found desirable, to 10 feet, 8 feet, 6 feet, and 4 feet in diameter, with the same inclination; the invert of the tunnel being raised at each break from the Black Pots, where it is 40 feet above Ordnance datum, or about 16 feet below the summer level of the Thames above Windsor Lock. This design would, of course, be modified very considerably should a more definite scheme be prepared, and after borings have been sunk and the position of fissures, as far as possible, ascertained. It will probably be found desirable to sink wells into the chalk at various places near the tunnel, and to drive headings northward from it. It is quite impossible at present to determine exactly what should be done. The tunnel should be below the summer level of the Thames throughout its length, and should be carried in the chalk and below the gravel. It would probably be found convenient to construct the main carrier before driving the gathering tunnel, in order to carry off the water during the execution of the work; but this is a matter of detail and of cost only, to avoid pumping.

The five companies who take their supply from the Thames draw it from the same reach of the river. The summer level

of the Thames is here about 23·38 feet above Ordnance datum. The overflow weir, constructed at the lower end of the main carrier, should be several feet above this level, so that the water could be conveyed in 4 feet cast-iron mains to the pumping wells of each company. The length of these distributing mains would be about two miles. Two of them would have to be carried across the Thames.

This well and overflow weir might be constructed near the Grand Junction works at Hampton, and a main carrier between this well and the well at the Black Pots, Windsor, might be built. This main would be 12 feet in diameter, and 11 miles long, with an inclination of 1 foot per mile; the invert at Hampton being 20 feet above Ordnance datum, and 31 feet above it at the Black Pots. It may be found desirable to carry this main at a little lower level, in order to form it in the clay at a sufficient depth below the gravel. In that case, when in operation the main carrier would be quite full and slightly under pressure. The tunnel should be lined with 14-inch brickwork in cement, with shafts or manholes at about every quarter of a mile. It would be easy to take in water from the gravel at some of these shafts, if it were, in consequence of the character of the water or otherwise, found desirable to do so.

A strip of land, 100 feet wide, should be purchased the whole length of the main carrier and the collecting tunnel; and power should be obtained to sink wells at any points throughout this length, and to drive headings or drifts, for the collection of water, in any direction throughout an area of about five miles by four miles in the neighbourhood of Farnham Royal, Maidenhead, Bray, Windsor, and Slough.

The purchase of land and the cost of the works required to collect the water, to convey it to Hampton, and to distribute it to the pumping stations of the several companies, would probably amount to about 700,000*l*.

The annual cost of filtering the water taken from the Thames for the supply of London is 8,424*l*. As no filtration would be required, this annual expenditure would be saved. Several of the reservoirs would be rendered useless, and, as they occupy valuable sites, the annual cost of maintaining them and the value receivable for the sites should be put against the cost of the proposed works. The water companies pay at present 10,000*l*. a year to the Thames Conservancy Board, but Parliament will probably relieve them from this payment if the supply were taken from springs instead of from the Thames.

### THE LATE MR. R. M. PHIPSON.

IT is with regret we announce the death of Mr. Richard Makilwaine Phipson, of Norwich, an architect who gained the esteem of every one who met him, whether on business or in relation to archaeology.

Mr. Phipson, says the *Ipswich Journal*, was a well-known figure throughout East Anglia, the struggle of youth and early manhood being associated with the capital of Suffolk, and the success of mature years more particularly with the cathedral city of Norwich. Old Ipswichians, especially gentlemen of archaeological tastes, talk with enthusiastic pride of a certain young man who, more than thirty-five years ago, gained the esteem and confidence of his fellow-townsmen by his devotion to archaeological pursuits and his clever architectural designs. Young Phipson was articled to the late Mr. W. Clarke, the architect of the Ipswich Custom House and other buildings. On the decease of his employer, Mr. Phipson acquired the practice, and locating himself at the Ancient House, he rapidly developed the business. The famous relic chosen for his office was judiciously restored under his superintendence, all the ancient historic characteristics being most carefully preserved. The earlier years of the church restoration era found Mr. Phipson in the front rank as an ecclesiastical architect. Among his notable designs was that for the rebuilding of St. Mary Tower Church, Ipswich, and many Suffolk churches were enlarged and restored under his supervision. In domestic architecture, also, he was extensively employed, the Foundation Street Almshouses, Stoke Hall, Ipswich, Brandeston Hall, and other mansions testifying to his success in the profession he had adopted. Although not an artist, Mr. Phipson steadily promoted the occasional exhibitions gathered together by the efforts of Mr. Stephen Jackson, Mr. F. B. Russell, Mr. R. Burrows, and other local pioneers of the art exhibition movement. Mr. Phipson continued to reside in Ipswich until 1859. At the Norfolk October Quarter Sessions he was the chosen of twenty candidates for the appointment of surveyor to the county of Norfolk. Subsequent to his removal to Norwich, Mr. Phipson designed the present St. Giles's Church, many public buildings in the city and county, and numerous Norfolk churches. He held from 1871 the joint appointment of diocesan surveyor under the Ecclesiastical Dilapidations Act. Mr. Phipson was a member of the Norfolk and Norwich Archaeological Society, and of the Suffolk Institute of Archaeology and Natural History. Numerous papers from his pen

appear in the journals of these societies, and in that of the British Archaeological Society. He undertook and successfully carried through the arrangements for several visits of the parent association to East Anglia. Mr. Phipson married the daughter of the late Mr. George Bullen, surgeon, Carr Street, Ipswich, who survives him.

### THE ABERDEEN ART GALLERY.

THE late Mr. Alex. M'Donald, of the Aberdeen Granite Works, has, subject to the life-rent of his widow, bequeathed to the Town Council of Aberdeen on behalf of the community his collection of oil paintings, pen-and-ink drawings, and etchings, together with a third of the residue of his estate. The collection is a large and valuable one, including two works of Mr. Millais, two of Mr. Alma Tadema, Mr. Orchardson's *Napoleon on Board the Bellerophon*, several of Hook's sea pieces, and works by Joseph Israels, G. F. Watts, Jules Breton, P. D. Chalmers, George Reid, and others. The feature of the collection, however, is a portrait gallery of living artists, among these being Sir Fred. Leighton, Millais, Watts, Israels, Breton, Pettie, Orchardson, Tadema, Oulless, and Gregory. This gallery now numbers about eighty heads. Mr. M'Donald hoped that this collection, which has been the first attempt in this country to gather together the portraits of contemporary artists, might continue to be regarded as a pleasant and unique historical record of the artistic talent of the time. He desired to record that but for the hearty co-operation and interest in the undertaking by the artists themselves he could not have hoped to attain so satisfactory a result.

The whole collection of Mr. M'Donald's pictures is to be kept separate and distinct from other pictures in the gallery, and each picture is to be specifically labelled as part of the bequest. The third of Mr. M'Donald's estate bequeathed to the town is to be invested, and the revenue derived from it every third year is to be applied in the purchase of works of art for the Art Gallery. The revenue of the two years is to be added to the principal, and the fund is to be thus treated so long as the law will allow such accumulations, after which the whole of the revenue is to be set apart and applied in the purchase of paintings. In accordance with the will, no pictures painted more than twenty-five years before the date of purchase shall be eligible for purchase; no direct commission shall be given to any artist, but all pictures shall be finished before being considered eligible; and that in the purchase consideration is to be had only to the intrinsic merits of the work. The purchase of pictures and the whole management of the collection are to devolve upon an art committee of twelve members, eight to be appointed by the Town Council and four to be appointed by the Senatus of Aberdeen University.

The value of the art collection thus bequeathed to the city of Aberdeen is estimated at nearly 13,000*l*., and it is conjectured that a third of the residue of Mr. M'Donald's estate amounts to about 15,000*l*.

### HOUSE TENURE IN FRANCE.

IN last April Earl Granville asked the representatives of Great Britain on the Continent to obtain reports upon the system of tenure of dwelling-houses in the respective States where they resided. The information has now been printed. The following is Sir John Walsham's report on the French system:—

Since the Revolution of 1789 all property in France, whether urban or rural, is freehold ("franc-alieu"); that is to say, so long as there is no contravention of the law as regards the welfare of the community at large, the right of owners of property to deal with it as seems best to them is free and absolute.

By Article 537 of the French Civil Code, "Les particuliers ont la libre disposition des biens qui leur appartiennent sous les modifications établies par les lois;" and by Article 544 of the same Code, "la propriété est le droit de jouir et de disposer des choses de la manière la plus absolue, pourvu qu'on ne fasse pas un usage prohibé par les lois ou par les règlements."

According to statistics, land in France consists of some 28,000,000 holdings, divided amongst 5,000,000 proprietors, and each one of these 28,000,000 holdings can be sold or let at the good pleasure of the proprietor. Entail does not exist in France, and children share alike the real and personal estate of the parents.

With respect to the question of selling or letting property, the provisions of French law are equally applicable to urban and rural property, and considerable latitude is allowed to vendors and lessors as regards the conditions they may desire to attach to sales or leases, provided always that these conditions do not in any way interfere with police, municipal, or state regulations, and do not contravene either existing servi-

tudes and prescriptions, or infringe the rights and privileges of neighbours.

A lease is regarded by French law as a simple contract between two parties, into which any conditions may be introduced, subject to the above-mentioned general restrictions.

In France property can be sold, and is not unfrequently sold in small lots so as to enable persons to build houses on it. These sales may be unconditional, in which case the purchaser is bound by such restrictions only as are of usual application to buildings of all kinds, and refer to the character of the work done, to sanitary arrangements, and to the consideration due to neighbours.

On the other hand, the vendor may sell, subject to the reservation of an annual rent or other periodical payment, and with or without the right of redemption. He is also at liberty to require that the purchaser shall complete the building within a given time and in a particular manner. Such restrictions are set forth in a deed of sale, and are terminable only with the deed. In other words, the vendor is entitled in perpetuity to have the clauses of the covenant executed, and such right would descend to his heirs, or to his legal representatives; and where the vendor has parted with the whole of his property for building purposes, the purchaser of one lot can be prevented by any of the other purchasers from infringing the restrictions imposed on all alike, and can oblige the offender to replace, in the condition specified by the contract, any work that may have been done in violation of it. For instance, if a purchaser shall have covenanted or agreed to use a house as a private dwelling-house only, and shall subsequently turn it into a shop, the tribunals would, on application from one or more of the neighbours, at once summarily order the shop to be closed, and damages to be paid in case any detriment had been caused through the infringement of the covenant. Should any one of the purchasers be in the act of constructing a building of a kind opposed to the provisions of his contract, complaint may be laid before a judge by the other interested parties, or by one or more of them, and a simple order from the judge would be sufficient to stop the works until the matter could be submitted to a court, which, if an infringement of the contract were proved, could give directions for the removal of the building, and, in addition, grant damages.

Instead of being sold in building lots, land is sometimes let for a term of years upon condition that houses are built upon it; that an annual or other periodical rent is paid by the lessee; and that at the end of the term the houses shall become the property of the landlord. When land is so let, whether in town or country, the restrictions imposed on the lessee are, as in the case of the vendor, more or less those which the lessor may himself determine.

Like the vendor, the lessor has great latitude allowed him in such matters, so long as strict regard is paid to the requirements of the law in respect of whatever concerns public order and police regulations.

Where there is a written contract, the lessor, once the lessee having accepted any conditions inserted in the contract, can obtain redress in Court; and in the event of the lessee having dealt with the property in a way other than that specified in the covenant, the lease can be annulled. Moreover, in addition to damages, the landlord can claim payment of rent for the period during which his property may remain unlet.

Where the lease is a verbal one, the respective positions of landlord and tenant are determined by local usage, which also determines, in the case of verbal leases, the duration of such leases, as neither the landlord nor the tenant can terminate them except in accordance with the custom sanctioned in the particular locality in which the property is situated.

With respect to the length of the leases, when property is let for building purposes on condition that the houses at the end of the term become the property of the landlord, it is usual to calculate it on the probable income to be derived from the houses. The calculation is based on the principle that the lessee should not only obtain an annual income varying from 4 to 6 per cent. of the capital expended, but that the money laid out on the buildings should be redeemed.

It would be very difficult to fix an average for the duration of this kind of lease, much depending on the commercial, industrial, and social conditions of a particular locality.

In Paris there is land which has been let on good terms for the period of thirty years. Large dwelling-houses have been built upon it, which have realised excellent profits for the lessees, and are now doing the same for the landlords into whose hands the houses have come. As a general rule, however, building leases of this category exceed thirty years. They are not usually accompanied by any special stipulations, but very generally contain a "cancelling clause," enabling the landlord to annul the lease and to resume possession of his property in the event of the tenant failing to perform the conditions of the lease. Formerly it would appear that the application of this cancelling clause was not very strictly enforced; but at the present day the tribunals would give summary effect to its provisions, while empowered to deal

leniently with such tenants as have failed to carry out their contract from misfortune rather than from want of good faith.

These special building leases are unquestionably at the present time found to exist more frequently in the neighbourhood of towns than in the country.

Land is not sufficiently remunerative to make it worth while to rent it even on a long lease with the obligation to build on it.

## MANCHESTER ARCHITECTURAL ASSOCIATION.

AT the ordinary meeting held at the Old Town Hall, January 6, 1885, Mr. J. Spencer Hodgson in the chair, Mr. A. H. Davies Colley read a paper on "Stained Glass Windows." He described the different processes of colouring glass, together with the characteristics of the various periods. He considered the drawing should be as good as possible, and strong in outline, bringing out the true character of the design, the shading of figures to be avoided as much as possible, which should be entrusted to artists. Windows to the north should be warmer in tone than those to the south. A discussion followed, in which Messrs. Barker, Chadwick, Ward, Charleywood, and Hodgson took part.

## EARLY PERSIAN RUINS.

A LETTER from a correspondent of the *Times*, who accompanies the Afghan Frontier Commission, gives an account of some remarkable ruins which have been passed on the journey. Our route, he says, has been almost entirely along the right bank of the river Helmund, and has never before been traversed by a European traveller, although points on it were visited by Ferrier and by General Goldsmid's party. The two marches to Rudbar were along the winding bank of the river, enclosed between high sand hills, and generally concealed from view by thick tamarisk jungle. Here and there we came across alluvial bays formed by the receding sand hills and the river. One or two of these—Lundi, for example—supported small villages, but generally the country was deserted and barren. The ground, generally hard and gravelly, was often covered with bits of red pottery, which may or may not have been relics of ancient times, but it was not till we nearly reached Rudbar that there were any ruins worthy of notice. At Rudbar we encamped between two forts, which belong to two cousins of Ibrahim Khan, of Chakansur. The place has apparently dwindled in size and prosperity since General Pollock's visit. Here we come across the first evidence of Timur's savage invasion of Seistan in the ruined canal of Karshasp, the last of the Peshdadian kings, which used to water all southern Seistan. There are many other mementoes of Timur's visit in Seistan. The local tradition is that he was lamed for life by an arrow shot by a Seistani, hence the ruin and havoc he wrought.

The last few miles of our road to Rudbar lay through the ruins of canals, forts, and palaces, which have been described by General Pollock's companion, Dr. Bellew. These are supposed to mark the site of Caicobad, the capital of Cyrus's empire. One of the most interesting of these is the "Kila-i-Madar-i-Padshah"; *Anglice*, the palace of the king's mother, which is supposed to occupy the site of the residence of Cyrus's mother. I shall continually have to mention ruins, for the whole of the valley is covered with ruins of large cities, and if I describe the building I have referred to the description will suffice for all. They have a strong family resemblance, being all of mud—generally sun-dried—bricks, without a beam or a stone in the whole structure. The ruins seem to date from three distinct periods, beginning from the old Persian time when clay was used as the principal material. These are distinguished by their enormous dimensions and by the complete effacement of all their original features; they form large mounds of clay, which in some cases still show the general plan of the city; but the effacement is so complete that it is difficult to distinguish between artificial and natural mounds. Many were the references to our geologist, Mr. Griesbach, who, by the way, has taken some very successful photographs of the more remarkable ruins. The second period was apparently one when burnt brick was a comparatively common building material. The valley is covered with bits of red and yellow brick. It is difficult to say over what date the brick period extended; the only remains of buildings sufficiently well preserved to justify an inference seem to date from the sixteenth century. The third period is well marked by lofty mud walls in fairly good preservation. The palace of Cyrus's mother at Rudbar is, as I have said before, a good specimen of this period. It is a large quadrangular building, rising out of the sand which conceals the basement of its walls, with high towers at the angles and bastions flanking the walls. Inside is a hall of audience,

mosque, inner citadel, and several minor buildings. The whole is built of sun-dried bricks; there are no signs of wood having been used, but there are many baked bricks about, and the fact that the mud of which the walls are made contains bits of baked bricks leads to the conclusion that the structure stands on the site of an older building. It was probably destroyed by Nadir in his struggle with the Kaiani chiefs of Seistan. This is probably the date of the ruin of the other buildings and cities, though there are local traditions of a great flood having deluged the land.

The other more remarkable ruins are Kila-i-Futeh, Nadali, and Sar-o-tar. Some coins and ornaments, belonging principally to the early Caliphate, but also a few to the Greek, Sassanian, and Parthian periods were brought to our camp for sale by the Beloochees, who search the ruins after rain. Traces were also found of an early Hindoo occupation. What a field for an antiquarian with pickaxe and spade? Whatever may be the date and origin of these ruins, it is evident that the valley of the Helmund once supported a vast population dwelling in large, handsome cities—indeed a contrast to the present time when a few Beloochees living in huts of tamarisk are its sole occupants.

#### Semper's Theory of Evolution and its Practical Utility.

SIR,—It is impracticable to make a handbook for school-boys out of the "Principia" of Newton. Could we not go a step further and declare that, for any use we get out of it, Newton would have done as well never to have written his book? Such is the kind of logic a Mr. "Cui Bono" addresses in the year of our Lord 1885 to English architects, as a commentary on Professor Baldwin Brown's admirable letter on Semper's book, "Der Styl."

I recognise in "Cui Bono" an Englishman of the average kind, an enemy to theoretical speculation, who settles every question by asking whether it does pay. If it were not for the comforts and the profits which steam and electricity have provided for him, he would—before this century the "Cui Bonos" did—pronounce the study of the laws of nature mere waste of time, and men of science harmless fools like Vitruvius and Gottfried Semper.

To such men, and they are numerous, the proof of the pudding is the eating; it is the only proof they will listen to, for they are content to be wise after events. As I began the study of architecture under the direction of Semper, and have discussed his theories with all kinds of people ever since, my work must bear evidence of my master's training. The best answer, therefore, I can give to the objections of the "Cui Bonos" is to lay one of my works before them, and make an honest and full confession of the motives which decided every part of my design. I hope to prove thereby, firstly, that Semper's teaching leads to liberty, aye, to taking liberties with architecture undreamt by Semper himself; for as soon as the spirit of inquiry is abroad, those who have let it loose are no more masters to say, "So far shalt thou go and no further." Secondly, I will show that this glorious liberty due to Semper's teaching is far removed from anarchy, but that it submits to broad and subtle laws, which it obeys without feeling any constraint, because they appeal to our reason, not to authority of either past or present men. There is the same difference between Semper's teaching and the old cut-and-dry instructions of the Five Orders as there is between the Christian spirit of charity and the old Mosaic commandments of the Decalogue, or even better, the rough-and-ready laws of our police courts. With the one, a man has an interior monitor which penetrates in the most hidden corners of his conscience; with the others, he is kept from glaring acts of dishonesty; but he may yet be an arrant knave if he manages to keep within the four corners of the law, and smugly congratulate himself upon his righteousness. But, let us add, the simile holds good further. Just as man is still far removed from perfection after nearly nineteen centuries of Christianity, and that great moral differences exist amongst the faithful, so it is with art. The true principles may assist an artist to attain a higher level than he otherwise would have done, but they supply not either imagination or the delicacy of nerves with which artists are born, and, therefore, it does not follow that Semper's pupil will produce a better design than other people. It suffices for my purpose to have shown that my work has been materially affected by Semper's teaching, which is the test "Cui Bono" requires.

As the drawings take some time to prepare, allow me, Sir, to give rendezvous to Messrs. "Cui Bono" & Co. in a future number of *The Architect*.

LAWRENCE HARVEY, A.R.I.B.A.,  
Pupil of the late Professor Semper, Medallist of the  
Paris Ecole des Beaux-Arts.

#### Stuart and Revett's "Athens."

SIR,—It may interest your readers to know that the letters and proposals relating to the publication of Stuart and Revett's "Athens" are collected in a volume of the Camden Society's publications, entitled, "Letters of Eminent Men: edited by the late Sir H. Ellis. 1843."

The originals from which these letters are taken are among the additional manuscripts in the British Museum. The printed copies in the Camden publications are of wide and varied import. They are dated 1752, and are from a Mr. Hollis, who made the classical tour of Greece, and who wrote from Venice to urge on the publication of Stuart's "Athens."

The prospectus itself of these learned authors' is of great literary interest, enumerating in detail the illustrations, some of which could not have been carried out in the published volumes. It also has a list of the drawings made of the antiquities of Pola.

As the documentary history of great architectural works is often deficient, such memoranda as are here preserved enhance the value of so noted a book on classical art and architecture.

I am, Sir, yours, &c.,

January 8, 1885.

S. WAYLAND KERSHAW, F.S.A.

#### SANITARY WORKS.

**Sanitary Inspection.**—A meeting of the Association of Public Sanitary Inspectors was held at the offices of the Society, Adam Street, Adelphi, on Saturday evening. Mr. Jerram presided. Mr. E. C. Robins, F.S.A., read a paper on "The Growing Importance and Responsibility of Public Sanitary Inspectors." While commending the work of the Association, the author said the call for action on their part was the increasing interest of the public in sanitary matters. Some of the duties which sanitary inspectors were called upon to perform were evidence of the variety of technical knowledge and experience required of them. The present position of the sanitary inspector had not improved in proportion to its importance and responsibility, and it should be made more independent of the local authority. To entitle the sanitary inspector to the confidence of the public, educational classes should be organised by the Association, which should become a source of educational advancement to the younger members. To accord with the temper of the times, they should be willing to submit themselves for examination to some recognised sanitary authority, whose certificate of competency should have a distinct money value as a testimonial meritoriously acquired. The secretary (Mr. Samuel C. Legg) opened the discussion which followed. It was generally agreed that sanitary inspectors should have large practical experience, and that educational classes for young members should be formed. Mr. Jerram intimated that the council were in communication with the Sanitary Institute on the question of educational classes and examinations, with a view to joint and therefore more effective action. A vote of thanks to Mr. Robins concluded the meeting.

#### REVIEWS.

**TECHNOLOGICAL DICTIONARY IN THE ENGLISH AND GERMAN LANGUAGES.** Edited by GUSTAV EGER. 2 vols. Brunswick: Vieweg & Son. London: Trübner & Co.

The language of the French will probably retain its old influence as time runs on, but since German is the key to treasures of thought and is the speech of a race that seems destined to rival the English in colonising power, a knowledge of it is becoming indispensable. At the beginning of the century it was hardly known beyond the limits of the states that constituted what was called Germany; now it is to be heard in almost all lands. German merchants and manufacturers are opening foreign markets, and one of the best proofs of their rivalry with their English competitors is seen in the massive volumes which have been prepared by a staff of experts under the direction of Professor Eger. So much space is needed, because in commercial intercourse things have to be described which would be considered unnecessary in an ordinary dictionary. It may suggest the number of terms which are comprised, when it is said that under the head of "iron" there are about seven columns of words. German is unrivalled among modern languages for flexibility. There is no difficulty about introducing new words and new constructions whenever they become necessary, and hence German translations of foreign works are unrivalled for fidelity, while, on the other hand, it is difficult to represent a German book in the words of another language. The ease with which words are formed makes a complete general dictionary almost an impossibility. In a very large one edited by a medical professor which is before us, we find no word for Daltonism, or colour-blindness (in Herr Eger's book we have the expressive "Farbenblindheit"),

and the clear "Lichtbild," and hundreds of similar words are omitted. Errors are also made, such as giving "Rechantisch" for abacus, when it is only to the counters used in schools that the German word applies. Herr Eger comprehends every technicality that is likely to be required in commercial correspondence, or in the speech of business men. Thus, a Chubb's lock is included, becoming "das Chubschloss," and it is described, "eine Art Sicherheitsschloss, nach seinem Erfinder benannt." The dictionary is clearly printed in legible type, and many readers will probably be more pleased at finding the old German letters have been supplanted by Roman. The volumes, so far as we have been able to test them, are marked by the strictest accuracy, and they will be invaluable in business houses. A work of this kind suggests the relation between English building terms and their equivalents in German and French. It would seem that there is a nearer affinity to the latter. Thus we find that, even in spelling, there are several words which are identical in French and English. Among them are structure, plan, construction, arcade, base, balustrade, joint, vestibule. Then there are others which are so close that they are readily identified, such as matériaux, brique, mortier, ciment, plâtre, gypse, stuc, voûte, pilastre, colonne, chapiteau, corniche, rampe, mortaise, charpente, sommier, latte, gouttière, linteau, seuil, &c. If we take the words which are considered essentially Saxon, and compare them with German, they are suggestive of a good many transformations since the Teutonic race left its northern home. The following will serve as examples:—Building ("Bauen"), shed ("Schuppen"), wall ("Mauern"), door ("Thür"), roof ("Dach"), floor ("Fussboden"). Hammer denotes the same thing in both languages, but who could recognise kinship between saw, plane, chisel, adze in the corresponding German words?

### CHURCH BUILDING AND RESTORATION.

**Winslow.**—The church of St. Lawrence has been reopened after restoration carried out by Mr. G. Cooper, builder, Aylesbury, under the direction of Mr. J. Oldrid Scott. The gas pendants and standards were supplied by Messrs. Barrett, Birmingham; the wrought-iron work by Mr. Skidmore, of Coventry. An oak reredos has been erected by Messrs. Farmer & Brindley, of London. The font is of Caen stone, with Purbeck marble shafts, executed by Mr. H. Terry, London, the cost of which has been contributed by the children of the parish.

**Wylam.**—The foundation-stone of a church has been laid at Wylam, in the parish of Ovingham. The church has been designed by Mr. R. J. Johnson, of Newcastle, and will be constructed of stone, and of late Gothic style. It will consist of nave and chancel, organ chamber, vestry, short aisle with nave and tower on the south side, and an open oak porch. Accommodation will be afforded for about 250. The builder is Mr. Walter Scott, of Sunderland.

**Glencorse, N.E.**—The foundation-stone of a church for the parish of Glencorse, designed by Messrs. Wardrop, Anderson & Browne, architects, Edinburgh, has been laid. The ground plan shows a central nave, having upon one side, separated by an arcade of three bays, a long aisle, and on the other, separated by an arcade of two bays, a double transept. The estimated cost of the building is 2,700*l*. The builders are Messrs. J. & J. Turner, Juniper Green, Edinburgh. The clerk of works, Mr. Basil Slater.

### GENERAL.

**The Collection of Pictures** formed by M. van Lerijs, and principally composed of works by Antwerp masters, will be sold at Antwerp on February 19 and following days.

**Mr. Frank Holl, R.A.**, is painting a portrait of Mr. Wilson Barrett in the character of Hamlet. He has also been commissioned to paint the portrait of Mr. Fowler, the late Lord Mayor.

**The Institute of Painters in Oil Colours** on Wednesday evening elected the following artists members, viz., Mr. J. W. Waterhouse, R.I., Mr. F. D. Millet, and Mr. C. Napier-Hemy, R.I.

**Mr. John Kinross** will read a paper on "The Study and Progress of Architecture" at the meeting of the Edinburgh Architectural Association on Monday next.

**Two Large Hospitals** are about to be constructed in Tunis. The funds for the civil building will be derived out of the proceeds of the Tunisian lottery, which was well supported in France.

**The Manchester Town Council** on Wednesday adopted a recommendation of the Waterworks Committee to begin the works necessary for bringing the water of Thirlmere Lake to Manchester, powers for which were obtained five years ago.

**Herr Fritz Kaulbach**, the painter, has been ennobled by the King of Bavaria. He is the son of the famous artist, Wilhelm Kaulbach.

**Mr. J. D. Linton** has nearly completed his picture of the wedding of the late Duke of Albany.

**The Art Loan Exhibition**, opened at Brighton last October, closed on Saturday last, without bringing any profits in aid of the local art school.

**The Sidney Cooper School of Art**, Canterbury, will be reopened on the 22nd inst. Sir Frederick Leighton, P.R.A., and Mr. Millais, R.A., have been invited for the occasion.

**Mr. George Scharf**, Keeper of the National Portrait Gallery, is to be appointed a Companion of the Bath.

**A Memorial Pulpit** of marble and alabaster, designed by Mr. J. A. Chatwin, of Birmingham, and executed by Mr. Bridgeman, of Lichfield, has been placed in Aston parish church.

**The Wimborne Minster Restoration Committee** report that the debt for the work on the towers has been cleared off, and about 150*l*. received towards the fund for the restoration of the transepts.

**Mr. Petrie** has discovered extensive remains at a spot seven miles from Jeh El Barood, on the line of the railway from Cairo to Alexandria, and has identified them as marking the site of the ancient Naucratis mentioned by Herodotus. He has also proved that this city did not stand, as stated by the historian, upon the Nile, but upon the old Canal.

**The Kilmarnock Art Union** has sold tickets amounting to 385*l*. 17*s*. 6*d*., out of which 360*l*. has been expended on prizes.

**On Wednesday** a cheque for 11,720*l*. was sent to the Liverpool Corporation from Sir A. B. Walker, to cover the cost of the extension of the Walker Art Gallery.

**The Old Parish Church, Crewkerne**, is to be restored, and the works contemplated are estimated to cost 3,000*l*.

**A Carved Oak Reredos** is to be placed in St. John's Church, Blackpool. The carving will be done by Mr. John Roddis, of Birmingham, from the designs of Messrs. Garlick & Sykes, of Blackpool.

**The French Minister of the Interior** has decided to have a convalescent home for workmen constructed at Vincennes, for the benefit of men leaving the asylum.

**The Reredos in Winchester Cathedral** is to be restored, at an estimated cost of 4,000*l*., as a memorial of the late Archdeacon Jacob.

**M. Lenders**, who represented Belgium at the Health Exhibition at South Kensington, has been nominated a Chevalier of the Order of Leopold.

**The "Garden of the Hesperides,"** by Rubens, left England within the past few days, its destination being a well-known collection at Paris.

**The Edinburgh Dean of Guild** has inflicted a fine of 3*l*., and expenses, on a firm of builders for commencing to build a dwelling-house in Balcarres Street, without a warrant from the court.

**M. Fichet**, a contractor of St. Gilles, has obtained the first prize of 500,000 frs. in the Arts Décoratifs lottery.

**A Large Portion of Norfolk Street, Werneth**, gave way on Tuesday night, and sank into what appears to have been an old pit-shaft. The collieries thus brought to light have been disused for half a century.

**The Local Tait Memorial** at Canterbury will for the present be confined to the erection of the sedilia in the cathedral. The scheme for a reredos has been abandoned, owing to a difference of opinion as to removing or retaining the eastern screen.

**Messrs. E. & H. Martin** have commenced business as auctioneers and estate agents at 93 Gracechurch Street, London, E.C.; also at Grays, Essex, and Southend-on-Sea.

**Messrs. C. Isler & Co.**, of 88 Southwark Street, London, S.E., have received orders to deepen the existing well for the supply of the town of Andover, by means of a 15-inch artesian bored tube well.

**The Tamworth Arms Hotel**, Moor Street, Birmingham, has recently been entirely rebuilt from the designs of Mr. Oliver Essex, A.R.I.B.A., at a cost of about 3,500*l*. Mr. W. Robinson, of Birmingham, was the builder.

**The Guardians** of the Billesdon Union, acting as the sanitary authority of the district, met on Monday, the 5th inst., to appoint an engineer to advise them upon a scheme of drainage for the districts of Humberstone and Evington, suburbs of Leicester. This important matter has for some time occupied the attention of the local authorities. The guardians, after due consideration, have appointed Mr. J. B. Everard, Assoc. Mem. I.C.E., advising engineer.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JANUARY 10, 1885.

## AUCTION SUMMARY.

For the Week ending January 17.

MONDAY, 12th, and following days:—

*Messrs. Furber, Price & Furber.*—Contents of Alexandra Palace and Grounds.

WEDNESDAY, 14th:—

*Messrs. Toplis & Harding.*—Building Estate, Lewisham.

FRIDAY, 16th:—

*Messrs. Baker & Sons.*—Building Land, City Road.

*Messrs. Frank Lewis & Co.*—Waterside Premises and Freehold Land.

## APPOINTMENTS VACANT.

SHANGHAI.—The Shanghai Gas Company require an Assistant Engineer. Salary to commence at 350*l.* per annum, with additional allowances. Free passage out and home. Mr. Geo. J. Yeo, Engineer and Secretary, 10 Dalton Chambers, 41 John Dalton Street, Manchester.

SODBURY.—Jan. 12.—Applications are required for the Appointment of a Surveyor. Salary 300*l.* per annum. Mr. J. Trenfield, Clerk to the Highway Board, Chipping Sodbury.

WEST BROXTON.—Jan. 13.—Applications are required for the Appointment of a District Surveyor to the Highway Board. Applications to be sent to the Clerk's Office, Crypt Chambers, Chester.

## COMPETITIONS OPEN.

CHELSEA.—Feb. 25.—Plans are invited for Additions to the Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, Clerk of the Vestry, King's Road, Chelsea.

CROYDON.—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100*l.*, 30*l.*, and 25*l.* for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

KING'S NORTON.—Jan. 15.—Plans for the Erection of Four Cottage Homes upon Lands situate at Shenley Fields are required. Mr. Ralph Docker, Clerk of King's Norton Union, Colmore Row, Birmingham.

KING'S NORTON.—Jan. 15.—Plans are invited for the Erection of a Laundry, at the Workhouse, Selly Oak. Mr. Ralph Docker, 57 Colmore Row, Birmingham.

LONDON.—Jan. 15.—Architects experienced in the designing and erection of factories or breweries, and desirous of taking part in a limited competition, are invited to send a statement of the nature and extent of their experience in such work to Y. Z., 1,245, Advertising Offices, 167 Fleet Street. The proprietor proposes to select not fewer than six or more than twelve competitors. A member of the Council of the Institute of Architects has undertaken to assist him in the choice of names, the preparation of the instructions and conditions of competition, and the selection of the designs.

LONGTON.—Feb. 20.—The Longton School Board are about to erect two sets of schools at Normacott and Florence, each to accommodate 700 scholars (220 boys, 220 girls, and 260 infants), and invite architects in the Potteries and Newcastle to send in designs and estimates. Mr. Geo. C. Kent, Clerk to the School Board, Longton.

WINDSOR.—Feb. 28.—The Town Council of New Windsor invite designs for a panel of tapestry to be fixed in the Guildhall. Three prize-winners will be invited to compete for the cartoon from which the panel of tapestry will be woven. The Town Clerk, 4 Park Street, Windsor. Competitors must be resident within five miles of the Guildhall, Windsor.

## CONTRACTS OPEN.

ASHTON-ON-MERSEY.—Jan. 27.—For Leveling, Paving, Metalling, and Channelling Streets. Mr. A. McKenzie, Surveyor, Broomfield Road, Hale, near Altrincham.

BALBY WITH HEXTHORPE.—Jan. 14.—For Furnishing Desks and other Apparatus for Board School. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

BARNLEY.—Jan. 13.—For Building Warehouse and other Works, for the British Co-operative Society. Messrs. Wade & Turner, Architects, 10 Pitt Street, Barnley.

BARNLEY.—Jan. 16.—For Building Offices, Reading Room, Lecture Hall, &c. Mr. William Senior, Architect, 3 Regent Street, Barnley.

BEDFORD.—Feb. 24.—For Plans and Specifications and Execution of Works in connection with Sewage Pumping at Outfall Works. Mr. J. Lund, Borough Surveyor, Corn Exchange, Bedford.

BEXHILL.—Jan. 15.—For Enlarging and Part Rebuilding Church of St. Mark. Messrs. Riches & Esam, Architects, Station Road, Bexhill.

BIRKENHEAD.—Feb. 5.—For Supply and Erection of Two Pumping Engines, with Pumps and Steam Boiler, at Spring Hill Waterworks. Mr. W. A. Richardson, Water Engineer, 50 Hamilton Square, Birkenhead.

BLACKBURN.—Jan. 10.—For Supply of Material, Labour, Tools, &c., for the year, including Paving Setts, Sidestones, Channel Stones, and Circular Curbs, Flags, Ashlar Wall Stone and Landings, Stone for Underbedding and Hand-pitching, Granite (Macadam and Circular Curbs), Limestone (Cob and Broken) and Lime, Cement, Gravel and Sand, Bricks and Clay, Earthenware Pipes, Wrought Iron (Bar, Sheet, and Hoop) and Steel. Mr. J. B. McCallum, Borough and Water Engineer, Municipal Offices, Blackburn.

BLACKPOOL.—Jan. 14.—For Constructing and Laying Tramways along the Parade. Mr. T. Sunderland, Borough Surveyor, Town Hall, Blackpool.

BLACKPOOL.—Jan. 14.—For the Engines and Boilers required for the Electric Tramway Company. Mr. M. Holroyd Smith, Consulting and Electrical Engineer, Halifax.

BURNLEY.—Jan. 13.—For Building Business Premises for Messrs. Bayne & Son. Messrs. W. Waddington & Son, Architects, Grimshawe Street, Burnley.

CARLISLE.—Jan. 13.—For Rebuilding House and Shop in Botchergate. Mr. James Leslie, Architect, 27A English Street, Carlisle.

CLAINES.—Jan. 21.—For Supplying and Laying Cast-iron Pipes and Water Mains, Fixing Valves, Hydrants, &c. Mr. A. H. Parker, Surveyor to the Claines Local Board, 5 Foregate Street, Worcester.

CLAREMORRIS.—Jan. 14.—For Building Dispensary House and Medical Officer's Residence at Ballandine. Mr. Glover, C.E., County Surveyor, Claremorris.

COLCHESTER.—Jan. 10.—For Alterations and Additions to Offices of the Equitable Insurance Society. Mr. F. Evelyn Morris, Architect, West Stockwell Street, Colchester.

COLCHESTER.—Jan. 15.—For Building Shop in Long Wyre Street. Mr. J. F. Goodey, Architect, 2 Victoria Chambers, West Stockwell Street, Colchester.

CROYDON.—Jan. 10.—For Supply of Furniture, &c., for the Guardians. Mr. Alfred G. Blake, Clerk, 15 George Street, Croydon.

EAST RETFORD.—Jan. 23.—For Flagging and Blue Brick Paving Works in Bridge Gate, Moorgate and Grove Street. Mr. J. D. Kennedy, Borough Surveyor, East Retford.

EDINBURGH.—Jan. 15.—For Works in Construction of New Culvert in connection with proposed Diversion of a portion of the Lochrin Outlet Sewer near Haymarket Station. The Burgh Engineer, 1 Parliament Square, Edinburgh.

EXBOURNE.—Jan. 10.—For Restoration of Chancel, Building Organ Chamber and Vestry to Parish Church. Mr. R. Medley Fulford, Architect, The Close, Exeter.

EXETER.—Jan. 15.—For Forming Roads, Sewers, and Footpaths on Elmside Building Estate. Messrs. Packham & Croote, Surveyors, 93 Paris Street, Exeter.

FINCHLEY.—Jan. 19.—For Supply of Guernsey and other Hand-broken Granite (2,300 tons). Mr. G. W. Brumell, Surveyor to the Local Board, Church End, Finchley.

GAINSBOROUGH.—Jan. 14.—For Sinking Bore Hole for Water Supply of Town. Mr. C. Greenhaigh, Surveyor, Chapel Staithe Offices, Gainsborough.

GOOLE.—Jan. 19.—For Metalling, Levelling, Paving, Flagging, Channelling, and Draining certain Streets. Mr. E. C. B. Tudor, C.E., Local Board Office, Market Hall Chambers, Goole.

GLASGOW.—Jan. 12.—For Supply and Erection of a Malleable-iron Girder Bridge, to carry the Garvel Dock Lines over road from Greenock to Port Glasgow. The Engineer's Office, St. Enoch Station, Glasgow.

GREENWICH.—Jan. 12.—For Relining First-class Swimming Bath (Bricks and Tiles). Mr. Alfred Budds, Clerk to the Commissioners of Public Baths and Washhouses, Greenwich.

**HARDINGSTONE.**—Jan. 19.—For Construction of Sewers, Tanks, Buildings, and other Works in Connection, St. James's End. Messrs. Ingman & Sons, Surveyors, Hazlewood Road, Northampton.

**HECKMONDWIKE.**—Jan. 13.—For Extensions to Brunswick Mill. Mr. Samuel Wood, Architect, Heckmondwike.

**HEREFORD.**—Jan. 12.—For Supply of Cast-iron (Turned and Bored) Gas Pipes and Irregular Castings. Mr. William Parlbay, Gas Engineer and Manager, Corporation Gasworks, Hereford.

**HERNE BAY.**—Jan. 13.—For Building Board Schools. Mr. Thomas W. Collard, Clerk to the Herne School Board. The Institute, Herne Bay.

**HORSFORTH.**—For Purchase and Removal of Horsforth Old Church. Rev. T. R. W. Pearson, M.A., the Vicarage, Horsforth.

**INDIA.**—Jan. 13.—For Supply of Ironwork for Well Kerbs. The Director-General of Stores, India Office, Westminster, S.W.

**INDIAN RAILWAYS.**—Jan. 13.—For Supplying Ironwork for Waggon and Steel Fishplates. Mr. A. Abercrombie Jopps, Director-General of Stores, India Office, Westminster, S.W.

**LEITH, N.B.**—Jan. 10.—For Painting and Making Additions to Victoria School, Newhaven. Mr. George Craig, Architect, 85 Constitution Street, Leith.

**LEEDS.**—Jan. 12.—For New Boiler, 50 horsepower. Mr. Alf Cooke, Crown Point Printing Works, Leeds.

[Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.]

EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY,

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH  
Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged **A**; this is attached to a corresponding flange **B**, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the india-rubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMER'S SQUARE, N.W.

## SALES BY AUCTION.

Alexandra Palace.—To Public Caterers, Restaurant and Hotel Keepers, Theatrical and Music-hall Proprietors, and others.

**MESSRS. FURBER, PRICE & FURBER** are favoured with instructions from the Directors of the London Financial Association to **SELL BY PUBLIC AUCTION**, at the Alexandra Palace, Wood Green, on Monday, January 13, and following days, at Ten for Eleven o'clock each day, the **FIRST PORTION OF THE CONTENTS OF THE PALACE**, comprising the capital office furniture and fittings of secretary's, manager's, clerks', and general offices in Spanish mahogany and light oak; three large fireproof iron repositories, the furniture of the public and private dining, lecture, and reading-rooms, saloons, buffets, of mahogany dining and other tables, sets of walnut wood and mahogany chairs, pedestal sideboards, large size Brussels carpets, noble plate chimney-glasses, seven full-compass pianofortes by the eminent makers—Messrs. Erard, Messrs. Holderness & Ascherberg, in mahogany and rosewood cases, a 14-stop harmonium by Messrs. Holderness, kettle and other drums, the contents of the central and great halls, bazaar, exhibitors' department, concert-room, corridors, skittle saloon, about 10,000 chairs, 250 garden-seats, pedestals, marble vases, &c.; a large assortment of plated articles in meat and other dishes, soup tureens, and following, most covers, about 300 dozen table-plate, cutlery, a large stock of table and other glass, china dinner and dessert services, table linen, and a quantity of culinary utensils, furniture, &c., of the servants' offices, cellars.—May be viewed on the Friday and Saturday prior to the Sale, by catalogues only (not each), to be obtained of Messrs. Marbury, Stewart & Co., Solicitors, 57 Coleman Street; of C. J. Hayter, Esq., at the Office of the London Financial Association, 1 Draper's Gardens, Throgmorton Avenue, E.C.; at the Wood Green Entrance Lodge; at Messrs. Furber, Price, & Furber's Office, at the Palace; and at the Auction and Estate Offices, Warwick Court, Gray's Inn, W.C.

Alexandra Palace.—To Public Caterers, Builders, Music Hall, Racecourse, and Circus Proprietors, Engineers, Printers, Florists, and others.

**MESSRS. FURBER, PRICE & FURBER** are favoured with instructions from the Directors of the London Financial Association to **SELL BY PUBLIC AUCTION**, at the ALEXANDRA PALACE, Wood Green, on Tuesday, January 14, and following days, at Ten for Eleven o'clock each day, the **SECOND PORTION OF THE PALACE AND GROUNDS**, including the contents of the great hall, bazaar, exhibition department, and corridors, of statuary, pedestals, ornamental garden-seats, a valuable cosmorama, vases, gongs, musical instruments, a model of Moorish and Turkish dwellings with life-size figures, a large magic lantern, a valuable music library, the printing plant of two gas engines, six printing presses, two cutting machines, galleys, iron chases, about a ton of type, and the usual materials, two nearly new 10 horse-power steam-engines, several working model steam-engines, models, capital turning lathes, engineers' tools, anvil, bellows, the contents of carpenters', painters', and smiths' shops, a large stock of miscellaneous stores, garden implements of iron rollers, lawn mowers, &c. The outdoor effects comprise numerous games, erection of swings, turn-stiles, ticket-boxes, 40 pleasure-boats, a large variety of carriages, carriages, carriages, four nearly new sleighs, erections of sheds, workshops, &c., a quantity of useful materials, iron fencing, notice-boards, and a very large collection of useful effects.—May be viewed by catalogues (only 6d. each) two days prior to morning of sale, to be obtained of Messrs. Marbury, Stewart & Co., Solicitors, 57 Coleman Street; of C. J. Hayter, Esq., at the Office of the London Financial Association, 1 Draper's Gardens, Throgmorton Avenue, E.C.; at the Wood Green Entrance Lodge; at Messrs. Furber, Price & Furber's Office at the Palace; and at the Auction and Estate Offices, Warwick Court, Gray's Inn, W.C.

Lewisham, Kent, a short distance from Catford Bridge Station on the Mid-Kent Line, and about a mile from the Junction Station.—A valuable Freehold Residential and Building Estate, containing about 13 acres, with extensive frontages to the High Road. With Possession.

**MESSRS. TOPLIS & HARDING** are instructed by the Executors of the late E. M. Hubback, Esq., to **SELL BY AUCTION**, at the Mart, E.C., on Wednesday, January 14, at Two punctually, in Three Lots, a valuable **FREEHOLD RESIDENTIAL AND BUILDING ESTATE**, situated on the High Road, Lewisham, and known as "Rosenthal." It comprises a comfortable old-fashioned Family Residence, in excellent repair throughout (a large sum having been recently expended in repairs and decorations), containing seven bedchambers, dressing-room, fitted bath-room, entrance hall, handsome drawing-room, large dining-room, lofty billiard-room, double morning-room, leading into a conservatory, and ample domestic accommodation; a capital detached stabling, comprising four loose boxes, coach and chaise houses, harness-room, men's rooms, &c.; finely-terminated pleasure grounds, with large tennis lawn, greenhouses, vineery, forcing ground, and ornamental water, well-stocked kitchen and fruit garden, small farmery, and in the rear several enclosures of meadow land, and two cottages in George Lane, the whole having a frontage to the high road of about 570 feet, and containing about 10 acres immediately available for building operations. On the other side of the high road is a plot of freehold building land of about two acres, with wide frontage thereto and to a side road.—The property may be viewed by cards only (to be had of the Auctioneers), and particulars had of Messrs. Stones, Morris & Stone, Solicitors, 5 Finsbury Circus; at the Mart; and of Messrs. Toplis & Harding, 16 St. Paul's Churchyard, E.C.

UPPER THAMES STREET, E.C.—To Builders, Marble Masons, and Others.—Absolute Sale of Marble Chimney-pieces, &c. (in consequence of the Premises having to be given up at Lady Day).

**MESSRS. HORNE, SON & EVERSFIELD** are instructed by Mr. George Mitchell to **SELL BY AUCTION**, on the Premises, No. 168 Upper Thames Street, E.C., on Tuesday, January 20, and following days, at Twelve punctually, on each day, the whole of the valuable **STOCK** of very handsome **CHIMNEYPIECES** and **FENDERS** in Statuary, Sicilian, Blanc, P. Sienna, Brun Breche, Italian Grotto, Bardilla, Black, Rouge Royal, St. Ann's, &c., and other Marbles, in every variety of design suitable for building of every class of house; a large selection of kitchen ranges and tile grates by the best makers; and a well-assorted stock of 3-inch and 1-inch tiles, &c.—May be viewed one week prior to Sale, and catalogues had on the Premises; also at No. 168 Brompton Road, S.W.; and of Messrs. Horne, Son, & Eversfield, 17 Great George Street, S.W., and 80 Fore Street, E.C.

To Builders and Others.—Hendon.—Valuable Freehold Land with buildings thereon, comprising two cottages, barn, and stable, producing, when all are let, £38 4s. per annum, less some small outgoings. Well situated in the above valuable locality, in main road at the corner of Collin Deep Lane, the Burroughs, and near station.

**INMAN & CO.** will **OFFER BY AUCTION**, at the Mart, Tokenhouse Yard, E.C., on Monday, January 19, at One o'clock, the above valuable **PROPERTY**, on the usual conditions of sale at the Mart; of Messrs. Smith, Stanning & Croft, Solicitors, 70A Aldermanbury; and at the Auction Offices, 126 Maiden Lane.

**BERMONDSEY WALL POTTERIES**, fitted with Kilns, Plant, and Machinery, with possession, together with the Goodwill of the old-established Business for the Manufacture of Stoneware Drainpipes, Chimney-pots, &c.

**MESSRS. FULLER, HORSEY, SONS & CASSELL**, are instructed by the Executors of the late Mr. Henry Millicham to **SELL BY AUCTION**, at the Mart, Tokenhouse Yard, London, E.C., on Wednesday, January 21, 1885, at One precisely, in One Lot, the valuable **PREMISES**, known as the **Bermundsey Wall Potteries**, situate No. 98 Bermundsey Wall, occupying an area of about 21,500 square feet, part freehold and part leasehold. The freehold portion has a frontage to Salisbury Street, and comprises a substantial brick-built factory of three floors, with kiln, covered store adjoining, and large yard. The remainder of the premises consists of a spacious factory, with two kilns, and two pairs edge-runners, steam-engine and boiler-house, with horizontal steam-engine and boiler, chimney-shaft, stabling, dwelling-house, and yard, held for an unexpired term of about forty-one years, at a rental of £210 per annum; also a factory adjoining, with two kilns and dwelling-house, held for an unexpired term of about two years, at a rental of £40 per annum.—May be viewed by orders, to be obtained at the Auctioneers' Offices, and particulars had of A. Calkin Lewis, Esq., Solicitor, 7 Fumival's Inn, E.C.; Samuel Dyer, Esq., Esq., Chartered Accountant, 3 King Street, Chesham, E.C.; at the Mart; and of Messrs. Fuller, Horsey, Sons, & Cassell, No. 11 Billiter Square, E.C.

On Friday next.

**CITY ROAD**.—By order of Mr. G. Tatum, the Mortgagee, at a low reserve.—Valuable Freehold Building Site.

**MESSRS. BAKER & SONS** will **SELL BY AUCTION**, at the Mart, Tokenhouse Yard, Bank, E.C., on Friday next, Jan. 16, 1885, at One o'clock precisely, under previously sold privately, in One Lot, a grand **FREEHOLD BUILDING SITE**, most eligibly situate on the south side of the City Road, immediately opposite St. Luke's Vestry-hall and the Eagle Tavern. It was formerly known as Nos. 228, 229, 230, 231, 234, and 236 City Road, with a frontage thereto of 98 feet, an average depth of 150 feet, and occupying an area of about 10,000 feet super. Vacant freehold land in this important and crowded neighbourhood rarely comes into the market; this site, therefore, offers an excellent opportunity to the capitalist, builder, or speculator, for the erection of shops, warehouses, or artisans' dwellings, or, in fact, for any building purposes which require a commanding position in a busy thoroughfare.—Particulars, plan, and conditions of sale may be had at the Mart; of Messrs. Alfred Jones & Co., Solicitors, 33 John Street, Bedford Row, W.C.; and of the Auctioneers, 11 Queen Victoria Street, E.C.

Leytonstone, close to the Station on the Great Eastern Railway.

**MR. GEORGE B. SMALLPEICE** has received instructions to **SELL BY AUCTION**, at the Mart, Tokenhouse Yard, Bank of England, on Thursday, January 23, at Two punctually, **FOUR ELEGANT PLOTS OF FREEHOLD BUILDING LAND**, situate in the Fairlop, Fillebrook, and Bulwer Roads, with frontage amounting to 550 feet. Also the Freehold Residence in Fairlop Road, known as Albany Villa. The land is exceedingly well placed, within 20 minutes' ride of the Metropolis, to which a constant and regular service of trains; it is well adapted for the erection of villas of a superior description, and which, from their easy access, would readily command a desirable class of tenants. The residence may be viewed with the permission of the occupier.—Particulars may be obtained of C. B. Cooper, Esq., Solicitor, 40 Bedford Row, W.C.; at the Mart; and of George B. Smallpeice, Surveyor and Auctioneer, 9 and 10 Tokenhouse Yard, Lotbury, E.C.

City of London, Paternoster Row.—A valuable Freehold Building Site of about 1,770 square feet.

**MR. ROBERT REID** will **LET BY AUCTION**, at the Mart, on Friday, January 23, at Two precisely, on building lease for a term of 80 years, a valuable **FREEHOLD BUILDING SITE**, being No. 7 Paternoster Row, and on the north side thereof, seven doors from St. Paul's Churchyard, occupying an area of about 1,770 square feet, with a frontage of 22 feet to Paternoster Row, in the heart of the publishing trade, and for many years occupied by the delegates of the University Press, Oxford. Particulars, with plan, may be obtained of Messrs. Woolleys, Beardsley & Bosworth, Solicitors, Loughborough; at the Mart, E.C.; and of Mr. Robert Reid, 51 Great Marlborough Street, W.

In the High Court of Justice, Chancery Division: "Bowling v. Dubois."—Hendon and Kilburn.

**MR. ROBERT REID** will **SELL**, at the Mart, on Friday, January 23, at Two precisely, in Two Lots, Plot of **FREEHOLD BUILDING LAND**, having a frontage of 40 feet and a depth of 120 feet in Daw's Lane Mill Hill, Hendon, five minutes' walk from Mill Hill Station, on the Midland Railway; and a Leasehold House, No. 5 Lincoln Terrace, Willesden Lane, Kilburn. Held by lease for 75 years unexpired, at a rental of £10 per annum.—Particulars may be obtained of Messrs. Cree & Son, solicitors, No. 13 Gray's Inn Square, W.C.; also of Messrs. Dubois, Reid, & Williams, solicitors, No. 3, Pancras Lane, E.C.; at the Mart, E.C.; and of Mr. Robert Reid, 51 Great Marlborough Street, W.

Holloway.—Small Leasehold Investment.

**MESSRS. FRANK LEWIS & CO.** will **SELL BY AUCTION**, at the Mart, on Friday, January 16, at Two precisely, in Two Lots, the valuable long Leasehold Property, known as No. 94 Narrow Street, Limehouse, upon which are two dwelling-houses and offices, with covered barge-building premises and wharf in rear, all erected by the present lessees, with frontage on the Thames of 36 feet, and may be adapted for a ground-rent of £47 per annum, and of the rental value of £42 per annum.—Particulars may be had of Messrs. Rye and Eyre, solicitors, 16 Golden Square, W.; and of the Auctioneers, 95 Gresham Street, E.C.

By Order of Mortgagees.—Waterside Premises, Limehouse.—Long Leasehold Barge-Builder's Premises, and valuable Piece of Freehold Land.

**MESSRS. FRANK LEWIS & CO.** will **SELL BY AUCTION**, at the Mart, on Friday, Jan. 16, at Two precisely, in Two Lots, the valuable long Leasehold Property, known as No. 94 Narrow Street, Limehouse, upon which are two dwelling-houses and offices, with covered barge-building premises and wharf in rear, all erected by the present lessees, with frontage on the Thames of 36 feet, and may be adapted for a ground-rent of £47 per annum, and of the rental value of £42 per annum. Also a valuable piece of Freehold Land, with the buildings thereon, consisting of sail loft, stores, and smithy, situated on the north side of Ropemakers' Fields, Limehouse, having a frontage of about 50 feet by a depth of about 136 feet, adapted for the erection of warehouses or dwellings.—Particulars, with plan, may be had at the Mart; of Messrs. Smith, Stanning & Croft, solicitors, 70A Aldermanbury, E.C.; of F. S. Stanning, Esq., solicitor, Maidstone; and of the Auctioneers, 95 Gresham Street, E.C.

Preliminary Announcement.—To Speculators, Charitable or Religious Institutions, and others seeking extensive Premises and Buildings, with large Concert Hall, Lecture Room, or Ball Room, &c., within easy distance of the metropolis.

**MESSRS. WM. & F. HOUGHTON** are favoured with instructions to **SELL BY AUCTION**, at an early date (unless an acceptable offer be made in the meantime), the valuable **FREEHOLD PROPERTY** known as the **Athenaeum, Oakleigh Park**, near the populous and important town of Barnet, Herts, situate about five minutes' walk from Oakleigh Park Station, on the main line of the Great Northern Railway, and seven minutes from the Totteridge and Whetstone Station on the High Barnet branch. It consists of a lofty and well-constructed hall, 60 feet by 30 feet, capable of seating over 400 people, with patent sliding stage. Connected with the stage and hall are retiring-rooms with lavatory, kitchen, reception-rooms, and other conveniences. The approach is by a carriage sweep beneath a porte cochère, opening to entrance hall and lobby. The floor having been expressly laid for dancing renders the hall specially suitable as a ball-room, the hall being licensed for music and dancing. In connection with the before-named is a well-lighted billiard-room, library, lavatory, and a four-roomed cottage for caretaker. There are extensive and level tennis lawns in the well-shrubbed grounds which surround the buildings. The latter, together with the billiard-room and library, could readily be let off as a club.—Full particulars, with plans, of Messrs. Houghtons & Byfield, Solicitors, 88 Finchchurch Street, E.C., and of Messrs. Wm. & F. Houghton, 61 Old Broad Street, London, E.C.

Sales for the Year 1885.

**MESSRS. DEBENHAM, TEWSON, FARMER & BRIDGEWATER** beg to announce that their **SALES OF LAND AND ESTATE, INVESTMENTS, Town, Suburban, and Country Houses, Business Premises, Building Land, Ground Rents, Advowsons, Reversions, Stocks, Shares, and other Properties**, will be held at the Auction Mart, Tokenhouse Yard, near the Bank of England, in the City of London, as follows:—

|                      |                      |
|----------------------|----------------------|
| Tuesday, January 20  | Tuesday, June 9      |

| Tuesday, May 12      | Tuesday, November 10 |
| Tuesday, May 19      | Tuesday, November 24 |
| Tuesday, June 2      | Tuesday, December 15 |

Auctions can also be held on other days. In any case due notice should be given, in order to insure proper publicity. The period between such notice and the auction must, of course, considerably depend upon the nature of the property intended to be sold.—86 Chesham, London.

BEXHILL-ON-SEA.

Between St. Leonards and Eastbourne, with Railway Station on the Estate.

**MESSRS. E. & H. LUMLEY** beg to announce that the extensive improvement works which have been carried on at a cost of about £50,000 are now complete, and invite the attention of builders, contractors, and capitalists to the valuable sea frontage now ripe for buildings. Leases will be granted on easy terms, and every facility afforded for developing this very promising seaside town.

Plans and particulars may be obtained of Lumleys, agents to the freeholder, the Right Hon. Earl DE LA WARR, at 21 St. James's Street, Piccadilly, S.W.

VAUXHALL.

On the Albert Embankment, in close proximity to the river. A Freehold Building Site of about 12,500 square feet, with extensive frontages to the road and pathway of the Embankment, close to Messrs. Doulton's Potteries and other large factories, and well adapted for the erection of a warehouse, Public Hall, or business premises requiring space and a prominent and commanding position unequalled in the district.

**MESSRS. FAREBROTHER, ELLIS, CLARK & Co.** are instructed to offer for **SALE BY AUCTION**, at the Mart, Tokenhouse Yard, E.C., on Thursday, February 12, 1885, at 2 o'clock, the above valuable **FREEHOLD BUILDING SITE**.

For particulars apply to H. E. Brown, Esq., Solicitor, 23 Great George Street, Westminster, S.W.; or to Messrs. Farebrother, Ellis, Clark & Co., 23 Fleet Street, and 18 Old Broad Street, E.C.

MILE END, E.

**MR. BRADSHAW BROWN** will **SELL BY PUBLIC AUCTION**, on the premises, on Wednesday, January 21, 1885, at 11 for 12 o'clock, the valuable Lease of a complete Terra Cotta Works in Maplin Street, Mile End Road, E.C., comprising the premises, with three chimneys, two kilns, and kilns, shaping, mixing, modelling, and drying rooms, with shelves, offices, cart-house, 3 stall stable, good yard, and vacant land, comprising an area of about 17,000 feet.

The premises are suitable for almost any business requiring large ground space. Held on Lease for 20 years unexpired term of 25 years from Michaelmas 1884 at £70 per annum.

Particulars and conditions of sale may be obtained of Henry J. Jennings, Esq., Solicitor, 53 Lincoln's Inn Fields, W.C., or at the Auctioneers' Offices, 59 Fenchurch Street, E.C., and Millwall, E.

Result of Sale at Lewisham.—First Portion of the Priory Estate.

**MR. RICHARD J. COLLIER** has the pleasure to announce that, in addition to the 51 Lots of **FREEHOLD BUILDING LAND**, included in his Auction Sale, at the Plough Tavern, High Street, Lewisham, on Monday Evening, 27 additional Plots, forming a further portion of the Estate, were at the request of the company present, submitted to public competition, the whole, with the exception of four small plots (with-  
drawn for the present) being **SOLD**. Mr. Collier also begs to announce that since the auction 25 additional plots have been sold by private treaty; also that a further portion of the estate will be offered for sale by auction early in February next, full announcements of which will be duly given.—Offices, 28 Finsbury Pavement, E.C.

City of London, Paternoster Row.  
A valuable Freehold Building Site of about 1,770 square feet.

(Late GREEN & KING.)  
House Painter, Upholsterer, and General Contractor,  
4 Lower Seymour St., Portman Sq., W  
(Late of 100 NEW BOND STREET).  
DESIGNS PREPARED AND ESTIMATES GIVEN.

**IMPORTANT CHANGE OF NAME.**  
THE Name of the Celebrated Qualities of HONE STONE produced from the Water of Ayr Stone Quarry and Hone Works, and esteemed and known in the market as "Water of Ayr Stone," "Snake Stone," and "Scotch Hone," and exclusively supplied by me and my predecessors for about one hundred years past, is now changed to the distinctive name "Tam o' Shanter" Hone or Stone, and some of the grades of quality suited for special purposes will be known as "Dalmore Hone," "Montgomeriestone Hone," and "Soutar Johnny Hone."

Every Stone will bear a Label or Stamp with one or other of these Names, and the Public are earnestly requested to ask for it accordingly, as only the very inferior sorts, and those hitherto rejected at my Quarry, will now be sent out by me as "Water of Ayr Stone" or "Snake Stone."

JOHN G. MONTGOMERIE.  
Water of Ayr Stone Quarry & Hone Works.  
Dalmore, Stair, Ayrshire; July 1884.

**VOLUME XXXII. OF THE ARCHITECT.**  
Handsomely Bound in Cloth, Gilt Lettered, price 12s. 6d.  
Office: 175 Strand, London, W.C.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"Sir,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy." "JAMES WEIR, F.R.I.B.A.

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

# CHAS. D. DOUGLAS & CO.'S SPRINGLESS LATCH-BOLT LOCKS.

BROMHEAD AND DOUGLAS'S PATENTS.

## "OPEN SESAME"

(REGISTERED).

### REVERSIBLE LATCH BOLT.

ANY SLIGHT TURN, PULL, OR PUSH of the door handle opens the door AT ONCE. These Locks have NO SPRING to the latch bolt to wear and become weak. The movement of the Latch is caused by weight. The weight is regulated to give a PERFECT ACTION, and as the weight never varies, the action always remains perfect. It is the finest action Lock made, and from the ABSENCE of the GRINDING action of the spring, will be the most durable. In addition to the weighted latch-bolt action, the locking bolt is fitted with levers, which give the greatest amount of security, and the combination forms the SIMPLEST, CHEAPEST, STRONGEST, and most SECURE Lock in the Market. The Action of the Latch is surprisingly EASY, EQUAL, PROMPT, and Frictionless. Damp and Wet have no effect on the action of the latch bolt. Made in all shapes and sizes of STRAIGHT and UPRIGHT MORTICE and RIM LOCKS and LATCHES.

# The Architect.

## THE WEEK.

THE death of Mr. JOHN WHICHCORD will cause surprise to many of his friends. He was sixty-one years of age, but his appearance and manner were those of a man in the full vigour of life. Indeed he seemed to be more like a constant frequenter of the hunting-field or a yachtsman than an architect whose work mainly lay in London. Mr. WHICHCORD was a witness that was invaluable in arbitration and valuation cases, and he acted frequently as assessor. This experience gave him a rather authoritative manner, which sometimes made strangers believe that he was arrogant, but no man could be more disposed to consider objections which might be made to his pet theories or be more open to conviction. The longer he was known the better he was liked for his manliness, and Mr. ALMA TADEMA expressed the experience of a good many when he said that Mr. WHICHCORD came to him as a subject for a portrait, but before the painting was finished he had made a friend of him. There were objections raised to his appointment as President of the Institute of Architects, which made the office unenviable, but he discharged all the duties as he did his daily work, that is, zealously and with credit to himself. Mr. WHICHCORD was a type of the "City architect," and as such might almost be considered to take the place of Sir WILLIAM TITE. His business, therefore, was not confined to the designing of buildings, and comprised the variety of work which arises when they are considered as property and investments. Mr. WHICHCORD made his acquaintance with construction as a science at a very early age, and although he wrote archaeological essays the world's verdict was that he was better qualified to deal with modern building work. Among the large works which he carried out were the Grand Hotel at Brighton and the St. Stephen's Club; but his chief building is probably the fine block belonging to the Safe Deposit Company, where his practical skill found congenial exercise in devising a building into which thieves could not enter.

THE attendance at the funeral of Mr. WHICHCORD, which took place at Kensal Green Cemetery on Thursday, was a testimony of the esteem in which he was held by the profession. There were deputations from the Royal Institute of British Architects, the Institute of Surveyors, the Institution of Civil Engineers, the District Surveyors' Association, and the Jerusalem Masonic Lodge. Amongst those present were Sir JOHN MONCKTON and Sir CHARLES HUTTON GREGORY, C.E., K.C.M.G., Messrs. E. R. ROBSON, J. MACVICAR ANDERSON, W. H. WHITE, THOMAS CHATFIELD CLARKE, OCTAVIUS HANSARD, ALFRED CONDER, J. TAVENOR PERRY, HENRY CURREY, EWAN CHRISTIAN, JOSEPH CLARKE, ARTHUR CATES, Professor HAYTER LEWIS, BENJAMIN TABBERER, JOHN CLARKSON, BANISTER FLETCHER, ROBERT WALKER, WILLIAM CUNNINGHAM GLEN, C. L. EASTLAKE, and COLE ADAMS.

It is evidently considered to be an advantage to belong to the Surveyors' Institution. There are for this year's examinations upwards of one hundred candidates. The Students' Entrance Examination will be held on the 20th and 21st inst., and fifty-five of the candidates are entered for it; the remainder are for the professional examinations in April next for land agents, valuers, and building surveyors. By the provisions of the charter, candidates for the Professional Associateship can now enter by examination only. The compulsory examination for the Fellowship does not come into force for several years to come, but a considerable number of candidates who have already passed the Professional Associate's Examination have offered themselves for the voluntary examination for this class.

LAST summer an exhibition of crown jewels was held in the Louvre, in order to obtain funds for the metal-workers' art schools. It has been lately discovered that one of the ornaments contains false stones, and suspicions have been

excited. It is known that the jewels have been reset from time to time to suit changes of fashion, and, owing to the skill with which imitations are produced, it might not be impossible to deceive the guardians who had charge of the treasures. But in the case that is now talked about in Paris there are no grounds for complaint. In 1861 there was a fancy ball in the Tuileries, and the Empress decided to appear as a Venetian lady of the highest rank. The costume allows of the use of a large quantity of jewels, and as those belonging to the State were insufficient in number imitations were used. The principal charm was the collar of pear-shaped pearls, united by a network of gold, which is one of the most magnificent ornaments in existence. The strictest investigation has shown that there are no grounds for supposing that false stones have been foisted into the collections during the late empire.

THE energy which is shown by engineers in seizing everything that pertains to construction, is exemplified by one passage in Sir FREDERICK BRAMWELL'S address. In referring to silos, it was said that the credit for the introduction of those stores could not be claimed by the civil engineer. Nevertheless, he is rapidly turning his attention to the improvement of the details. This is characteristic. The engineer is also getting hold of farm-buildings, and it will not be his fault if he does not secure the building of the farmers' residences—that is, supposing the English farmer does not become extinct through foreign competition.

It was lately supposed that the Porte Saint-Denis in Paris, which BLONDEL designed, could not be restored, and that its demolition was inevitable. As a record of the victories of LOUIS XIV. it may not be pleasing to Republican eyes, and it is no longer surrounded by the picturesque crowd of customs' agents, peasants, and travellers which may be seen in old views of Paris. The Commission of Historic Monuments appeared to think that removal was the best course; but within the last few days it has been resolved to make another attempt to restore the gate. If the consent of the Municipality can be obtained, the passage through it will be stopped and the gate will be enclosed with hoarding. Then the work will begin. It is difficult to know what to do with the sculpture. Through some mysterious reason the figures have not been able to resist the atmosphere of Paris, although it contains so little that is deleterious to stone, and it seems absurd to re-create GIRARDON'S allegories, which have lost all interest.

THE exhibition of carpentry and joinery which was held at the Carpenters' Hall last summer, is to be followed by a course of free lectures on subjects connected with building addressed to artisans and others engaged in the building trades. The co-operation of gentlemen well qualified to instruct and interest an audience has been secured. The lectures, which are to be given on Wednesday evenings in February and March, at the hall in London Wall, will be eight in number. The lecturers will be Professor KERR, of King's College; Professor CHURCH, of the Royal Academy; Professors BONNEY, CORFIELD, KENNEDY, and ROGER SMITH, of University College, and Messrs. BLASHILL and SLATER. There can be no doubt that these lectures will be found valuable by students of architecture, as well as by those to whom they are immediately addressed. Such students will be welcomed, if they attend.

THE King of BAVARIA is alone among monarchs in taking a personal interest in art, and His Majesty has undergone great expense in order that his architects may be able to give reality to their ideas of ancient buildings. WAGNER'S "Walkure" allowed an opportunity to construct an ancient German house such as HUNDING was likely to inhabit. It was erected in the Parc de Linderhof. The King, who loves to be secluded from the ordinary life of a court, and to allow his poetic imagination to revel in visions of the past, is accustomed to spend a part of every winter at Linderhof. There at least he can fancy that he is a Paladin of the Wittlesbach. As HUNDING'S dwelling was a favourite resort, the servants were anxious that it should be comfortably warm, and by some accident the fur with which it was hung caught fire and the structure was destroyed.

## TENURES OF BUILDING SITES.

WHEN ADAM SMITH was writing his "Wealth of Nations" he was struck by the fact that house rent was dearer in London than elsewhere, while furnished apartments were cheaper than on the Continent. He came to the unexpected conclusion that the dearness of the houses was the cause of the cheapness of the lodgings. Every landlord in London acted the part of a monopolist, and demanded a higher rent for a single acre of bad land than could be had for a hundred of the best in the country; and from a peculiar custom, which obliged every master of a family to hire a whole house from top to bottom, that rent was paid. The tradesman was therefore obliged, said SMITH, to use the ground floor for his shop, the garrets for bedrooms, and, to obtain a part of his rent, he let the two middle storeys to lodgers. The London tradesman expected to maintain his family by his trade, and not by his lodgings, "whereas at Paris and Edinburgh the people who let lodgings have commonly no other means of subsistence, and the price of the lodging must pay not only the rent of the house, but the whole expense of the family."

In this statement we can see a few of the anomalies and difficulties which still surround the tenure of houses in London; but since SMITH wrote they have been multiplied in number. An acre of land in the City is worth more than a hundred acres in the country. Shops are consequently dearer, and the upper parts of a house have to be turned to a more profitable use than for living and bedrooms. The struggle to keep a house is therefore in London more exhausting than in the last century. Men in those days were not so disposed as they are now to ask troublesome questions, and their exertions to meet the exactions of the monopolist landlords were taken as a matter of course. But when some people began to investigate the conditions of the globe in ages before man appeared on its surface, it is not surprising that others less venturesome should be attracted by primitive institutions, and that it should be asked what was the origin of that property in land, of which the London landlord exemplifies the most advanced development? The inquiry has produced very curious information from time to time, and a late addition is found in the collection of "reports which have been prepared by Her Majesty's representatives abroad on the system of tenure of dwelling-houses in the countries in which they reside." We have in them official statements, without a syllable of exaggeration, on the laws and customs relating to building sites in twenty-two European kingdoms.

What is apparent at the first glance is that the English system of letting sites on terminable leases has found little favour abroad. In Austria, such agreements are unknown. In Bavaria, land can be sold or let on the condition that the purchaser shall build houses, but we are told that land is never let and very seldom sold on such a condition, since, as a general rule, no necessity exists for it. Ownership is so general that the floors in the workman's dwellings in Munich have separate proprietors. Belgium is a country in which many things relating to buying and selling have been derived from England, and there is some approach to the English system. But in Holland, which has been less affected by foreign influences, and has a greater esteem for stability, a purchaser obtains an absolute or freehold right in the site. There is even nothing resembling the copyhold tenure of England. The French have had so many changes in the course of a century it is not surprising that great latitude is allowed in transactions relating to the disposal of land. But it is remarkable that upon the expiration of a lease the tenant is recouped for his outlay on the buildings. We are informed that "the calculation is based on the principle that the lessee should not only obtain an annual income varying from 4 to 6 per cent. of the capital expended, but that the money laid out on the buildings should be redeemed." This is a great advantage over the English custom. The Germans look favourably on the creation of large estates. Yet it appears that a special covenant would be needed to create the ordinary English tenure, and such a contract between parties is unknown in Prussia and Germany in general.

Italy is too young as a kingdom to have systematised all the customs of her various states, but freeholds find more favour than leaseholds. Even in Rome, where speculation

abounds in respect of buildings, tenants can redeem the rent by paying an amount of money that is equivalent to twenty years' purchase. The tenures of Spanish property are not to be explained in a sentence; but dwelling-houses are mostly freehold, and long building leases are unknown in Spain. If the system ever existed in Portugal, it has fallen into disuse. Turning eastward, we find that in Servia no houses are built except on freehold ground, and a building lease is not recognised by the law. Roumania has copied France, and has a Société de Construction in Bucharest. The sites for the new buildings which are let out in flats, as if they were in Paris, have, however, to be purchased as freeholds; ground-rents are unknown in the rural districts. It is not flattering to us to find a resemblance to the English lease in Turkey. There are five classes of landed property, and four kinds of freeholds. A small lot can be sold outright as a site, but it is sometimes let for a term at an annual rent, on the condition that the houses are to become the property of the landlord at the end of the term. Property which is known as endowed, or "vakouf," cannot be sold, and whatever is built on it belongs to the administration without any compensation being given to the builder.

From the extent of the Russian empire there must be variety in the customs, and it is not surprising that authorities differ about them. The Secretary to the Embassy says that the system of letting land on long building leases does not prevail in Russia; whereas a lawyer, who was consulted, states that the leases do exist, and that it is usual to stipulate that at the end of the term the houses shall become the landlord's property. In Poland the Code Napoléon rules. The Poles live generally on their own land, which is sure to be mortgaged, and houses in towns are freehold. It is possible, however, to make a building lease like the English, but it is uncommon. In the Baltic provinces the law is said to be based on Roman law, and in agreements, it is usual to stipulate that the lessee is to have liberty to remove his buildings if he cannot agree for their sale. By the law in Finland, the lessee can be compelled to remove his houses or to sell them to the landlord at a valuation.

Under the Swedish arrangements freeholds are usual, but building leases of fifty years are often adopted wherever villas are to be erected, as in the neighbourhood of towns and bathing-places. Unless there is a stipulation to the contrary it is prescribed by the law that the lessee retains the right to remove buildings of every description, while other improvements go to the landlord. In Norway, a perpetual annual rent is recognised as well as freehold. But when a lease is entered into for a specified number of years the tenant remains owner of the house, which he is able to remove. In Wurtemberg it is difficult to obtain a lease, inasmuch as a house built on land is considered part of the general estate, and in the event of a sale by the landlord the tenant would have to retire, although he might take an action for breach of contract. Lastly, the conditions in Switzerland may be described. The Swiss are independent, and the English tenures are almost incomprehensible to them. Absolute ownership is the sole condition of property among that fine race of people.

It will be seen from the foregoing information that fixity of tenure is more prevalent in other countries than in England. Why there should be so remarkable a difference between the Continent and Great Britain is a question which has been often discussed. The theory with us is that no man can have more than an estate in his land, and that the ultimate property of all lands lies in the Crown. In practice it is otherwise, and it is possible for a man to do many things with his property which will bring about "the waste of the king's strength, which lies in his people." It is not, however, our province to consider the economic and political aspects of the question. But we may again call attention to the effect of the English tenure of leaseholds upon architecture. That expensive buildings have been erected upon ground which is held for a limited number of years is certain. The stipulations in the leases insure that so much money has to be laid out as well as paid in, and the competition between rivals will not admit in many cases of indifference to business premises. But we maintain that the general effect of the system is to create a class of buildings of which the endurance is limited, and speculative builders can adapt houses to suit all terms. What upholds the

system is the belief that life is full of ups and downs, and that permanence in any condition is not to be desired. The old-fashioned tradesmen did look forward to a perpetuation of their names in one business and in one place, but the modern idea is to "sink the shop." It is also believed that a fortune is to be made in a limited period, if at all, and hence in a place like Birmingham the Corporation are able to secure tenants for their new streets, although the leases are for short terms and the other conditions are rigorous. It is not, however, entirely wise to encourage an indifference to permanence. The Americans are examples of what it leads to, and of its effects. Fortunately there are signs that in England inhabitiveness is likely to meet with more recognition, and the reports we have noticed will have their influence towards the attainment of that end.

### "THE HISTORY OF ART."—II.\*

THE composition of M. EHRMANN'S frieze, of which the remaining part is published this week, is expressive of the history of art. History is sometimes compared to a procession, and sometimes to the course of a river, but unhappily in the case of art it is a procession with many interruptions, a river with many diversions. KANT could propose an universal history on a cosmo-political plan, in which a series of propositions were established, one leading to another with all the exactitude of EUCLID. But among them there are none which will give an answer to the question why the progress of art should not have been continuous? As M. EHRMANN shows us, the chain was broken when Rome invaded Greece, and art became the slave of the conquerors. Time, which mends so many things, for once failed. There were noble works produced for Roman patricians, but all the wealth of the empire could not give endurance to schools which grew to maturity in Greek villages. At length the barbarians arrived, and then there was a long night for art. The various groups which combine to form M. EHRMANN'S painting may seem to be disconnected, but if they are it is because they are true to what is known of the history of art. The principle which the artists recognised in working is the same, for Greeks, Chinese, Egyptians, Italians, all have professed to have had a common standard in nature; while the conditions have been so local as to appear to separate rather than to unite the men.

The very first figures that are seen in the plate which is given this week are suggestive of new conditions. If they are compared with the Greek artists that approach ATHENÉ this will be more evident. The artists of the Parthenon are inspired with a faith that is almost childlike; they have no misgivings about the necessity or the profit of what they are doing, and the Greek poet is almost as joyous as the dancers. Life in those days corresponds with the fine lines of Lord HOUGHTON:—

Great thoughts, great feelings, came to them  
Like instincts, unawares;  
Blending their souls' sublimest needs  
With tasks of every day,  
They went about their gravest deeds  
As noble boys at play.

The Renaissance artists, DA VINCI and MICHEL ANGELO, look much less happy than the Greek men, and in so painting them M. EHRMANN suggests the spirit which inspires art from the Revival. As for RAPHAEL, he was too fortunate and died too early to have known much sadness of spirit. The older artists did not weary themselves with subjective miseries, but were grateful for living in a beautiful world, containing capital models and delightful legends, which seemed to have been invented for the purpose of suggesting subjects. A Greek DA VINCI or MICHEL ANGELO would have been an impossibility. If they had lived in Athens one would not have spent a long life over a few works, and the other would not have been dissatisfied with his figures when the first excitement was over, or be filled with despair at the end of a long life. DA VINCI is here shown as the seer gazing with prophetic eye on things which have yet to be realised. Or have we the indignant

painter rebuking Prior BANDELLI, that good easy man who believed that pictures like *The Last Supper* could be produced at the rate of so many square yards per day?

How should he know the artist's inward strain,  
His vexing and fastidious discontent?  
Art he considers as a sort of trade  
Like laying bricks: if one can lay a yard  
In one good hour, how can it be so hard  
In two good hours that two yards should be laid?  
But, Signor Duca, you can apprehend  
The artist's soul—how there is ne'er an end  
Of climbing fancies, longings and desires,  
That burn within him like consuming fires;  
How, beaten to and fro by joy and pain  
He grasps at shadows he can ne'er retain.  
How sweet and fair the inward vision gleams!  
How dull and base the painted copy seems!  
We are like Danaos' daughters—all in vain  
We strive to fill our vases. Human art  
Through myriad leaks lets out the spirit's part,  
And nothing but the empty dregs remain.

That is how Mr. STORY, the sculptor, imagines what DA VINCI must have thought and spoke in the Dominican refectory, and the painter may have stood on some such occasion exactly as M. EHRMANN has represented him.

The MICHEL ANGELO of the frieze is suggestive of extreme sadness, and it is remarkable that no painter or sculptor has ventured to create a figure that would allow us to believe that the great artist ever was in a happy mood. We can suppose that in his old days, when he wrote the "Crocifisso" sonnet, MICHEL ANGELO was humble in spirit, as every line testifies:—

The pride of art, the sculptured thought,  
Vain idols that my hand hath wrought.  
To place my trust in such were naught  
But sheer insanity.

In M. EHRMANN'S picture we may take him as an embodiment of that unrest and despondency which is characteristic of art and literature. RAPHAEL, as he walks in glory and in joy, has a little that is Greek about him, but care has hold on most of the remaining painters,

It is not surprising that in the frieze, as in the "Hemicycle," a prominent place should be given to NICHOLAS POUSSIN, for, as the head of the French school, he is entitled to the reverence of Frenchmen. With reason he has been described "le peintre de la raison et des gens d'esprit," and M. EHRMANN suggests the Classicism or severity of his style by making him carry a picture under his arm like the Greek artist. Indeed, the Academicians in 1667 did compare the figures in his painting of the *Fall of Manna* with the best Greek statues, and some of his paintings have been described as ancient bas-reliefs which have been animated by POUSSIN'S pencil. In disposition he had a good deal of the antique philosopher, and, like many painters, he was not without occasions when his temper was sorely tried by patrons and officials. REYNOLDS was not an admirer of POUSSIN, whom he considered to be too simple in his arrangements, but he calls him a learned painter. But his learning was not exactly of the same kind as BENJAMIN WEST'S, who managed to paint classical subjects with the aid of a book or two. POUSSIN was the founder of the modern archæological school of painting, although he was too little of the pedant to obtrude details. In his old age he spent much time among ruins in Rome. VIGNUEL DE MARVILLE says he often met him with his handkerchief full of stones, moss, or flowers, in order to copy them exactly. "One day I asked him how he had attained to such a degree of perfection as to have gained so high a rank among the great painters of Italy. He answered, 'I have neglected nothing.'"

From POUSSIN with his "Ego in Arcadia vixi" and reminiscences of classic legend, to the Chinese artificers, there is a wide jump; and yet the freewill offerings to venerable idols are accompanied with a heartiness that compares with that of the Greek worshippers. The Easterns give of their best—silks, pottery, metal work, and joinery. Why, with the power of attaining so much beauty in those things, the Chinese did not go further, and represent the human figure properly, is a question which can hardly fail to be raised in the spectator's mind. Is it owing to the precautions by which the human figure was encased in gar-

\* See Illustration.

ments which were not always beautiful in form? Bishop VIDA in his poem tells us that the goddess VENUS, finding that her rivals had monopolised linen and wool for robes, visited China, and that, in the interest of decorum, a robe of the richest silk was presented to her. The incident indicates the difference between Greece and China, and the art of Western Europe sometimes takes one country and sometimes the other for a guide. The lover in "Locksley Hall" prefers fifty years of Europe to a cycle of Cathay. But Chinese conservatism has one advantage, for it enables M. EHLMANN to put its representatives very close to the ancient Egyptians without any appearance of incongruity. The early history of Egypt has yet to be revealed; but it has been supposed by some speculators that there is a relationship between it and that of China—at least enough to warrant the order seen in the frieze.

### MODERN ENGINEERING.

ON Tuesday Sir Frederick J. Bramwell delivered his presidential address at the Institution of Civil Engineers. In the course of it he said:—Principles are generally very soon determined, and progress ensues, not by additions to the principles, but by improvement in the methods of giving to those principles a practical shape, or by combining in one structure principles of construction which had been hitherto used apart. So far as novelty in the principle of girder-construction is concerned, I must confine myself to that combination of principles which is represented by the suspended cantilever, of which the Forth Bridge, only now in course of construction, affords the most notable instance. It is difficult to see how a rigid bridge, with 1,700 feet spans, and with the necessity for so much clear headway below, could have been constructed without the application of this principle. The St. Louis Bridge of Mr. Eads may, I think, be fairly said to embody a principle of construction novel since 1862—that of employing for the arch-ribs tubes composed of steel staves hooped together. In suspension-bridges there has been introduced that which I think is fairly entitled to rank among principles of construction, the light upper chain, from which are suspended the linked truss-rods, doing the actual work of supporting the load, the rods being maintained in straight lines, and without the flexure at the joints due to their weight. In the East River Bridge, New York, there was also introduced that which I believe was a novelty in the mode of applying the wire cables. These were not made as untwisted cables and then hoisted into place, thereby imposing severe strains upon many of the wires composing the cable, through their flexure over the saddles and elsewhere, but the individual wires were led over from side to side, each one having the length appropriate to its position, and all, therefore, when the bridge was erected, having the same initial strain and the same fair play. The employment of testing machines has come into the daily practice of the engineer. In lieu of such machines being used by the few, and at rare intervals upon small specimens, for experimental purposes, they are now employed in daily practice and on a large scale.

In harbour work we have had the principle of construction employed by Mr. Stoney at Dublin, where cement masonry is moulded into the form of the wall for its whole height and thickness. By a very carefully thought-out apparatus blocks are raised off the seats whereon they have been made, and are transported to their destination. It is no simple undertaking, even in these days, to raise otherwise than hydraulically a weight of 350 tons, which is the weight of the blocks with which Mr. Stoney deals.

A noteworthy instance of the use of pneumatic appliances in cylinder-sinking for foundations is that in progress at the Forth Bridge. The wrought-iron cylinders are 70 feet in diameter at the cutting edge, and have a taper of about 1 in 46. At their bottoms there is a roofed chamber, into which the air is pumped, and in which the men work when excavating, this roof being supported by ample main and cross-lattice girders. At the Tay Bridge, also now in course of construction, the cylinders are sunk while being guided through wrought-iron pontoons, which are floated to their berths and are then secured at the desired spot by the protrusion, hydraulically, of four legs, which bear upon the bottom, and thus, until they are withdrawn, convert the pontoon from a floating into a fixed structure.

There are, happily, cases of subaqueous tunnelling where the water can be dealt with by ordinary pumping power, more or less extensive, and where the material is capable of being cut by a tunnelling machine. This was so in the Mersey Tunnel, and would be in the Channel Tunnel. In the Mersey Tunnel, and in the experimental work of the Channel Tunnel, Colonel Beaumont and Major English's tunnelling machine

has done most admirable work. In the 7-foot 4-inch diameter heading in the new red sandstone of the Mersey Tunnel a speed of as much as 10 yards forwards in twenty-four hours has been averaged, while a maximum of  $11\frac{1}{2}$  yards has been attained; while in the 7-foot heading for the Channel Tunnel, in the gray chalk, a maximum speed of as much as 24 yards forwards in the twenty-four hours has been attained on the English side, and with the later machine put to work at the French end a maximum speed of as much as  $27\frac{1}{2}$  yards forwards in the twenty-four hours has been effected. In ordinary land tunnelling since 1862 there has been great progress by the substitution of dynamite and preparations of a similar nature for gunpowder, and by the improvements in the rock-drills worked by compressed air, which are used in making the holes into which the explosive is charged. For boring for water, and for many other purposes, the diamond drill has proved of great service, and most certainly its advent should be welcomed by the geologist, as it has enabled specimens of the stratum passed through to be taken in the natural unbroken condition, exhibiting not only the material and the very structure of the rock, but the direction and the angle of the dip of the bed.

Probably few materials have been found more generally useful to the civil engineer in works which are not of metal than has been Portland cement. During the last twenty-two years great improvements have been made in the grinding and in the quality of the cement. The artificial material, brick, cannot in these days be said to surpass in quality the bricks used by the Romans in this island 1,900 years ago, but as regards the mode of manufacture and the materials employed, there is progress to be noted. The brick-making machine and the Hoffmann kiln have economised labour and fuel, while attempts have been made, which I trust may prove successful, for utilising the clay which is to be found in the form of slate in those enormous mounds of waste which disfigure the landscape in the neighbourhood of slate quarries. Certain artificial stones, moreover, appear at last to be made with a uniformity and a power of endurance, and in respect of these qualities compare favourably with the best natural stone, and still more favourably having regard to the fact that they can be made of the desired dimensions and shape, thus being ready for use without labour of preparation.

Of timber in new countries the engineer is commonly glad to avail himself to an extent which among us is unknown. Owing to the ready adaptability of metals to the use of the engineer the employment of wood is decreasing. Many attempts have been made to render timber proof against the two great defects of rapid decay and of ready combustibility. The Asbestos Paint is used to coat the wooden structures of the Inventions Exhibition. To the employment of this it is not too much to say those buildings owed their escape in last year's very dry summer from being consumed by a fire that broke out in an exhibitor's stand, destroying every object on that stand, but, happily, not setting the painted woodwork on fire, although it was charred below the surface. A surface application may not enable wood to resist the effects of a continued exposure to fire, but it does appear that it can prevent its ready ignition.

Many improvements have been made in the transmission of power from one part of a machine to another. For long distances we have the development of hydraulic transmission, pipes being now laid down for supplying water under the 700 lb. on the square inch pressure; we have companies authorised, if not at work, for laying down pipes to distribute compressed air; we have now, by reason of the improvement in gas engines, the ability to lay on power in every town illuminated by gas, which practically means every town and large village; and we have in New York and in some other cities of the United States high-pressure steam, conveyed in mains below the streets, to be used both for power and for heating, for which second purpose, however, it should be remembered the contents of a gas main are equally available. There is the rope system at Schaffhausen, and we may take it as clearly established that we are, day by day, becoming more alive to the benefit, where little power is required, or where considerable power is required but only intermittently, of deriving that power from a central source.

Except in the magnitude of the work and the excellence of the design, of which the new Liverpool waterworks now in progress may well stand as a typical example, there is not much to say as regards progress in those waterworks which are dependent upon storage. In the United States and Canada the waste of water that takes place not only causes the mains to be incapable of keeping up the pressure under the excessive draught, but renders sources of supply insufficient which otherwise would be ample for years to come. Progress has been made here in the matter of house-fittings, by which waste has been greatly checked and the risk of contamination that formerly existed with certain closet-fittings is ended. This question of house-fittings has always been a difficult one and cannot be grappled with by water authorities such as those in the United States and in Canada, *i.e.* municipal authorities afraid of offending the voter. We owe it, however, to Mr.

Deacon, the engineer of an English municipal water authority, that it is now possible to deal with the correction of household fittings at a minimum of cost and, what is equally important, with a minimum of annoyance to the householder. By the employment of the waste-water meter, situated under the flag-stones of the footway and controlling a group of houses, it is possible to find out the total waste in the whole of those houses and on the mains supplying them; then to localise that waste so as to attribute its true proportion to the houses that are the offenders, and to attribute the proportion, if any, to the pipes of the suppliers of water. Having ascertained these facts, not only can the suppliers of water cure the defects in their pipe system, but they are enabled to cure the household waste, not by the expensive and annoying process of an inspection of the fittings throughout the whole district, involving the annoyance of, say, ninety householders whose fittings are in perfect order to detect the ten householders whose fittings are in a reprehensible condition, but by the mere visitation of these ten who are in default, and who cannot, therefore, complain of the visitation. In most of our towns the supply is satisfactory; but in spite of the alarm raised by the suggestion of double mains, we might do well in many cases where there is a pure but limited supply to have a dual system of mains, and thus to distribute the pure water separately and for potable purposes. The Parisians, at least, have recognised the expediency of thus sorting their supply when that supply is of varying quality, and when the best of it is limited in quantity.

In cases where there appears to be no thoroughly satisfactory source of water, the experience of the efficacy of iron purification, as practised at Antwerp, does hold out very considerable promise. Gas likewise has been alluded to under the heads of motors and of transmission of power and of heat; but I now desire to say a few words in connection with it under its more ordinary aspect—that of a distributed illuminant. In 1862 the price of ordinary coal-gas in London was from 4s. to 5s. per thousand cubic feet; the illuminating power was such that five cubic feet of the gas burnt in a specified burner in one hour should give a light equal to twelve sperm candles, each burning 120 grains in the hour. Now 16-candle gas is sold in London for as little as 2s. 10d. per thousand cubic feet. The regenerative gas-burners and other modes of burning promise to largely increase (it is said even to more than double) the candle-power per cubic foot of gas burnt. The decrease in cost and the increase in profits are largely due to the application of chemistry to this manufacture, by which application the former nuisance-creating by-products have been turned into sources of revenue and into fertilisers for our fields. Valuable improvements in gas-furnaces have enabled coal-gas to be applied to the melting of even very refractory metals by means of a most inexpensive plant.

## PROFESSIONAL CHARGES IN AMERICA.

THE following is the revised schedule of charges and professional practice of architects adopted by the American Institute of Architects at the last convention:—

### General Provisions.

For full professional services (including supervision) five per cent. upon the cost of the work. In case of the abandonment of the work, the charge for partial service is as follows:—

|  |             |
|--|-------------|
| Preliminary studies . . . . .  | 1 per cent. |
| Preliminary studies, general drawings and specifications . . . . .           | 2½ "        |
| Preliminary studies, general drawings, specifications, and details . . . . . | 3½ "        |

For works that cost less than 10,000 dols., or for monumental and decorative work, and designs for furniture, a special rate in excess of the above.

For alterations and additions, an additional charge to be made for surveys and measurements. An additional charge to be made for alterations or additions in contracts or plans, which will be valued in proportion to the additional time and services employed.

Necessary travelling expenses to be paid by the client.

Time spent by the architect in visiting for professional consultation, and in the accompanying travel, whether by day or night, will be charged for, whether or not any commission, either for office work or supervising work, is given.

The architect's payments are successively due as his work is completed, in the order of the above classifications.

Until an actual estimate is received, the charges are based upon the proposed cost of the works, and the payments are received as instalments of the entire fee, which is based upon the actual cost.

The architect bases his professional charge upon the entire cost, to the owner, of the building when completed, including all the fixtures necessary to render it fit for occupation, and is

entitled to additional compensation for furniture or other articles designed or purchased by the architect.

If any material or work used in the construction of the building be already upon the ground, or come into possession of the owner without expense to him, the value of said material or work is to be added to the sum actually expended upon the building before the architect's commission is computed.

### Supervision of Works.

The supervision or superintendence of an architect (as distinguished from the continuous personal superintendence which may be secured by the employment of a clerk of the works) means such inspection by the architect, or his deputy, of a building or other work in process of erection, completion or alteration, as he finds necessary to ascertain whether it is being executed in conformity with his designs and specifications or directions, and to enable him to decide when the successive instalments or payments provided for in the contract or agreement are due or payable. He is to determine in constructive emergencies, to order necessary changes, and to define the true intent and meaning of the drawings and specifications, and he has authority to stop the progress of the work and order its removal when not in accordance with them.

### Clerk of the Works.

On buildings where it is deemed necessary to employ a clerk of the works, the remuneration of said clerk is to be paid by the owner or owners, in addition to any commissions or fees due to the architect. The selection or dismissal of the clerk of the works is to be subject to the approval of the architect.

### Extra Services.

Consultation fees for professional advice are to be paid in proportion to the importance of the questions involved, at the discretion of the architect.

None of the charges above enumerated cover professional or legal services connected with negotiations for site, disputed party walls, right of light, measurement of work, or services incidental to arrangements consequent upon the failure of contractors during the performance of the work. When such services become necessary they shall be charged for according to the time and trouble involved.

### Drawings and Specifications.

Drawings and specifications, as instruments of service, are the property of the architect.

## TESSERÆ.

### Vanbrugh's Buildings.

SIR JOSHUA REYNOLDS.

IN the buildings of Vanbrugh, who was a poet as well as an architect, there is a greater display of imagination than we shall find perhaps in any other; and this is the ground of the effect we feel in many of his works, notwithstanding the faults with which many of them are justly charged. For this purpose Vanbrugh appears to have had recourse to some of the principles of the Gothic architecture, which, though not so ancient as the Grecian, is more so to our imagination, with which the artist is more concerned than with absolute truth. He had originality of invention, he understood light and shadow, and had great skill in composition. To support his principal object he produced his second and third groups or masses; he perfectly understood in his art what is the most difficult in ours—the conduct of the background, by which the design and invention are set off to the greatest advantage. What the background is in painting, in architecture is the real ground on which the building is erected; and no architect took greater care than he that his work should not appear crude and hard—that is, it did not abruptly start out of the ground without expectation or preparation.

### Luca della Robbia and Majolica.

L. ARNOUX.

We understand by majolica a pottery formed of a calcareous clay gently fired, and covered with an opaque enamel composed of sand, lead, and tin. This enamel, although melted at rather a low temperature, is much hardened by the oxide of tin it contains, and adheres perfectly to the biscuit. This biscuit has generally a light yellow colour, disappearing under the opacity of the enamel; and one of its main characteristics is to effervesce when tried by acids. It was only in the beginning of the fifteenth century that it occurred to Luca della Robbia, a Florentine sculptor, to protect his figures from the injuries of the weather by covering them with a coat of opaque enamel; he called them *terra invetriata*, and they had immediately a great success. Luca would doubtless have brought this art to a high degree of perfection if he had not died in 1430, being not more than forty-two years old.

However, this kind of manufacture was carried on by his brothers and nephews for a little more than a century, a fact which explains why we attribute to Luca della Robbia so many pieces he has not made, but which have been certainly executed by his family. It was seventy years after Luca della Robbia that some potters of Pesaro thought at last of applying to their work the enamel made by that artist. Previously to that time they had tried to make a sort of white pottery by covering their red clay with a thin coat of a whiter clay, glazing the whole with a red one, and so forming the ware called by amateurs *mezza-majolica*. As the glaze was very soft, it was liable to be affected in colour by sulphureous gases and take different hues. This *iridescent Italian ware*, anterior to the majolica, belongs to the end of the fifteenth century. When these potters, therefore, adopted the enamel of Luca della Robbia, it made quite a revolution in the ceramic manufacture of the time. Some persons called it *porcellana*, but the name of the majolica prevailed, and shows that Italy took its receipt for the island of Majorca. It was from 1540 to 1560, during the finest artistic period, that the best pieces of majolica were made. The Duke Guidobaldo took this manufacture under his patronage. By his orders beautiful services of majolica were made, which he used to send to the princes of his time, in the same way as the French kings have done since with the Sèvres porcelain. Although Michael Angelo, Raphael and Julio Romano could not devote any of their time to majolica, their paintings, at any rate, had a great influence on the decoration of this pottery, and we can frequently recognise their designs on the majolica of the sixteenth century.

#### Roofing Slates.

PROFESSOR SULLIVAN.

Good roofing slate should be of an uniform fine grain, should split easily into even plates, which may be easily pierced with holes by a sudden blow of a sharp-pointed instrument without being fractured. The colour should not be very dark, as this indicates a large quantity of carbonaceous matter, the presence of which assists in the decomposition of the slate. It should also be free from pyrites. Finally, it should not absorb much water either by its surface or edges, a point which is readily ascertained by weighing a piece of the dry slate, plunging it into water, and then weighing it again when the surface has partially dried.

#### Arithmetical Proportion in Painting.

THOMAS PHILLIPS, R.A.

One main point in the perfection of composition relative to form, technically speaking, and without reference to subject, consists in that proportional division of the surface employed, which at once presents to the eye an agreeable combination of forms and spaces. "Proportioned quantities," says Lomazzo, "is the matter of painting; and form is the regulator of those quantities; and it extends throughout the whole surface of a picture." Such is the language of an author, who, living at a time when the art was highly cultivated and employed, must have received his tenets from the best authorities. What I mean by proportional quantities, or divisions of the surface, will be easily comprehended in its principle, though there may doubts arise in many minds as to the practical application of it. There are, however, some points upon which all agree; such as the impropriety of having many equal parts, or parts equal in quantity, or many similar forms; or of having the forms of diverse parts so range with each other that they may not easily be separated. On such points there can be no doubt: experience has taught us how much delight our eyes receive from variety and distinctness of form; but the exact proportion of parts which is requisite is not so easily determinable. The more I have considered the subject, and the more I find myself compelled by practice, the more I am satisfied that its basis is determinable by numbers. I say the basis upon which it rests; for I conceive that the nearer an artist approaches to some arithmetical proportion in, or between, his masses, or his forms and spaces, among themselves, or each to the other, the more acceptable will his compositions be; not only to those initiated in the art, but also to the common observer.

#### Wren's Construction.

JOHN CLAYTON.

It will be hardly necessary to observe that Wren's towers and spires were built "in the most substantial and workmanlike manner," and to adapt the words of modern specifications still further, "the materials used were the best of their respective kinds;" but here ends the similitude. Wren put a different construction on these words from that often given in the present day; with him none of the funds which should be expended in stability were wasted in decoration—a fault which is perhaps mainly attributable to the present defective state of competitions, with which Wren was not troubled. The walls of the towers vary from 5 feet to 7 feet in thickness, and are of

solid masonry, sometimes backed up with brick, but generally with stone of a rougher description. The stone is Portland, the timber oak, and the lead must have weighed at least 10 lbs. to the foot superficial. The floors in nearly all the towers are carried upon corbels, a preferable mode to inserting the ends of the beams in the walls, as the floors are more readily replaced when decayed, and the walls are not so liable to be injured by fire or strains. The towers have in nearly every instance convenient access to the belfry or parapet by circular stone staircases; and it is worthy of notice that the front line of the steps runs to the centre and not to the face of the newel, as is usual in Gothic staircases; this perhaps occasions a little more work, but gives a much better tread. The block cornices and enriched parapets, which are so frequently imitated in the more modern parts of the metropolis, were first used by Wren.

#### Development of Mouldings.

JOHN RUSKIN.

The mouldings of the earlier times were, in the plurality of instances, composed of alternate square and cylindrical shafts, variously associated and proportioned. Where concave cuttings occur, as in the beautiful west doors of Bayeux, they are between cylindrical shafts, which they throw out into broad light. The eye in all cases dwells on broad surfaces, and commonly upon few. In course of time, a low ridgy process is seen emerging along the outer edge of the cylindrical shaft, forming a line of light upon it and destroying its gradation. Hardly traceable at first, as on the alternate rolls of the north door of Rouen, it grows and pushes out as gradually as a stag's horns, sharp at first on the edge; but, becoming prominent, it receives a truncation, and becomes a definite fillet on the face of the roll. Not yet to be checked, it pushes forward until the roll itself becomes subordinate to it, and is finally lost in a slight swell upon its sides, while the concavities have all the time been deepening and enlarging behind it, until, from a succession of square or cylindrical masses, the whole moulding has become a series of concavities edged by delicate fillets, upon which the eye exclusively rests.

#### Estimates of Light.

ROBERT HESKETH.

The distance to which light passes into a room after admission, though it makes no difference as to quantity (because exactly as the intensity of light diminishes, so the area of surface lighted increases, viz., as the square of the distances from the opening to the parts where it falls), yet, in practice, a room is found to be much better lighted when the light passes far into a room than when only to a short distance. This effect is caused perhaps, first, by the eyes adapting themselves to particular lights by a slight alteration in their form; and thus, if a room be partially lighted, they adapt themselves to the stronger partial light, and the other parts appear more gloomy. The converse of this is shown by the effect of sunlight produced at dioramas, &c., by the direct light from the sky contrasted with the darkness of the remainder of the room. The second cause is, perhaps, the better adaptation of the whole room to use when all is sufficiently lighted than when part is lighter than necessary, and part too dark for comfort. There are probably no means of forming an exact estimate of the value of the distance traversed by light after admission before it falls on the surfaces of the room. The value certainly varies where the distance varies, but it also does not vary so rapidly as the distance. From this (and consideration of facts), I think the effect (though not the quantity) of light may be deemed to vary as the square root of the average distance through which it traverses a room. For ascertaining, then, the effective light, the numerical value of the proportionate quantity should be multiplied by the square root of the distance.

#### Illuminated Manuscripts.

SIR FRANCIS MADDEN.

From the eighth to the eleventh century occur in Greek and Latin manuscripts initial letters of a large size at the commencement of books and chapters, fancifully composed of human figures, animals, birds, fish, flowers, &c. In Montfaucon an alphabet is given, selected from manuscripts of the ninth and tenth centuries, many of which are sufficiently singular and ingenious—such, for instance, as an H, composed of two men, each placing one foot on a blazing altar; a T, represented by a fox on its hind legs, holding a pole on its mouth horizontally, from the ends of which hang two cocks, &c. These letters are called by the Benedictines *historiées*, because they often bear reference to or illustrate the text to which they are prefixed. Thus, a manuscript of the thirty-fourth Homily of St. Chrysostom, commencing "Yesterday we returned from battle," is headed by a capital E, in which is depicted a warrior, armed with a spear. So in another tract, on "The Pains of Hell," the initial letter K represents an enormous serpent swallowing a man. The imagination of the illuminator supplied an inexhaustible source for this species of letters.

DESIGN FOR CHURCH AT CRICCIETH,  
SUBMITTED IN LIMITED COMPETITION BY

Spottiswood & Co. Ltd. London.

Askham Hall.  
for  
Sir Andrew Fairbairn, M.P.

Mess<sup>rs</sup> Chorley & Cannon, View of Staircase.  
Architects.  
15, Park Row, LEEDS.

## ILLUSTRATIONS.

"THE HISTORY OF ART."

WE publish the second portion of the cupola painting by M. EHLMANN, which is described on another page. The artist was born in Strasbourg, and was a pupil of M. GLEYRE.

STAIRCASE, ASKHAM HALL.

THIS interior is a companion to the view of Sir ANDREW FAIRBAIRN'S house, which appeared on the 3rd inst., and is the work of Messrs. CHORLEY & CONNOR, of Leeds.

DESIGN FOR CHURCH AT CRICCIETH.

THE design which we publish this week was submitted by Messrs. CHRISTOPHER & WHITE, of 16 Bloomsbury Square, in the recent limited competition for the new church at Criccieth, North Wales. The authors of the design were invited, with four other architects, to send in plans and estimates of a nave to seat 500, to be built with the express purpose of future enlargement, the mode of such enlargement to be indicated on the plan. The sum to be expended on the nave, exclusive of chancel and aisles, &c., was not to exceed 2,000*l.*, and under these circumstances it was felt to be impossible to include a clerestory in the design. The church, when enlarged, was to seat about 750, and the drawing shows the complete design.

The design of Mr. DOUGLAS, of Chester, is to be carried out.

## ROYAL SCOTTISH SOCIETY OF ARTS.

A MEETING of this Society was held on Monday, Mr. James Gowans, vice-president, in the chair. Dr. W. G. Black exhibited and explained the action of an air-heater, contrived by himself, for warming the air of rooms. The apparatus consists of a chamber of sheet-iron, so constructed that it can be fitted on the top of a stove. Air, allowed to enter it by one pipe, is heated in passing through, and discharged by another pipe of the same dimensions, in such a way that it will ascend towards the ceiling, and thence descend gradually and diffuse itself through the apartment. This method, Dr. Black submitted, did not involve any admixture of smoke with the heated air; it dried the air during the time it was in the chamber, and it would have a sanitary effect in destroying organic germs. Some discussion followed, in which Dr. Macadam said he did not see that the apparatus could provide for the ventilation of a room; but as far as the heating of the air was concerned, he had no doubt it would have that effect. Mr. Cay asked whether air treated as proposed would be left with the proper amount of moisture. Mr. Peebles suggested that it would be an improvement to introduce air from the outside into the heating chamber. Mr. Reid remarked that as to ventilation he had found it an effective plan to introduce ventilation into the flues, as close as possible to the cornice. Dr. Black, in reply, said that the question of ventilation had not been contemplated in his contrivance. The communication was referred to a committee.

Mr. Sang submitted "An elementary view of the strains on the Forth Bridge due to the shifting load." After explaining how the construction of the bridge in question differs from that of an ordinary stone bridge on the one hand, and that of a suspension bridge on the other, he went into calculations to show the strains due to the load that could be brought upon such a structure, irrespective of the materials of which its cantilevers are built. Taking the two central cantilevers, supported by the four piers on Inchgarvie, he made out that, when the whole length of both was covered with loaded waggons, there would be a load of nearly 1,000 tons to be carried by each of the four piers. He went on to point out that the greatest inequality of strain would occur when one side was entirely covered with waggons and the other entirely free. In this case he calculated that, taking leverage into account, while two of the piers formed the fulcrum, there would be a lifting strain on the other two of 2,700 tons. There must, therefore, be upon those two piers a counterpoising load of equivalent weight; and as the moving load might be shifted to the other end of the double cantilever, the counterpoising weight on the whole four piers would require to be at least 5,400 tons. Similar calculations were given regarding the double cantilevers towards the shore ends of the structure, with respect to which different conditions were shown to bring out somewhat different results. Mr. Sang concluded by intimating that other points would be taken up in a subsequent paper. In the course of discussion,

Mr. Westland pointed out, among other things, that a counterpoise such as Mr. Sang had shown to be required was provided by tying down the piers to masses of masonry. Mr. Cay spoke of the wind pressure as still a doubtful element in connection with such a structure.

## THE PETERBOROUGH CATHEDRAL SQUABBLE.

THE following is the statement of the Society for the Protection of Ancient Buildings on the controversy between various members of the Restoration Committee:—

It is no part of the duty of the Society for the Protection of Ancient Buildings to see to the maintenance of contracts; but when a contract of recent execution has been entered into for the reconstruction of an ancient tower, "stone for stone," and it is proposed essentially to vary that contract and to construct a new tower, it becomes the duty of this society to call the attention of the subscribers and of the public to the following statements made by, or on behalf of, the Dean and Chapter, one of the parties to the contract, and of the Restoration Committee, "set up to give confidence to the public," in this very matter of the devotion of the funds subscribed to the purpose for which the appeal to the public had been made.

On January 29, 1883, in an "authentic statement" forwarded to the *Times* for publication, Canon Venables states that:—

The Chapter-house and the Restoration Committee have come to the decision that the tower must be taken down without delay to the point indicated by Mr. Pearson, together with the piers, and rebuilt, as far as possible, stone for stone. Mr. Pearson's estimate for this taking down and rebuilding is 13,000*l.* This does not include any additional height being given to the tower which is desired by many. At present the restoration fund stands at about 3,700*l.*

On March 1, 1883, the *Times* reports that:—

The first of a series of diocesan meetings, to be held in furtherance of the restoration of Peterborough Cathedral, was held at Peterborough yesterday, the mayor of the city presiding. . . . The Dean of Peterborough made a statement showing that the architect consulted (Mr. Pearson) had recommended two alternative plans. The first was to put centring into the arching of the condemned central tower, and to provide a strong concrete foundation on which the pillars might be rebuilt, and only to repair the stonework above and between them and the belfry stage, and then to rebuild and restore the lantern. . . . The committee appointed to carry out the undertaking decided to adopt plan No. 2, viz., 'to take down all the work over the arches and also the arches themselves, and to rebuild the whole.' . . . There was no intention to destroy the ancient character of the present tower. Every stone would be taken down and numbered, and replaced exactly as at present.

On the same day, March 1, the Dean writes to this society:—

I must apologise for not answering your letter sooner (a letter advising plan No. 1 in the foregoing statement). . . . I have now read your letter to Mr. Pearson, and he desires me to say that he adheres to his former opinion that any work done to the tower short of its entire reconstruction would not be satisfactory. It is better to make the whole thoroughly secure than merely to patch, especially as it seems desirable to raise the tower, should funds be forthcoming, and this could not be done with the present piers and foundations. I wish, however, to observe that the tower will be *accurately reconstructed* (here the italics are the Dean's) *stone for stone*. Every stone as taken down will be numbered and replaced.

On March 19, 1883, Canon Argles writes to this society:—

I beg to affirm the full determination of the Chapter that the tower shall be rebuilt, stone for stone, exactly following the drawings and photographs which have been taken of every part of that which is to be taken down.

On March 30, 1883, the clerk of the Chapter writes to this society:—

I need not assure you that they (the Dean and Chapter) desire, under the fullest sense of the responsibility imposed upon them, to make the best possible provision for the effective preservation of the building which is committed to their charge; and this they believe they have done by adopting the plans which they have now definitely approved.

And on February 1, 1884, the Dean, appealing through the *Times* for additional funds, and reviewing the history of the restoration, writes:—

Mr. Pearson, the Cathedral architect, when summoned to examine and report upon it, recommended that the upper portion should immediately be taken down, and that the whole of the central tower and the two eastern piers should be reconstructed. The Restoration Committee, at their first meeting on January 24, 1883, adopted the report of the architect, and a contract was entered into for the reconstruction of the tower, as recommended in the report, at an

estimated cost of 13,073*l*. The subscriptions already promised, as will be seen by the advertisement in the *Times*, now amount to 19,548*l*. 5*s*. 3*d*. This amount does little more than cover the contract for taking down and rebuilding of the central tower. No margin is left for incidental expenses, and a large sum is still necessary for insuring the safety of the choir and other important matters which must follow from what has been already done.

No word here about a new or raised tower, and this is the last appeal made to the public through the *Times*.

On May 7, 1884, in the presence of the Bishop of Peterborough, the Dean and Chapter, the Restoration Committee, and a numerous and distinguished assembly, with full masonic and religious rites, the foundation-stone of the tower to be reconstructed was laid by Lord Carnarvon, the plan of the proposed building was inspected and delivered by his lordship to the architect, with the request that he would proceed without loss of time to the completion of the work in conformity with the plan, and finally, and presumably for the safe completion of the work so augustly begun, prayer was offered by the Bishop of Peterborough.

It will thus be seen that the published intention of the Dean and Chapter and of the Restoration Committee was to reconstruct the tower exactly "stone for stone." The proposal to raise the tower had been before them, but had been definitely put aside in favour of a plan which in terms excluded that proposal (for a reconstruction of the tower "stone for stone" is incompatible with the raising or other alteration of the tower). And upon that published intention and contract opposition was set at rest, and funds were appealed for and obtained.

It is now proposed to cancel that contract, and to do the very thing its avowed purpose and the published intention of the Dean and Chapter and of the Restoration Committee, "set up to give confidence to the public," purported precisely to exclude the possibility of.

It is possible that behind the published intention there may have been in the minds of some the unpublished intention not to reconstruct the tower; but, when funds had been obtained upon that pretence to build up the piers to support it, then to suggest that it would be "lunacy" to lose so fine an opportunity. The tower is down. Why not build upon the piers competent to support it a new old tower, "early and good," and trust to bluster and the weariness of the public to get what is wanted?

It is possible enough. But it is to be hoped that the public will not allow itself to be wearied out of an historical and beautiful possession, or to be wearied into permitting a scandalous breach of public faith, or into a permanent memorial of one great "lunatic," whom the world will do well at once to forget.

The Dean and Chapter and the Restoration Committee entered into a contract with the public to rebuild the tower of Peterborough Cathedral, "stone for stone," exactly as it stood before it was by them pulled down. To that contract we hold them still in honour to be bound, and we appeal to them, and especially to the Dean and Chapter, in whom the legal power is vested, to let nothing whatever, no pressure of opinion, public or other, induce them to give way. They are the custodians of the building for future ages as well as for the present, and they must look to it that in this matter they do their duty unflinchingly.

The tower to be reconstructed is a fine piece of fourteenth-century work. It is good in design throughout, good particularly in the bold prolongation of the windows and the adjustment of their sills to the slopes of the roofs, a characteristic of the design which would be lost, misplaced, or stultified were the tower to be raised or another tower to be built upon it. The Dean and Chapter and the Restoration Committee need not fear, then, that what they are asked to preserve will not be worth the struggle they may have to undergo to maintain it. The tower of Peterborough Cathedral is an historical document of quite exceptional value, worthy on that account alone to be preserved; but it is also beautiful in itself, beautiful in association with the other features of the cathedral, and singularly skilfully designed to meet and overcome the peculiarities of the circumstances under which it had to be constructed.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

At the meeting of the Edinburgh Association on Monday, Mr. Washington Browne in the chair, Mr. John Kinross read a paper on "The Study and Progress of Architecture." After a humorous reference to the way in which many young men found themselves in what he called the "ill-paid profession," Mr. Kinross proceeded to notice the chaotic state in which the question of style was at present, and the difficulties which that presented to a student in determining what style he should devote his attention to. For a comprehensive study of archi-

itecture time and means were necessary, and he advocated, if that were possible, the study of the noble works of Italy and Greece, not merely from drawings, but as they stood on Italian and Grecian soil. The refining effect of such study could not be over-estimated. He differed from Mr. Fergusson in thinking that Scottish work was not worthy of study. There was much beautiful early work still remaining in Scotland, and also admirable domestic work, which perhaps deserved to be studied more than any other kind of Scottish work. Scottish country mansion-houses seemed to grow out of the ground; they fitted in to nature; and the proportion of their rooms and the beautiful detail that was in them made them worthy of study. In speaking of progress in modern architecture, Mr. Kinross said they had in Edinburgh a very brilliant example as to the effect of very careful study of the Italian Renaissance and a judicious use of the best materials; and they had also a very fine example of what the study of their old Scottish would lead to in the new block built by Mr. Findlay at the Water of Leith. These buildings, though in very different styles, showed beautiful results of careful study and good taste. In England, it was remarked, great progress had been made during the last twenty years, and of that some account was given—the work of the leading architects being referred to. These men, he said, by their work, showed that their study of old buildings had been very complete, and even granting that, to begin with, they were men of great capacity and taste, it had been only after much hard work that they had arrived at their present eminence. Great reputations were not easily won or supported, but every student could determine that the noble art of architecture should not suffer at his hands, and endeavour to follow the great men who went before him.

Mr. McGibbon said he was satisfied that no architecture was more worthy of their study than the Scottish. It had not the characteristics of Classic architecture, but it had characteristics of its own. He hoped that none of them would be discouraged by the great admiration which Mr. Kinross had expressed for the foreign birds, which were finely feathered, but that they would seek to study what was near to their hand. It was very desirable that young men should have an ambition to see the great buildings which existed in other parts of the world; but, in order to fully appreciate these, they should first study what was near them, and know what study was.

The Chairman thought that Mr. Fergusson, of all critics, was most misleading and least to be trusted by young students, especially in reference to Scottish architecture. He did not know whether Mr. Fergusson had ever studied it himself. He spoke of it as if he had not. *Apropos* of a remark by Mr. Kinross, that progress was only possible by the mingling of the best of every style, the chairman said it was only a first-rate man that could be trusted to mix styles. He should dread the result if any second-rate man tried it.

Mr. Kinross, in his reply, said that Mr. Fergusson might be unsafe, but he was the only authority they had. It would certainly be desirable if they had a book on architecture not so voluminous as Mr. Fergusson's, and safer.

The thanks of the meeting were given to Mr. Kinross for his paper.

### EGRESS FROM BUILDINGS.

THE Committee appointed by the Glasgow Town Council to consider the means of egress from music-halls and public buildings in the city have, after a conference with the Master of Works, prepared the following document:—

*Regulations to be observed in the Construction, and during the Occupancy, of all Buildings intended for accommodating large numbers of people, such as Theatres, Music-halls, Public Halls, Churches, &c.*

#### CONSTRUCTION.

1. Every floor or part of a floor of the building shall be provided with a separate egress or egresses, and shall have a capacity for same equal to one foot of breadth for every seventy persons which can be accommodated in each floor or section thereof to which such egress pertains.
2. Where entrance is obtained to any part of the building by means of a staircase, the accommodation in such part shall be diminished in the proportion of ten persons per foot in breadth of entrance for each tier of the building ascended.
3. All stairs to be provided with hand-rails on both sides, and each stair exceeding six feet in width shall be divided by a substantial hand-rail fitted up in the centre.
4. All stairs shall be constructed without wheeling steps, and each flight not to have more than twelve steps, each step to be not less than eleven inches broad and not more than six inches deep, and no hanging stairs will be allowed unless supported at the outer end.
5. Every plathead shall be of the same width as the stair.
6. All staircases and lobbies shall be constructed of non-inflammable material, and shall be so placed that they can be conveniently got at from every part of the building.

7. Doors at all parts of the building to open outwards. The following rules are to apply to theatres and places of amusement only:—

8. The rows of seats in the auditorium shall be intersected by passages not less than 4 feet wide leading to the exits; side passages shall not be less than 2 feet 6 inches wide, and each row shall not contain a greater number than 10 seats for each passage by which it is bounded.

9. A safe and easy means of exit must be provided for the orchestra.

10. All rooms for performers must be constructed of non-inflammable materials, and provided with large and sufficient lobbies, and easy means of access to the street.

11. No gates shall be fitted up at pay-boxes unless they yield to the slightest pressure from within, and must not be fixed by any bolt or bar.

12. No building to be used as a place of amusement will be authorised where the pit is more than three feet above the level of the street.

13. No place of amusement capable of containing 1,000 persons or upwards shall be allowed to be built unless sufficient access can be obtained to it from at least two streets or lanes.

#### LIGHTING.

14. Every stop-cock shall be so placed as to be easy of access and near to the external walls.

15. Separate stop-cocks shall be provided for the stage, centre light of auditorium, side lights of auditorium, passages, and lobbies.

16. The meters for the stage and centre light of auditorium shall be controlled from the stage, the others shall be under the special charge of persons whose duties necessitate a constant attendance near the site of the meter.

17. Oil lamps or candles in lanterns shall be conveniently placed in all lobbies and staircases, and kept lighted during the performance, and one main gas-cock must be provided outside the building.

18. No white metal pipes for gas will be permitted to be used in any part of the building.

#### PREVENTION OF FIRE.

19. Every theatre shall be connected with the Central Fire Station by means of several electric alarms, placed in various parts of the house—one from the stage, and one on each floor.

20. Sufficient hydrants must be placed on each side of the stage in such positions that the scenery will not at any time prevent the free access to them, and not less than two hydrants shall be placed on each tier, convenient of access at all times.

21. Sufficient hose-pipe shall be provided for, and kept attached to, the hydrants, the hose to be suspended in open boxes free from all encumbrances, ready for immediate use in case of emergency.

22. Three pails, filled with water, shall be placed on each side of the stage behind the wings, and wet blankets kept ready for use during the performance.

23. A sufficient number of firemen shall be in attendance during performances; they shall make a daily inspection of the fire-plugs and other materials under their charge, and must be under similar superintendence and control as those of the Municipal Fire Brigade.

24. Employés must be instructed as to the position and the use of the fire-plugs.

#### EXITS, &c.

25. All entrance doors must be kept open; and all exit doors within the building must be perfectly free from anything which would prevent them from being opened at any time during a performance.

26. The words "Way Out" shall be conspicuously placed over both sides of egress doors, as also the number of the persons which each part of the house is seated for.

27. No articles, or anything which would in any way interfere with the movements of the public, to be placed in the corridor.

*Note.*—Numbers 3, 7, 11, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, and 27 of the foregoing regulations shall apply also to existing buildings.

### LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Monday Mr. J. A. Gotch read a paper on "English Houses in the Seventeenth Century." The lecturer said he would leave the broad path of history, and go down some of the by-way, and see the homes of statesmen and of men who made history in the days to which he referred. He invited his audience to enter the houses of noblemen and squires and people of the city, to see their domestic arrangements, the way in which the family lived, and the way in which the servants lived. They would find, he remarked, that the accommodation

in those days was very much the same as it was now, but that it was arranged in a much less convenient manner. Magnificence was the chief characteristic, and for this purpose a great deal of comfort was sacrificed. The lecture was illustrated by means of diagrams, one of which represented a palace built by the Earl of Dorset, who succeeded Lord Burleigh in the office of Lord High Treasurer; another illustrated the house of a squire of the time, such as Francis Tresham, who was implicated in the Gunpowder Plot, and a third showed the house of Sir Walter Raleigh. The lecturer quoted from the works of poets of the seventeenth century, thus bringing contemporary witnesses to give their evidence with regard to the home life of the period.

Mr. Edward Birchall, the president, who occupied the chair, said it was intended to have brought forward the question of the proposed incorporation of the society at that meeting, but the subject had been postponed.

### GLASGOW ARCHITECTURAL ASSOCIATION.

AT the last monthly meeting, the vice-president in the chair, a paper on "Local Building Stones" was read by Mr. R. C. Kerr, member. It was divided into two portions, the first an examination of stone in its original location from the standpoint of the geologist, chemist, and metallurgist; the second, stone, when employed in the building, considered practically.

In this examination over a score of different varieties, in common local use, and all found within forty miles distance of Glasgow, were reviewed. Of granites but little was said, as being more of an ornamental than really practical everyday building material. Sandstones, as almost exclusively employed, were treated on at length; and after a careful analysis of all the principal varieties within the area chosen, and taking into account the very different qualifications required for town and country atmospheres, Craigleith stone was considered most suitable for a manufacturing city such as Glasgow. Limestone was very seldom used unless in the form of mortar, for which purpose Arden quarries are most in repute, or at best but slightly as a decorative feature, like the cottage fireplaces of marble from Cambuslano, a village a few miles outside of Glasgow.

After an interesting discussion, opened by Mr. J. R. C. Honeyman, critic to the paper, a hearty vote of thanks was passed to the essayist.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### AN INTERVIEW WITH RUBENS.

One of the first of those connoisseurs who enriched England with examples of foreign art was Thomas Howard, Earl of Arundel. He was born in 1585, and succeeded his father in 1595. Several agents were kept by him in Greece, Italy, Germany, and the Netherlands, and whenever a relic of antiquity or a valuable example of art was met with they had instructions to purchase it. In this way his lordship secured 37 statues, 128 busts, and 250 inscribed stones, together with that valuable collection of gems which, having passed to the Marlborough family, was sold a few years ago at Christie's. The sculpture was presented to the University of Oxford by the Earl's grandson in 1667, and is known as the Arundel Marbles, but only one hundred and thirty-three of the inscribed stones escaped destruction in the Civil War, and the Parian Chronicle, which is the most valuable among them, was broken, one part having been used to repair a hearthstone. The Earl merits remembrance from architects, for he was the earliest to recognise the genius of Inigo Jones. The letter we now print was written on July 17, 1620, from one of Lord Arundel's agents in Antwerp, and it is doubly interesting from the reference to Vandyck:—

"Immediately on my arrival in this city, I presented your lordship's letter to Signor Rubens, the painter, who received and perused it with evident marks of satisfaction. I give you his reply:—'Although,' said he, 'I have refused to execute the portraits of many princes and noblemen, especially of his lordship's rank, yet from the earl I am bound to receive the honour which he does me in commanding my services, regarding him, as I do, in the light of an evangelist to the world of art, and the great supporter of our profession'; and, with other similar expressions of courtesy, he proceeded to make arrangements for her ladyship's sitting to him on the following morning: He has already sketched her likeness, with Robin the dwarf, the

fool, and the dog. The sketch, however, still requires some trifling additions, which he will make to-morrow; and on the following day her ladyship starts, with the intention of sleeping at Brussels. It so happened that, when Rubens began his work, he was unable to lay his hand on a piece of canvas sufficiently large for his purpose. Having drawn the heads, therefore, as they should be, he sketched the postures and draperies of the figures on paper, and finished a separate drawing of the dog; but he has ordered a canvas of the proper size to be prepared, and will himself copy what he has done, and send the copy, with the original sketches, to your lordship. He assures the countess that he will paint no person unless by your lordship's recommendation. Vandyck lives with Rubens; and his works are beginning to be scarcely less esteemed than those of his master. He is a young man of one-and-twenty; his parents are persons of considerable property in this city, and it will be difficult, therefore, to induce him to remove, especially as he must perceive the rapid fortune which Rubens is amassing."

#### BONOMI'S PROFESSIONAL CHARGES.

According to Noble, the employment of architects began to be systematised and the five per cent. rate introduced in the time of the Earl of Burlington, the amateur of whom Pope wrote. "It was usual to employ men for the different classes of work, and 'master artificers were not only distinct in their trade or calling, and invariably so employed, but also individually responsible for the due and proper execution of their respective works, at equitable and reasonable rates; but the architect and his assistants ascertained the quantities, and dated for, and determined the value of the various materials and labour.' Measurers were sometimes employed by the artificers as a protection against architects' errors, and it has been alleged that it was easy to obtain their services as witnesses in support of excessive charges. The first measurer ever remunerated by a commission on the value of work was a man named Hele, who flourished about the middle of the last century, and he is described by Noble as a very able and avaricious individual. From the existence of measurers the architect's position was rendered more difficult, and, in consequence, there was some variation in the profession with regard to fees. The scale that was issued by Joseph Bonomi, A.R.A., in 1794, is supposed to have been but one among several examples. He was an Italian, who assisted the Brothers Adam. As he was a relative by marriage of Angelica Kauffmann, he secured the influence of Sir Joshua Reynolds, and indeed the president resigned his office as well as his membership when he failed to have Bonomi elected an Academician. His best known work is *Roseneath*, Dumbarton, N.B., for the Duke of Argyll, and he was patronised by the English nobility. He died in 1808. The following is the scale:—

Terms of JOSEPH BONOMI, Architect, No. 76 Great Titchfield Street, London, January 1794.

##### No. I.

- Five per centum commission upon the whole expense of the building, labour, and materials, at London prices;
- For which B. makes the design, furnishes all the necessary working drawings, and four fair drawings, two plans, one front, and one section; makes the necessary estimate; and attends the execution of the work.
- If a clerk of the works is required (as he should be), he is to be paid by the employer.
- All the journeys, *to and from*, to be paid at the rate of eighteen pence per mile.
- If it should be desired, after the building is completed, to have it measured and valued, the expenses attending such measurement and valuation are to be paid by the employer.
- If the expense of the building exceeds the estimate given, then B. demands no more than the commission upon the amount of the given estimate, provided though that the overplus is not caused by additions and alterations in the design.

##### No. II.

- When it is only desired to have a design, with the necessary drawings for execution, &c., and an estimate, but without any attendance to the execution of the building, then such design, drawings, and estimate are to be paid at the rate of three per centum upon the amount of the estimate, at London prices.

##### No. III.

- If B. is called to settle some business, to give advice, to make additions, or alterations, &c., then B. demands five guineas per day, besides the journeys, paid as above; and, if any drawings are wanted after B.'s departure from the place, such drawings, valued at the rate of five guineas per day, are to be paid extra.
- After the design has been approved of, if any alterations, additions, or diminutions are required to be done, the neces-

sary drawings, requisite in making such alterations, &c., are to be paid extra, at the above rate.

In case that a design has been made, complete, and approved of, and another design in lieu thereof ordered to be made, then the former design is to be paid at the rate of three per centum, and the second at five per centum commission, upon the whole expense, as above, when executed by B. If not executed, then such second design also is to be paid at the rate of three per centum, as expressed by No. II.

#### SIR JOHN SOANE'S DESIGN FOR A PALACE.

In 1772 the silver medal of the Royal Academy was gained by John Soane, a bricklayer's son of the age of twenty, for his drawing of Inigo Jones's Banqueting-hall, and in 1776 he won the gold medal with a design for a triumphal bridge. Soon afterwards he was introduced to George III., through the kindness of Sir William Chambers, and he obtained an allowance of 60*l.* per annum for three years, with 30*l.* for travelling expenses to Rome, and at the expiration of three years 60*l.* for his return journey. It was natural that among the architectural visions of his student days (or, as Soane said, "among the wild effusions of a mind glowing with an ardent and enthusiastic desire to attain professional distinction in the gay morning of youth") there should be one of building a palace for so good a monarch. "No subject," he said, "can be more interesting to the architect, nor better calculated for the exercise of his skill and taste, than a palace for the sovereign. To unite the grand and the useful is a most difficult task; for whilst internal convenience requires several floors to be placed one above the other, external magnificence admits only of one floor, raised on a lofty and imposing basement."

The design which he made in Rome in 1779 is to be seen in that museum which is less visited than it deserves—Sir John's house in Lincoln's Inn Fields; and the following description of it was given in a book that was privately printed:—

"In composing this design, I laboured to avail myself of the advantages arising from the contemplation of the remains of the great works of the ancients, as well as of the observations and practice of the moderns. With these feelings, I endeavoured to combine magnificence with utility, and intricacy with variety and novelty. Vignola's celebrated palace at Caprarola suggested the general outline of the plan; and the villa of Adrian at Tivoli, the palace of Diocletian at Spalatro, the immense remains of the Imperial palace of the Cæsars in Rome, the baths of the Romans, and the interior of the Pantheon, with its superb portico by Agrippa—exemplars of magnificence, intricacy, variety, and movement, uniting all the intellectual delights of classical architecture—were objects calculated to call forth my best energies. The portico is copied from that of the Pantheon. In the centre of the building is a dome, under which is another, of a smaller diameter, leaving a space for the admission of light, after the manner of the "*lumière mystérieuse*," so successfully practised in the great Church of the Invalides and other buildings in France. The decoration of this interior dome, by aid of appropriate machinery, is designed to form a complete representation of the solar system. In making this design, besides the advantages already mentioned, I had frequent opportunities of showing the drawings in their progressive state to my honoured and lamented patron, the late Lord Camelford, then Mr. Thomas Pitt, and of making such alterations in them as were pointed out by the classical taste and profound architectural knowledge of that accomplished nobleman. This palace was proposed to have been erected in Hyde Park, with an extensive series of magnificent hotels, relieved by occasional breaks, bounding the park, improving its general appearance, and providing an ample fund to defray all the expense attending the completion of the design."

Sir John Soane might consider himself to be a successful architect, but one of his bitterest disappointments was the failure to obtain a commission for his palace. His loss had the effect of making him advocate the system of limited competitions. "If this course had been followed," he wrote, "instead of that monstrosity at Pimlico yclept Buckingham Palace, raised, to the disgrace of the nation, at an enormous expense, in a swamp surrounded with nuisances of a most disgusting character, we might have seen a royal palace erected on that elevated and salubrious spot, Constitution Hill." Sir John appeared to have no misgiving about the design which was likely to be selected.

Messrs. Archibald Smith & Stevens, of Janus Works, Queen's Road, Battersea, have been instructed by the Aerated Bread Co., to erect at their new premises, Eastcheap House, Eastcheap, one of Stevens & Major's Patent Hydraulic Balance Passenger Lifts, with their compensating apparatus for reducing the amount of water used. The architect of the building is Mr. George Edmonds, of Brompton Road, S.W.

### Architectural Competitions.

SIR,—At a meeting of the Council of the Society of Architects held this evening, it was determined to send the letter, of which a copy is enclosed, from the Competitions-Memorial Committee relating to various suggestions made by our Society with regard to architectural competitions, to the professional press. Therefore if you could find room to insert it, with this, in your next issue, you would oblige,

Yours, &c.,  
G. A. T. MIDDLETON,  
Secretary of the Society of Architects.

January 13, 1885.

[COPY.]  
Competitions-Memorial Committee,  
9 Conduit Street, Hanover Square, London, W. :  
December 9, 1884.

SIR,—In reference to our interview on Thursday last, when Mr. Hugh Roumieu Gough and yourself attended our Committee as a deputation from the Society of Architects, we have to inform you that while our Committee agree with you in thinking that the adoption by promoters of competitions of many of your suggestions is desirable, they do not consider the present an opportune time for pressing them, the main point—viz., that of the appointment of an architectural assessor—being as yet not so universally accepted as to justify our Committee in pressing for additional conditions which might but imperil the adoption of the main point. Our Committee, however, are so impressed with the desirability of your suggestion (from the point of view of all parties) of the second advertisement after questions have been put, that they propose to add this to their communications to promoters. Thanking you for your suggestions, and the interest you have taken in the matter,

We are, Sir, yours faithfully,  
(Signed) HENRY CURREY,  
COLE A. ADAMS,  
ASTON WEBB.

To G. A. T. Middleton, Esq.,  
Secretary of the Society of Architects.

### Utilitarianism in Education.

SIR,—I am afraid that my inoffensive letter asking for information has made Mr. Harvey more angry than befits the pupil of a philosopher. I hope it may pacify him to learn that his last letter has checkmated me. Mr. Harvey proposes that you should illustrate one of his own works as an exemplification of what Semper's principles have done for him. I am sure that the view will be studied with interest and kindly feeling, but for my part I must decline to criticise it. An architect so often has to submit to the caprices of clients that the executed work does not always correspond with the original design, and I have known architects who have been more severe than a newspaper critic when they spoke of their own buildings. Custom has recognised the principle of reticence with regard to the work of living architects, and it is well to remember the maxim of Sir Henry Wotton, that it is "almost harder to be a good censurer than a good architect."

But Mr. Harvey's own letter seems to me to be a confirmation of what I wrote. I was sceptical about the utility of Semperism, and I find that Mr. Harvey acknowledges that he has strayed beyond his master's leading-strings; and, so far as I understand his letter, he believes that it is the tendency of Semper's teaching to make man free. In other words, that rigorous system (which may be termed fatalism applied to art) drives men who are artists into revolt. If so loyal and enthusiastic a disciple as Mr. Harvey has shown himself to be finds it more satisfactory to himself to produce forms of which his master could not approve, what is the advantage of Semperism as a system of art teaching? It may be called the philosophy of art, or the romance of art, or what not, but I have yet to learn how it increases a student's powers and enables him to design better buildings. Until that can be done I am entitled to my own opinions.

I have been asked by Mr. Harvey whether I should object on utilitarian grounds to the conversion of the "Principia" into a handbook for students, and I have no hesitation to answer in the affirmative. The "Principia," if one may judge from what has been said of it, testifies to the power of the human intellect; it is a sort of extraordinary high-tide mark in mental history, and Newton is justly entitled to be revered while the world lasts. But is it not one of those books which in the present state of things may be read by deputy? Herschel compares Newton's geometry to the bow of Ulysses, which none but its master could bend. Still, the influence of Newton is very widely extended in science, and I dare say we are all the better for him. His book is an excellent exercise, and a student who could comprehend easily the mathematics of the "Principia" need not fear to grapple with a stiff book on construction. But

the training and intellect that are necessary for the feat are not vouchsafed to all of us, and I must frankly say that I have not found mathematicians of a high order to be such wonderful fellows when they had to deal with this work-a-day world. I have had some experience of the son and pupil of one of the greatest mathematicians since Newton's time. He had all the sublimities of the science at his fingers' ends, but he could not be depended on to work out very simple problems in quantity-taking with accuracy. His thoughts may have taken an extremely wide sweep before they reached the dimensions with which he had to deal; and although it was flattering to think that one's simple work had undergone a transforming process, still, in a push for time, it was rather embarrassing.

I have occupied so much of your space, because I consider that just now it would be well if students applied the test of utility to the educational schemes which are being concocted for their edification. It would be a consummation devoutly to be wished if everyone was equal to such a test as that in the programme which was issued by the Institute in 1862. But how many among the architects who have been most successful would care for the test? Is it quite certain that the whole of the Council of the Institute are qualified to answer all the questions in that and similar programmes? What is more important, is there any certainty that the majority of clients would set a higher value on an architect who had the "Principia" and "Der Stil" by heart, and is it not more likely that to the average British mind a book on the strength of materials would seem better worth attention? One class is proclaiming architecture to be a fine art, and a man who wishes to erect a building concludes that in an architect's hands it will become as much an object of luxury as a costly marble statue, and as ill-adapted to use. Builders and engineers, foremen and measurers, who form a second class, tell him that they think mainly of convenience and economy, but that they can give him as much ornament as he wishes. Every day adds to the evidence that the chances are in favour of the building going to some one among the second class. At such a time will Semper and Newton bring back clients, or counter-balance the reputation for practicality which engineers have contrived to gain?

Yours obediently,  
CUI BONO.

### CHURCH-BUILDING AND RESTORATION.

**Rhyl.**—The memorial-stones of a Congregational church have been laid. The building will comprise church to seat 600, with lecture-hall to seat 400, this latter to be thrown open to the church if required. The style of the building is Early English. The walls externally will be faced with limestone parpoints from the Graig Quarry, Denbigh, relieved with freestone dressings from the quarry of Messrs. Williams & Davies, at Gwespyr. The architect is Mr. Owen Edwards, of Rhyl. Messrs. Foulkes & Son, of Rhyl, are the contractors.

**Manchester.**—Plans have been prepared by Mr. Henry Charlewood, architect, of Manchester, for the proposed new mission church, St. Aidan's, in the parish of Christ Church, Bradford-cum-Beswick. The new church will contain between 400 and 500 sittings.

**Leith.**—A United Presbyterian church, capable of accommodating 1,070 persons, is to be erected for the Kirkgate congregation. From competitive plans sent in, those of Messrs. Shiells & Thomson, architects, George Street, Edinburgh, were selected, the designs being in the Italian Romanesque style. Accommodation will be provided for 594 persons in the area of the church, 437 in the gallery, and 40 in the choir seats. A hall is also to be erected capable of accommodating 480 persons, in addition to class-rooms, vestry, and cloak-rooms. The estimated cost of the buildings is 4,800*l*.

**Diocese of Newcastle.**—The first annual meeting of the subscribers to the Bishop of Newcastle's Fund for Church Extension on Tyneside, was held on Monday. The Duke of Northumberland presided. The report of the committee stated that last year the Commissioners appointed to inquire into the wants of the district recommended the formation of 12 new parishes, with 11 new churches, and 14 additional mission-rooms. The amount required for building was 80,000*l*., and of this the sum of 39,461*l*. had been paid or promised.

### SCHOOL BUILDINGS.

**Todmorden.**—An infants' school-room and class-room have been added to the National Schools, Todmorden, and was opened on New Year's Day; they provide for 150 infants. The walls are faced with local sand-stone. The whole of the joiner work is of pitch-pine. The works have been carried out from the designs and under the superintendence of Mr. Jesse Horsfall, architect, of Todmorden, by the following contractors:—Atkinson, mason; Sutcliffe, joiner; Barnes, slater; Whittaker, plumber; Blacka, plasterer.

**Todmorden.**—New schools are to be erected for the Primitive Methodists at Knowlwood, Todmorden. The style is Romanesque (in keeping with the existing chapel adjoining), and will be faced with Yorkshire parpoints and Yorks dressings.

**Elgin.**—Plans for a new school have been approved by the Elgin School Board. The plans have been prepared by Messrs. A. & W. Reid, architects, of Elgin. The building will accommodate 350 scholars, and will cost about 4,500*l*.

**Padgate.**—A school erected near the Padgate Industrial School has been opened. The building will be used for school purposes on Sundays. It is built of Knutsford grey brick, relieved with red-pressed brick and terra-cotta, and will accommodate 100 children. The work has been carried out by Mr. Richard Beckett, contractor, of Hartford, from designs by Mr. William Owen, architect, Warrington.

**Sowerby Bridge.**—A Baptist school chapel has just been opened. It is built of stone, and accommodation for more than one hundred persons has been provided. The wood-work is of pitch-pine. There are two class-rooms, each 11 feet by 10 feet 6 inches, and kitchen with heating apparatus, &c. Mr. W. H. D. Horsfall, Halifax, is the architect.

**Glasgow.**—A Board school, erected at Townhead, has just been opened. It has been erected from the designs of Messrs. Baldie & Tennant, architects, Glasgow. A janitor's house and play-shed for infants have, by utilising the rapid fall of the ground eastwards, been got under the school. Spacious playgrounds are provided. The cost of the buildings is 14,564*l* 10*s*., which for 1,385 scholars gives 10*l* 10*s* 4*d*. per scholar, but the Board have provided the 10 square feet accommodation for 242 additional scholars, making in all accommodation at 8 and 10 square feet for 1,627, and in this view the cost is 8*l* 19*s* 0*¼d*. per scholar.

## ART SCHOOLS.

**Birkenhead.**—The prizes in this school were lately distributed by the Bishop of Chester. His lordship said that every work of art ought to subserve those three ideals—the good, the beautiful, and the true. If he had the choice of being a poet, a musician, or an artist, he should not hesitate which to choose. He was sure that the artist had a great advantage over the poet, and certainly he stood on an equality with the musician, and his works should conduce to good more than the other two. Art was not now peculiar to the rich, or people of æsthetical proclivities, but in almost every cottage they saw that the furniture, lamps, and chairs were made of a better pattern than heretofore, and some idea of beauty seemed to be making its way through the whole fabric of intelligent English society. Schools of art in England had not only raised the tone of refinement, and improved the pattern of things, but in some instances had been the means of leading to the foundation of great works. He believed that art, when it devoted its attention to the production of the beautiful, the good, and the true, was one of the greatest agencies by which modern society was raised and purified. The good, the beautiful, and the true must go together. He looked upon art as a discipline, in the cultivation of which patience and perseverance were required to produce accurate work, and this could not be attained without constant care and attention.

## GENERAL.

**A Slade Professor of Fine Art** will be elected at Cambridge on February 11, 1885. The office is held for three years, and the stipend consists of the dividends on 12,000*l*., invested in the funds.

**The Triennial Exhibition** of the Rotterdam Academy of Fine Arts will be opened on May 31, and closed on July 12.

**The Brussels Pavilion**, at the Antwerp International Exhibition, will contain 1,800 square metres.

**The Paisley Town Council** have agreed to offer free the site of a house in High Street to the directors of the School of Art, as a portion of the site required for the New School of Art, on condition that the Council be allowed a reasonable control in the management of the Institution, and failing the offer being accepted, to sell the site to the directors at the cost paid by the Council for the property in 1878.

**The Brander Library**, Huntley, was opened on Tuesday. It is the gift of Mr. William Brander, of the London Stock Exchange, to his native town.

**A Bath-Room Suite**, magnificently fitted, and intended for the ex-Khedive of Egypt, has been manufactured by Messrs. Conolly, Hampstead Road, N.W. The bath is the "Acme Spray," but has several additions to the ordinary bath of that name. The room will also contain a self-acting tip-up lavatory, of novel arrangement, which has been specially designed.

**A Pension** of 80*l* has been awarded to the granddaughters of Sir Henry Raeburn, the Scotch portrait painter.

**A Bust of Sir David Brewster** has been purchased by subscription for Jedburgh, his native town. It is the work of Mrs. D. O. Hill.

**Mr. Alan Danvers** has been knighted by the King of Portugal for his services in the installation and working of the telephone in Lisbon.

**M. Frédéric Baudry**, a member of the Academy of Inscriptions, and director of the Bibliothèque Mazarine, died lately in Paris at the age of sixty-six years.

**A Committee** has been formed in Paris for the relief of the sufferers by the earthquake in Spain. The Spanish Ambassador is president, and among the members are MM. Raymond de Madrazo and de Méliá, the painters.

**A Medal** has been designed by Mr. Poynter, R.A., and executed by Mr. Allan Wyon, which is intended to serve as a memorial of the founding and endowment of the Whitworth Scholarships by Sir Joseph Whitworth. The Lords of the Committee of Council on Education have authorised the issue of a copy of this medal to each of the scholars who have held scholarships and have gone through the prescribed course satisfactorily. Scholars, or the legal representatives of such as are dead, are requested to inform the Secretary of the Science and Art Department at South Kensington of the address to which their medals should be forwarded.

**Dr. Ferrers**, the Vice-Chancellor of Cambridge University, has stated that the exhibition of portraits extending to the year 1602, lent to the Cambridge Antiquarian Society by the liberality of the University and of the several colleges, has excited so much interest that it justified the hope that similar exhibitions embracing later works of art might be repeated in subsequent years.

**A New Reredos** has just been erected at St. Austin's Catholic Church, Stafford, from the designs of Messrs. Pugin & Pugin, of Westminster, by Mr. Wall, of Cheltenham.

**M. Victor Hugo** is said to have purchased a site near his present residence in Paris, on which he proposes to build a house from his own designs.

**The Subway** between the South Kensington Station and the Exhibition buildings has been commenced.

**Mr. Alfred Meeson**, architect of the first Alexandra Palace, died at his residence, No. 4 Harley Road, South Hampstead, on Monday last, in his seventy-sixth year.

**The Italian Church**, Hatton Garden, has just been lighted with the albo-carbon light by the Sanitary Engineering and Ventilation Co. of Westminster, who also recently applied the same system of lighting to the New Oratory, South Kensington, several picture galleries, &c.

**Mr. Banister Fletcher** has been appointed assessor in the competition for the new Baptist Chapel at Hendon.

**A Congress of Electricians** is proposed to be held in St. Petersburg, the city in which the earliest attempts were made to employ electricity as a motive power, for a vessel on the Neva. What is contemplated is the application of electricity to railway trains.

**An International Exhibition** will be held in Königsberg during the months of May to August. It is to comprise the following classes:—1, motors; 2, transmission appliances; 3, tools and implements for all branches of manufacture; 4, chemical and physical apparatus; 5, apparatus for technical education; 6, safety and protective appliances; 7, machinery and appliances for household purposes and for innkeepers; 8, agricultural implements and appliances. The exhibition takes place under the authority of the Industrial Central Union of the province of East Prussia.

**Messrs. Doulton** have been awarded the gold medal at the New Orleans Exhibition for their art pottery.

**Plans** for enlarging Melton Asylum have been approved of, and Messrs. Giles and Gough have been instructed to get tenders for the work.

**The Promoters** of the Manchester Ship Canal Bill have deposited the sum of 299,600*l*. in Consols with the Accountant-General in Chancery, as the Parliamentary deposit required by the Standing Orders. It is the largest sum ever deposited by promoters of any private bill.

**St. David's College**, Lampeter, is to be enlarged, and it is expected that the first stone of the new buildings will be laid in June.

**A Public Hall** is to be erected in Linlithgow by a joint-stock company. A site has been purchased having a frontage of 92 feet, and a depth of 100 feet.

**A Goods Station** is about to be erected on the North British Railway at Alloa by Messrs. Cousin, of that town. Plans are in preparation for a passenger station.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JANUARY 17, 1885.

## BUILDING MATERIALS.

THE Circular of Messrs. Churchill & Sims states that the quantities in loads of wood imported into the United Kingdom, since 1879, were as follows:—1879, 4,716,497; 1880, 6,310,031; 1881, 5,653,810; 1882, 6,320,863; 1883, 6,597,427; and 1884, 6,132,925; showing that the demand of the country has been smaller than in either 1883 or 1882. A still larger reduction is seen in the value of the importation, which amounted to £14,464,743 only in 1884, against £16,647,606 in 1883. The wood trade of the country could not have been prosperous with prices steadily tending downwards from the commencement to the end of the year. With reference more particularly to London, the trade has been of a very uneventful character, but less satisfactory than that of the two years immediately preceding it, for no great losses have been experienced either on stocks or by bad debts; on the other hand, such profits as have been made are meagre in the extreme, representing little more than bare commissions, or occasionally a larger percentage for dealers, who have had the advantage of buying at the public sales at the lowest rates on record. Speaking generally, it may be said that the extreme cheapness of the production, combined with the lowest freights ever known, has just enabled the trade to pay its way, and to find itself at the end of the year in no worse position than at the beginning, but without having regained any of the strength or credit lost in the three preceding years. The surest sign that it has borne a full share of the prevailing depression is that for the first time a great reduction in price has failed to increase the consumption.

ACCORDING to Messrs. Joseph Brindley & Co.'s Circular, the recent rise in prices shows that the long-continued depression in the slate trade appears at last to be approaching a close, the steady improvement in the export trade (which was anticipated in the last year's report) being the principal cause, and there is every prospect of this demand improving further. In the Bangor district the make has been about the average of previous years; but in the Festiniog district there has been a falling off of about 5,000 tons, while the heavy falls of rock in several of the quarries (in one case accompanied by serious loss of life) will cause the make for the coming year to be still further reduced, and so tend to keep up the present improved prices. The importation of foreign slates continues very small, and the reduction of the heavy protective duty in the United States will no doubt lead to a renewal of the export trade with that country, so that the prospects of the trade are better than they have been for many years.

MESSRS. FALLOWS & Co. say that the iron trade last year will be remembered as a period of prolonged and unrelieved depression, coupled with considerable contraction in the volume of business and a further fall in prices. The cause is not difficult to discover. For many years past the iron trade of the world has been subject to periods of expansion and contraction, mainly due to those sudden outbursts of railway exten-

sion so common in the United States, and it can only be hoped that the severe experience of the past may prevent a repetition of similar mistakes in the future.

## VENTILATION OF PUBLIC BUILDINGS.

MESSRS. ROBERT BOYLE & SON, Ventilating Engineers, 64 Holborn Viaduct, and Glasgow, are at present applying, and have applied, their Self-acting Air-pump Ventilators and system of ventilation to the new Tabernacle, Auckland, New Zealand, being built for the Rev. Mr. Spurgeon; St. Andrew's College and Asylum, Algoa Bay, Africa; Waddesdon Manor, residence of Baron de Rothschild; Aston Clinton, Tring, residence of Lady de Rothschild; Craig-y-Nos Castle, Wales, residence of Madame Adelina Patti; Walton House, Wilton, residence of Lord Pembroke; residence of the Duke of Cleveland, Bath; residence of Earl Grey, Howick; Euston Hall, Thetford, residence of the Duke of Grafton; New Post Office, Boston; Reform Club, Delph; Literary and Scientific Institute, Ebbw Vale, Mon.; St. Pancras Workhouse; County Police Station, West Hartlepool; New County Court, Nottingham; New Hospital, Douglas, Isle of Man.

## GAS AND ELECTRIC-LIGHT FITTINGS.

ONE of the new catalogues which have been prepared by Messrs. EVERED & CO., LIMITED, of Birmingham and London, suggests the importance which electricity has already reached. Brass fittings are now available to suit every purpose for which the light can be used, and thus we see simple pendants for single or double-burners in shops, brackets, wall-lights, and electroliers for five or more lights. They have been all designed so as to bring the burner into unity with the remainder of the work—a condition that is not always recognised. The catalogue of gas-fittings shows the richness and vigour that are associated with the name of Evered & Co. The gauntness that is too often found in metal-work is eschewed. With Renaissance surroundings those gaseliers would be especially appropriate; but Messrs. Evered produce work in every style, and carry out architects' designs with fidelity. In case some of our readers who are amateurs should apply to the firm for manufactures, it is as well to state that Evered & Co., Limited, only sell to those who sell again.

## MOSAIC AND PARQUET PAVEMENT.

MR. JOSEPH EBNER, of Clerkenwell Road, London, has lately laid a handsome marble mosaic pavement in the aisles and chancel of St. Mary's Church, Chipping Norton, with Irish fossil steps to the latter. Marble mosaic pavement has also been fitted in the porch of the residence of Mr. Panmure Gordon at Brighton, the design being unique and treated effectively in Chinese character; also in the hall at the Duke of Marlborough's, Queen Anne's Gate, S.W. Parquet floors have been laid at the new Stock Exchange,

and in the Middlesex Hospital extension the hydrofuge parquet floor, which is sound and fireproof. Mosaic pavements have been laid at Humphreys Hall, Knightsbridge; the elaborate oak doors there are also the work of Mr. Ebner. The use, for the first time we believe, of mosaic in connection with pavement lights is highly satisfactory.

## IRON GIRDERS.

MESSRS. MEASURES BROS. & Co. have again issued their Card Almanack, containing a view of the ruins of the building in Cheapside after the fire of 1881, when it was demonstrated that rolled iron joists, if of good quality, can withstand an amount of heat to which other materials succumb. The card is also interesting on another account. There is a view, taken from a photograph, of Messrs. Measures' extensive premises, showing their enormous stock of girders and rolled iron of all sections, weights, and lengths, and which is the more remarkable as being found in London. The supply is sufficient for the demands of a larger area than that of the Great Metropolis. It is unnecessary to enlarge on the advantage to builders of having such a stock as is found in Southwark, for by means of it there need be none of those delays which occur too often when orders are given to firms who are dependent on foreign supplies. So large a quantity of English joists is satisfactory evidence that the rolling mills in the Midlands have not yet been superseded.

## IRON CASEMENTS.

THE unpretending trade list of Messrs. Burt & Potts runs the risk of being overlooked amidst the showy catalogues which arrive in every architect's office. But it contains information that is always useful, for it is needless to say that the iron framing which this firm has made a speciality is always in request, and it is well to have particulars at hand. Messrs. Burt & Potts' casements have the advantage of being strong without being heavy. They can be adapted to suit buildings large and small, in all styles of architecture, and by the aid of an ingenious system of fastening they can be made as secure as if casement and frame were in one piece.

## WOOD-BLOCK FLOORING.

MR. ROGER L. LOWE, of Farnworth, near Bolton, has just completed laying his improved wood-block flooring at the following buildings:—Lydiard House, near Swindon; corridors and council chamber, at Hyde Town Hall, Messrs. J. W. & F. R. Beaumont, architects; Underwood, Buxton, Messrs. Mills & Murgatroyd, architects; Hanley Town Hall, Mr. J. Lobley, surveyor; Girls' High School at Exeter, Messrs. Hayward & Son, architects; New Mission Hall, Swindon, Mr. O. Baker, architect; Armathwaite Hall, Cockermouth; Bull Hotel, Wakefield, Mr. W. W. Watson, architect; dispensing-room, Beckett's Hospital, Barnsley, Messrs. Dixon &

Moxon, architects; Turner's Memorial House, Liverpool, Mr. A. Waterhouse, architect, London; St. Germans Church, Cardiff; Walford Schools, Walford, Herefordshire; Restaurant, Hatchett's Hotel, Piccadilly, W.; Parish Church, Llanrwst, Messrs. Paley & Austin, architects; Memorial Chapel, Nantwich, Mr. T. Bowers, architect; Hope Church, near Mold; dining and drawing-rooms, for Messrs. Weeks, builders, Whitechurch, Hants; Baptist New Schools, Nantwich, Mr. T. Bowers, architect; St. Elvan's Church, Aberdare, Mr. T. L. Edwards, architect; aisles of Lindfield Church, Sussex, Mr. Somers Clarke, London; 20 Bolton Street, Piccadilly, London; Old Alhambra, Nottingham, Messrs. Trumann & Pratt, architects; hall at Weybridge, for Messrs. Williams & Gale, architects; dining-hall, Woolwich Arsenal, for Lieutenant-Colonel H. D. Crozier, R.E.; Werrington Church, near Peterborough, Mr. J. E. Traylen, architect; new schools, Swindon, Wilts, Mr. W. H. Read, architect; waiting-room, Leamington Station, Mr. H. Woodhouse, C.E.; fixing parquet border (by Trollope, London) in Lowe's patent composition on fire-proof floors in magistrates' room, Sessions House Liverpool, Messrs. F. & G. Holmes, architects.

## AUCTION SUMMARY.

For the Week ending January 24.

MONDAY, 19th:—

Mr. Henry Benningfield.—Freehold Building Land, Enfield.

Messrs. Inman &amp; Co.—Freehold Land, with Buildings.

TUESDAY, 20th:—

Messrs. Horne, Eversfield &amp; Co.—Marble Chimney-pieces, &amp;c.

WEDNESDAY, 21st:—

Mr. Bradshaw Brown.—Kilns, Offices, Cart-house, and Vacant Land, Mile End.

Messrs. Henry Oughton &amp; Son.—Builders' Yards, Workshops, Stabling, and Offices, South Kensington.

FRIDAY, 23rd:—

Mr. Robert Reid.—Freehold Building Site, Paternoster Row.

Mr. Robert Reid.—Freehold Building Land, Hendon and Kilburn.

## COMPETITIONS OPEN.

CHELSEA.—Feb. 25.—Plans are invited for Additions to the Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, Clerk of the Vestry, King's Road, Chelsea.

CROYDON.—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100%, 30%, and 25% for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

BRADFORD.—Jan. 20.—For Building Residence, Barker End Road. Mr. J. Ledingham, Architect, 1 New Ivegate, Bradford.

## R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

## INEXPENSIVE &amp; PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

Barnstable . . . . .  
Belfast and 10 miles round . . . . .  
Bournemouth and 10 miles round . . . . .  
Brighton and 8 miles round . . . . .

**LUDLOW.**—Jan. 31.—For Building Master's House and additional Schoolroom to Gravel Hill School. Plans by the Architect, Mr. J. Farmer, at the Rectory, Ludlow.

# RENDLE'S "ACME" GLAZING

(REGD)

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

## SALES BY AUCTION.

**FOY, MORGAN & CO.** beg to announce that their next PUBLIC AUCTION will take place on

FRIDAY, FEBRUARY 6, 1885,

at the **BALTIC SALE-ROOM**, Threadneedle Street, E.C., when they will offer their usual assortment of **DEALS, BATTENS, BOARDS, TIMBER, &c.**

Catalogues will be issued in due time.  
**FOY, MORGAN & CO.** { Wood Brokers, 108 Bishopsgate Street Within, E.C.

**UPPER THAMES STREET, E.C.**—To Builders, Marble Masons, and Others.—Absolute Sale of Marble Chimney-pieces, &c. (in consequence of the Premises having to be given up at Lady Day).

**MESSRS. HORNE, SON & EVERSFIELD** are instructed by Mr. George Mitchell to **SELL** by AUCTION, on the Premises, No. 148 Upper Thames Street, E.C., on Tuesday, January 20, and following day, at Twelve for One o'clock precisely each day, the whole of the valuable STOCK of very handsome **CHIMNEYPIECES** and **FENDERS** in Statuary, Sicilian, Blanc P. Sienna, Brun Brecht, Italian Grotto, Bardilla, Black, Rouge Royal, St. Ann's, Vein, and other Marbles, in every variety of designs suitable for builders of every class of house; a large selection of kitchen ranges and tile grates by the best makers; and a well-assorted stock of 3-inch and 1-inch tiles, &c.—May be viewed one week prior to Sale, and catalogue had on the Premises; also at No. 166 Brompton Road, S.W.; and of Horne, Son & Eversfield, 17 Great George Street, S.W., and 80 Fore Street, E.C.

To Builders and Others.—Hendon.—Valuable Freehold Land with buildings thereon, comprising two cottages, barn, and stable, producing, when all are let, £38 4s. per annum, less some small outgoings. Well situated in the above beautiful locality, in main road at the corner of Colin Deep Lane, the Burroughs and near station.

**INMAN & CO.** will OFFER by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Monday, January 19, at One, the above valuable PROPERTY.—Particulars and conditions of sale at the Mart; of Messrs. Smith, Stenning & Croft, Solicitors, 70A Aldermanbury; and at the Auction Offices, 126 Maiden Lane.

**BERMONDSEY WALL POTTERIES**, fitted with Kilns, Plant, and Machinery, with possession, together with the Goodwill of the old-established Business for the Manufacture of Stoneware Drainpipes, Chimney-pots, &c.

**MESSRS. FULLER, HORSEY, SONS & CASSELL**, are instructed by the Executors of the late Mr. Henry Millichamp to **SELL** by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on Wednesday, January 21, 1885, at One precisely, in One Lot, the valuable PREMISES, known as the Bermondsey Wall Potteries, situate No. 58 Bermondsey Wall, occupying an area of about 21,500 square feet, part freehold and part leasehold. The freehold portion has a frontage to Salisbury Street, and comprises a substantial brick-built factory of three floors, with kiln, covered store adjoining, and large yard. The remainder of the premises consists of a spacious factory, with two kilns, and two pairs edge-runners, steam-engine and boiler-house, with horizontal steam-engine and boiler, chimney-shaft, stabling, dwelling-house, and yard, held for an unexpired term of about forty-one years, at a rental of £240 per annum; also a factory adjoining, with two kilns and dwelling-house, held for an unexpired term of about two years, at a rental of £40 per annum. May be viewed by orders, to be obtained at the Auctioneers' Offices, and particulars had of A. Calkin Lewis, Esq., Solicitor, 7 Furnival's Inn, E.C.; Samuel Dyer Nix, Esq., Chartered Accountant, 3 King Street, Cheapside, E.C.; at the Mart and of Messrs. Fuller, Horsey, Sons, & Cassell, No. 11 Billiter Square, E.C.

Leytonstone, close to the Station on the Great Eastern Railway.

**MR. GEORGE B. SMALLPEICE** has received instructions to **SELL** by AUCTION, at the Mart, Tokenhouse Yard, Bank of England, on Thursday, January 29, at Two precisely, **FIFTEEN PLOTS** of **FREEHOLD BUILDING LAND**, situate in the Fairlop, Filbeck, and Bulwer Roads, with frontage amounting to 550 feet. Also the Freehold Residence in Fairlop Road, known as Albany Villa. The land is exceedingly well placed, within 30 minutes' ride of the Metropolitan, to which there is a constant and regular service of trains; it is well adapted for the erection of villas of a superior description, and which, from their easy access, would readily command a desirable class of tenants. The residence may be viewed with the permission of the occupier.—Particulars may be obtained of C. B. Cooper, Esq., Solicitor, 40 Bedford Row, W.C.; at the Mart; and of George B. Smallpeice, Surveyor and Auctioneer, 9 and 10 Tokenhouse Yard, Lothbury, E.C.; and Guildford.

**BEXHILL-ON-SEA.**

Between St. Leonards and Eastbourne, with Railway Station on the Estate.

**MESSRS. E. & H. LUMLEY** beg to announce that the extensive improvement works which have been carried on at a cost of about £50,000 are now complete, and invite the attention of builders, contractors, and capitalists to the valuable sea frontage now ripe for buildings. Leases will be granted on easy terms, and every facility afforded for developing this very promising seaside town.

Plans and particulars may be obtained of Lumleys, agents to the freeholder, the Right Hon. Earl DE LA WARR, at 21 St. James's Street, Piccadilly, S.W.

**VAUXHALL.**

On the Albert Embankment, in close proximity to the river. A Freehold Building site of about 12,500 square feet, with extensive frontages to the road and pathway of the Embankment, close to Messrs. Doulton's Potteries and other large factories, eminently suitable for the erection of a warehouse, Public Hall, or business premises requiring space and a prominent and commanding position unequalled in the district.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** are instructed to offer for **SALE** by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Thursday, February 12, 1885, at 2 o'clock, the above valuable **FREEHOLD BUILDING SITE**.

For particulars apply to H. E. Brown, Esq., Solicitor, 22 Great George Street, Westminster, S.W.; or to Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, and 18 Old Broad Street, E.C.

Sale of Plant and Surplus Stock.—Terra-cotta Works, Mapli Street, Mile End Road, E.

**MR. BRADSHAW BROWN** will **SELL** by PUBLIC AUCTION, on the Premises, as above, on Wednesday, January 21, 1885, at Eleven for Twelve o'clock, a 6 H. P. **PORTABLE ENGINE**, shafting, wash, pug, and mortar mills, with edge runners, garden-tile press, quantity of spandril steps, figures and artistic statuettes, fountains, Greek amphora and garden vases, quantity of geometrical and garden tiles, moulds, casts for studio purposes, and other items.—Auctioneer's Offices, 59 Fenchurch Street, E.C., and Estate Offices, Millwall, E.

**MAUCHLINE.**—Jan. 24.—For Cutting Bars-kimming Brae and Building Retaining Walls in connection. Mr. James M. Pearson, C.E., Kilmarnock.

**MIDDLESBROUGH.**—Jan. 21.—For Building Engine House, &c., for Hydraulic Machinery at Docks. Mr. William Bell, Architect, Railway Offices, Northgate, Darlington.

**MIDDLESBROUGH.**—Jan. 24.—For Cast and Wrought Ironwork for Erection of Nine Through Beds of Retorts. Mr. E. D. Latham, Gas Offices, Middlesbrough.

**MIDGLEY.**—Jan. 28.—For Building Shed (59 yards by 34 yards), together with Store-room, Subway, and Appurtenances, at Oats Royd. Mr. T. Lister Patchett, Architect, George Street Chambers, Halifax.

**WIGAN.**—For Building Block of (ashlar) Business Premises, Shop, Offices, and Restaurant. Messrs. Isitt & Verity, Architects, Wallgate, Wigan.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"Sir,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy." "Yours, &c.

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.  
Works—TYLDESLEY, near MANCHESTER.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 8d. per cwt. more than the price of the ordinary Common Iron Cut Nails.  
The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.  
These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## INTERNATIONAL HEALTH EXHIBITION, LONDON, 1884.

GOLD, SILVER, and BRONZE MEDALS were awarded to

**BUCHAN'S****PATENT SANITARY AND VENTILATING APPLIANCES.**

EASTBOURNE EXHIBITION, Oct. 1884.—"Special" Certificate of Merit (Highest Award) was granted to Buchan's Patent Ventilators and other Sanitary Exhibits.

GOLD MEDAL

When tested in London by Mr. S. S. Hellyer, BUCHAN'S INDUCED CURRENT FIXED VENTILATORS excelled all the other leading makers' Cows and Ventilators by 91,000 feet in twenty-one hours—and is still the Champion.

"The Best Cow is one of Mr. Buchan's."—"Ventilation and Heating," by Dr. BILLINGS.

J. MURRAY ROBERTSON, Esq., Architect, Dundee, on Nov. 8, 1884, writes:—"I have great pleasure in adding my testimony to the merit of your Ventilators. I have now used a very large number of them, and have found them to work admirably."

"W. P. BUCHAN, Esq.—SIR,—Your Disconnecting Traps and Ventilators and also the Grease Traps have given the utmost satisfaction here since they were introduced."

"Balmo'al: Nov. 27, 1884. "JAMES ANDERSON, Clerk of Works."

ILLUSTRATED PRICE LISTS FREE FROM

**W. P. BUCHAN, Sanitary Engineer, 21 Renfrew St., GLASGOW.****BELLMAN'S PATENT GULLY.**

This Gully possesses the following advantages:—

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.****Avoids all Splashing.****Ventilates the Pipes and Trap.****Forms Drain for Area or Surface.****Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.****PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

### TESTIMONIALS.

From J. E. BOEHM, Esq., R.A.:—"Having for over ten years used myself, and recommended to my patrons, your excellent Pedestals, I can safely say that I consider them the best that have come within my knowledge, and I therefore can in every respect highly recommend them."

From C. B. BIRCH, Esq., A.R.A.:—"Having dealt with you for a long period of years, it gives me great pleasure to testify to the excellence of your Pedestals and the prompt and courteous manner in which your business is conducted. I may also add that the late J. H. Foley, Esq., R.A., with whom I was long associated, held your firm in high esteem."

From THOS. BROCK, Esq., A.R.A.:—"I have much pleasure in testifying to the beauty and excellent quality of your Pedestals. An experience now extending over several years convinces me they are the best obtainable."

## BELLMAN & IVEY, 95 Wigmore Street, London, W.

# The Architect.

## THE WEEK.

THE American ambassador, in his speech at the Society of Arts on Wednesday, referred to what had been said by Sir HENRY WOTTON, that ambassadors were people sent abroad to lie for the good of their country. The reputation of one of the earliest English writers on architecture is of consequence, and it is not to be supposed that WOTTON was a liar or a man to excuse lies. The sentence was no more than a joke. Sir HENRY was asked while abroad to write something in one of the albums which German gentlemen were in the habit of carrying. The conversation at the party suggested to him a sort of pun in Latin on his own office, which was thus translated at the time:—"An ambassador is an honest man, sent to lie abroad for the good of his country." The conceit was supposed to be found in the double meaning in our language of the word lie; but as the Latin was more definite it is not surprising that the sentence was taken as embodying English diplomacy, and it was inscribed on several of the windows in Venice. So great an outcry was raised that WOTTON was compelled to circulate an apology throughout the courts of Europe.

MR. HERKOMER, A.R.A., on Tuesday lectured in the Edinburgh Philosophical Institution on "Conventionality and Proportion in Art." It was explained that the greatest qualities in art depended upon three things—(1) on the rightness of things; (2) on spontaneity, which was a quality outside correctness; and (3) on conventionality, which was the structural quality of art. If spontaneity was absent from the mental composition of the painter, all the tuition in the world could give him nothing in its place. Mr. HERKOMER also spoke of the difference between etching and engraving from this point of view. Etching by its birth, it was said, embodied spontaneity; but engraving had a different mission, and brought with it no conventionality. Painters etched, but all etchers did not paint. Some painters had etched, but few had engraved their own works. Photography could not give a soul to a picture, as it was too mechanical.

ON Wednesday next Dr. GARDNER will commence a course of lectures in the Archæological Museum, Cambridge, on the daily life of the Greeks. The following are the subjects:—January 28, Education; February 4, Physical Training; February 11, Medicine; February 18, Commerce and Trade Routes; February 25, Theatres; March 4, Dress; March 11, Houses. The object of these lectures will be to show how the information afforded by classical writers may be supplemented by the testimony of inscriptions and works of art.

IN the United States there is the disadvantage of an absence of archæological subjects; even a haunted house is not to be discovered without difficulty. As it is a natural instinct to be fascinated by the past, it is not surprising that so many Americans, from want of opportunity in their own country, have become explorers in Europe and Asia. It is now proposed to publish an archæological review, which will be the organ of the Archæological Institute of America. The consulting editor will be Professor C. E. NORTON, some of whose researches in Italy have been noticed in this journal. The objects of the review, which is to be issued quarterly, are as follows:—(1) to afford to American scholars the means of taking active part in the progress of archæological science by the publication of papers embodying the results of original research; (2) to provide a careful and ample record of archæological discoveries and investigations in all parts of the world, and to furnish reports of the proceedings of archæological societies, summaries of important papers, reviews of books, &c.; (3) to bring to notice and to illustrate important works in the domain of archæology contained in the public museums and private collections of America, which are little known. English archæologists will wish the new publication every success.

ADMIRERS of Montaigne will regret to hear that his château near Bergerac has been destroyed by fire. It belonged to M. THIRION-MONTAUBAN, a French deputy. It contained a large number of books, pictures, and objects of art, which have been also lost.

A CASE has arisen in Dublin which illustrates the grievances of the leasehold system. Some years ago a man bought the interest in the lease of a piece of ground which was held under Trinity College, and adjoins the College park. It was for forty years, but there appears to have been a tacit understanding that it was renewable for ever, and with this assurance a large sum was expended in erecting houses. The College Board did extend the lease for a further term of fifty years. The property is now worth about 750*l.* a year, which in Dublin is a rather large sum, and as the second term has expired the Board are about to take the houses as well as land into their own possession. If a farmer erected a house on a field belonging to the College tenant-right would be recognised and compensation would have to be given, but if buildings are erected on plots of the College ground in Dublin they are entirely at the tenant's risk. The reason of the anomaly is that in one case the ground is taken by square measure, and in the other by lineal or frontage measurements.

It is clear, from the discussion on fireproof doors at the Institute of Architects, on Monday, that the Metropolitan Building Act does not meet all the requirements of the present time. By restricting the means of protection to iron alone a bar is placed to invention. The district surveyors have to carry out a literal interpretation of the Act, although they might suggest much better arrangements from their own experience. Iron expands, and if a door made of that material is attempted to be closed after a fire has commenced, it will no longer fit closely and become a barrier to the flames. The fire-offices are also varying in their requirements, and, between them, surveyors, and the uncertainty of magisterial decisions, a London architect's commission has been no sinecure. The district surveyors should meet and candidly formulate their opinions on the shortcomings of the Act.

M. GAGET, director of the firm of MM. GAGET, GAUTHIER & Co., has been made a Chevalier of the Legion of Honour. The name of the firm is connected with some of the most important public works in France. But what has probably inspired the honour is the part taken by M. GAGET in the construction of the colossal statue of *Liberty*, which is now being taken down to be transported to New York. The work is a tribute to French ingenuity and organisation. When it is remembered that the figure is the biggest statue in the world, that it is composed of separate plates, and, finally, that it was put together in a confined space in Paris, M. GAGET's skill is apparent. The plates, we may mention here, are to be transported by barges along the Seine to Rouen, whence they will be shipped to New York. About a dozen of M. GAGET's men will be sent over to erect the statue, by rivetting the plates to the interior girders.

THE Lanthorne Tower, which forms part of the Tower of London, has been rebuilt under the direction of Mr. TAYLOR, of the Office of Works. The building, which is circular in form, and about 60 feet in height, is built of Kentish rag with stone facings and dressings, an octagonal castellated turret at the north-east side of the structure being carried several feet above the main body of the building. The walls are 5 feet in thickness, the tower containing five floors. In continuation of the tower eastward, and extending to the Salt Tower, a distance of 150 feet, a massive ballium wall has likewise been erected. It is built of similar materials to the Lanthorne Tower, and is 10 feet in thickness. It is 21 feet in height, and surmounted on the south side by castellated battlements. In the centre there is a recessed Gothic archway leading into the open area on the north side. Immediately on the north side of the wall a flight of steps is carried up to the level of the castellated battlements, leading on to a parade extending to the Salt Tower. The parade rests on a series of Gothic arches.

## THE ROMAN LAW OF BUILDINGS.

THE reports upon the tenure of building ground on the Continent suggest that the influence of the old Roman law is still felt, more or less, from Spain to Russia. In fact the customs which prevail far away in the north of Europe, with regard to house property, show that influence in a marked degree. Thus, for example, we find that in Finland, whenever a renewal of a lease is refused by the landlord, the houses do not necessarily become his property, and that the tenant who built them may be compelled either to remove them or to sell them to the landlord at a valuation. In the Baltic provinces, where timber is largely used in construction, there is a custom by which the lessee is at liberty to remove his buildings if he cannot agree with the landlord about the amount of compensation. Now it is remarkable that in the second book of the "Institutes," which give a digest of Roman practice, there is a somewhat similar recognition of the respective rights of landowners and of tenants who are house owners. It will be necessary, however, to say a few words first about the ancient law of property.

The Roman law affirmed that air, running water, and the sea were common to all, and consequently the seashore and the banks of rivers were not recognised as the property of individuals. A case like that which has been brought against the Clyde trustees, by Lord BLANTYRE, for interference with slob and mudland would hardly be heard in a Roman Court. Any freeman might erect a hut on a shore to dry his nets, and a right of way was recognised provided that no injury arose to farms, monuments, or edifices. The ground appropriated to public exercises, or races, theatres, temples, the walls and gates of towns, were also outside the limits of private property. If a temple were destroyed, the ground on which it stood was still considered as sacred. It is possible to trace a recognition of the principle of common property in the division of public lands under the agrarian laws, and in certain cases wherein the right of possession was possessed by the *gens*. But the consideration of that part of the subject would take us too far. What we desire to suggest is that there was a principle in the laws and traditions of Rome which circumscribed the power of individuals in acquiring property, and that although a man might covet certain things which he saw, and for which he was willing to pay, he might as well seek to possess the moon.

The extent of the limiting power was a topic which gave rise to much discussion among the nobles of the robe. For many years there was a controversy as to the proportionate proprietorship in such cases as when one man supplied timber and another made it into a chest, or when one man gave gold or other metal which was converted into a cup by an artist's skill, or when a block of marble was supplied and was fashioned into a statue by the hands of the slave of a fellow-citizen. All such subjects might appear mere trifles hardly worth consideration unless in a debating school, but the law of property was exhibited in them. There were two parties (Sabinians and Proculians) among lawyers, who held different opinions in regard to the respective rights. A third party endeavoured to take a middle course by maintaining that in such cases as those we have mentioned, if the species were reducible to the former rude materials, the owner of the materials was to be recognised as the owner of the new species. Thus the man who brought the gold would become the owner of the cup, and not the metal-worker, but it would be less certain in a case relating to the liquid which the cup might contain, supposing that the materials were not supplied by the man who compounded them. If a man used another's purple material to form a part of his vesture, the cloth then belonged to it by accession, but the owner could have an action against the purloiner, and it was indifferent whether the wearer had not himself made the robe. The principle of accession, it is needless to say, is recognised in English law, and is of two kinds, natural and artificial. One is seen in the acquirement by a proprietor of land which may be created by the action of a river; the latter (which has more interest to our readers) is seen in the property that is acquired by the owner of the soil in buildings which he has not erected.

By the Roman law every building was considered to

resemble the purple cloth, and to be an *accession* to the ground on which it was built, and therefore was the property of the owner of the soil. It might happen that the house was erected with materials which were not paid for on or before delivery. The contractor or merchant could not enter on the ground, pull down the walls, and remove the materials. The Roman legislators who framed the Twelve Tables were at pains to impede the demolition of houses, but the man who supplied the materials was not without his remedy. By an action entitled *de tigno juncto* he could compel his debtor to pay double their value, and all materials used on the building of a house came under that designation, which is suggestive of primitive timber huts. If by any chance the building was entirely or partly pulled down, in that case (unless he had already obtained the double value) the contractor could claim his materials, besides bringing an action for their use.

If a man built a house with his own materials on ground which was not his own, the house was still an accession, and as such became the property of the owner of the soil. If it fell or was pulled down he had no claim on the materials, of which he was supposed to have made a voluntary alienation. But if, after the completion of the house, the landowner claimed it, and refused to pay all the cost of building it, he was liable to an action for fraud. There was, however, a risk attached to the tenancies of building sites, for it was one of the surest marks of unwisdom in a Roman to have it said of him that he built on ground belonging to somebody else. It is not surprising that the prejudices against building leases have been transmitted through many generations, and are as strong as ever in those countries which formed parts of the Roman Empire.

It is the aim of legislators, like philosophers, to seek after unity in their productions, and, accordingly, it is found that the law which regulated the respective rights of soil-owners and house-owners was extended to very different things. We see an application in settling the ownership of manuscripts, which probably would be analogous to modern copyright law. "As whatever is built upon or sown in the ground belongs to that ground by accession, so letters also," says the compiler of the Institutes, "although written with gold, appertain to the paper or parchment on which they are written. Therefore if TITUS writes a poem, history, or oration on a scroll belonging to SEIUS" (these two names were as famous in Roman law as JOHN DOE and RICHARD ROE in England) "he shall not be deemed the master of his own work, which is to be reputed as the property of SEIUS. But should SEIUS demand his parchments from TITUS, without paying all charges of writing, then TITUS can defend himself on the plea *exceptionem doli mali*." The application of the law to painting was more liberal to the artists. Some of the Roman jurists, who were sticklers for consistency, considered that pictures and houses should be regarded as examples of accession, and that the owner of the tablet, whatever might be the material, could claim the painting. Others, again, said that it was absurd to suppose that the work of an APOLLES or a PARRHASIUS should go as a matter of course with a piece of wood that might be almost worthless. In this case compromise again came into play, and it was made possible for either painter or property man to purchase one another's rights. Strange as it may appear on this point, the Roman law has not become obsolete. Not long since the courts applied it in a case where expensive drawings had been made on lithographic stones, and the owner of the stones claimed as much right to the drawings as if he had paid for them. Those who formulated the principle of accession could not have anticipated so distant an application of it.

The English maxim, that every man's house is his castle, reveals the national spirit of isolation by which each Englishman becomes, as it were, a miniature island. The Romans endeavoured to counteract natural selfishness by insisting on the observance of mutual rights. Roads and aqueducts were carried along the most convenient routes regardless of individual rights. It was also laid down that neighbours should bear their neighbours' burdens (*ut vicinus onera vicini sustineat*), not figuratively, but in reality by allowing the beams of one house to rest when necessary on the walls of an adjoining house. Gutters and drains were often used in common. It was also nearly as risky for a man to raise his house and darken his neigh-

bour's lights as it would be in modern times in England. It was even said that a man could dig for sand on a neighbour's ground as a common right. What is more remarkable, it seems to have been a custom for a Roman, when dying, to take away from his heir all power that might be used to interfere with the amenity of a neighbour's house.

The necessity of good feeling between the inhabitants becomes evident when the character of the towns in the Roman state is considered. Drawings like those by the late Professor COCKERELL and Mr. ASHPITEL suggest that Rome was made up of nothing but streets of palaces. But in that city there were very narrow streets, bad paving, and imperfect drainage. In the provincial towns the arrangements are likely to have been in a worse condition. A cantankerous fellow could, by putting an extra storey on his house, or by cutting off the connection between his own and his neighbour's gutters, put many people to inconvenience.

English law in regard to use is much less elaborate than that of the Romans in dealing with their great variety of usufructs, although we can attain a similar luxury by special covenants. The English maxim which says that "he who hath the use of land is deemed to have the land itself," would scare a Roman lawyer by its extreme liberality. Tenants who took houses and fields for short terms were probably looked on with more or less suspicion, and had to be bound by restrictions, for at one time it was considered that a man who took a house was excluded from having a guest or a lodger. Afterwards it was laid down that an occupier had a right to inhabit a house with his wife, children, and freedmen. Slaves were of course to be accommodated elsewhere. There was a recognition of a different class of tenants, those who paid a proportionably small annual rent, but who were supposed to hold the house or land in perpetuity on condition of certain improvements being carried out. At first the heirs of the lessor had no right to interfere with the arrangements, even when the tenant had disposed of his rights. But doubts having arisen about the legality of such a contract, laws were enacted by which it was left to the parties to make their own arrangements. It is evident that within certain limits much latitude was allowed, and that in Rome, as in all wisely-conducted states, the truth was recognised that "society, a living, growing organism, placed with apparatuses of dead, rigid, mechanical formulas, cannot fail to be hampered and pinched."

### SCOTTISH ABBEYS.\*

THE speakers at one of the late meetings of the Edinburgh architects complained of the inaccuracy with which their countryman, Mr. FERGUSON, described Scottish buildings, and we have often heard similar objections raised against the writings of other north-countrymen, who, while living in London, have had the temerity to treat of work beyond the Tweed. What fate would await a Southron who attempted the task cannot well be imagined, and indeed there has been plenty of dissatisfaction because of the commercial enterprise of English publishers in undertaking the production of books on Scottish archæology. The objectors do not ask themselves or one another why they have not done more to make the northern buildings known to the world. When the opportunities are considered, the neglect seems to be almost culpable. There has been of late years more eagerness to produce records of the secular and ecclesiastical buildings, and the sketch-books of the Edinburgh Association contain many plates of the subjects. They are not all, however, equally well executed. If the conditions of the bequest did allow, the Rhind lectures might with advantage be devoted to the subject. The volume of which Mr. AITKEN is the author should meet with approval, since there is very little English work in it. Mr. AITKEN is a Dundee architect, and the book has been printed as well as written in that town. The only shortcoming it can have is that the plates have been reproduced in London from the author's drawings. The buildings described are the abbeys of Arbroath, Balmerino, and

Lindores, which are all typical examples of the English Gothic that is found in Scotland.

Architecture was one of the instruments employed by the great St. MARGARET in her endeavours to civilise the subjects of her husband, MALCOLM CANMORE. Her three sons during their reigns imitated the queen's example, and endeavoured to assimilate the Scottish and English churches. The northern bishops adopted the constitutions of southern dioceses, and a similar spirit of imitation was found in various ecclesiastical establishments. St. MARGARET died in 1093, when Romanesque held sway, and it had not been entirely superseded in 1178, when WILLIAM THE LION, her great grandson, founded the Abbey of Arbroath, or Aberbrothock, which was one of the grandest of Scottish conventual churches. Seven years before, that is in 1171, the Archbishop of CANTERBURY was murdered, and it shows the reverence in which his memory was held when we find that the King of Scots dedicated the church to St. THOMAS À BECKET. The building was sufficiently advanced to allow of the burial of the king within it in 1214, and it was completed in 1233. Fifty-five years is a long time for a church of the kind to be in hand, but the building was large, being 271 feet in length; and three years after the foundation WILLIAM was taken prisoner by the English, and could only regain his liberty by consenting to do homage for his kingdom, while afterwards he had to pay the enormous sum of ten thousand marks to RICHARD I. It is not surprising that under the circumstances there was a delay in the building works. The position of the building was well chosen, for the ruins now appear impressive when seen from a steamer; but, as Mr. AITKEN says, "its exposed sea-coast situation rendered it open to maritime attacks by the English; and, though one of the wealthiest abbeys north of the Tweed, its means must have been once and again seriously crippled, and the ambition of its art-loving abbots fettered, by heavy outlays for structural repairs." Forty years after the dedication the abbey suffered greatly by fire; in 1380 the roofs of choir, nave, and transept were destroyed by a second fire; and there was a third in 1445. The building was altered from time to time. How did the abbey fall into its present state of ruin? That is a question which is easier to ask than to answer. The early Reformers in Scotland were far less destructive than their English brethren, and it was not until the middle of the seventeenth century, when the Covenanters took power into their hands, that there was an approach to iconoclastic excitement. At Arbroath it was neglect rather than vandalism which caused the existing desolation. "The removal of the protecting roofs," says Mr. AITKEN, "necessarily led to decay of the interior under the disintegrating influences of the sea air. The fall of the heavier parts of the superstructure then became only a question of time; and so we learn that in the eighteenth century the western towers, and hereafter the central tower, fell with destructive force on nave and transept walls, a calamity hastened no doubt by imperfect foundations, which, if we may infer from the instances at Chichester, Ripon, and Peterborough, were the weak point of Mediæval architecture." It would be satisfactory to be assured that there is a possibility of the ruins remaining without further destruction. The walls are in peril from the isolated condition of the piers, which are still as much as ever exposed to atmospheric influences. The work is excellent, and it would be a national loss if what remains were to succumb, and the outline of the great window to be no longer seen against the sky.

Balmerino Abbey was long used as a quarry for neighbouring houses, and we are told that "of the original monastery, the chapter-house is the only part that remains in any degree of completeness. Of the church itself, very little is left above ground to satisfy the quest for imaginary restoration." The granary remains, and is still used for a storehouse. Mr. AITKEN has endeavoured to restore a plan, which appears to be consistent, but he has refrained from attempting to suggest the upper parts. The abbey was an offshoot of the Cistercian house which was founded at Melrose in 1136, and was destroyed in the Wars of the Succession, but to rise again at the desire of BRUCE.

Lindores was founded in the same year as Arbroath by the king's brother, and between the end of the twelfth and the end of the thirteenth century the principal churches were erected. There was historic interest about Lindores

\* "The Abbeys of Arbroath, Balmerino, and Lindores." Illustrated and described by George Shaw Aitken, F.S.A. Scot., Architect. Dundee: John Leng & Co.

for in it Sir WILLIAM WALLACE retired for repose after the battle of Earnside, and within its walls a compact was entered into by some of the Scottish knights to aid the enthronement of ROBERT the BRUCE. There is, unhappily, but little to suggest the beauty of the building. The plan of the church is peculiar, having only one aisle, in which the eastern bays are wider than the western. The three buildings are, like most of the Scottish work, rather severe in style, and it has not yet been satisfactorily explained why there should be so much difference between northern and southern work of the same period.

We are glad to see that Mr. AITKEN has obtained several subscribers for his interesting book, and it deserves to meet with liberal patronage. A book of the kind, containing so many plates, is necessarily expensive, and unless there is encouragement from Scotsmen it cannot be expected that Mr. AITKEN or any architect can repeat the experiment.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixth ordinary meeting of the Institute was held on Monday evening, Mr. Ewan Christian, president, in the chair.

### The Late Mr. Whichcord.

The PRESIDENT, in announcing officially the death of Mr. Whichcord, laid stress on that gentleman's devotion to the interests of the profession and of the Institute, whose services, whether in the chair or at the council-board, had been as valued as they were indefatigable, and who besides was ever ready to give assistance in a question of difficulty.

Professor KERR, in the course of some remarks, said he had seen statements in the two professional papers he was in the habit of reading, and he should not think it right to allow the opportunity to pass of contradicting the impression that Mr. Whichcord as president had been in any way unpopular. Mr. Whichcord was the first of a new dynasty, and certain differences of opinion and matters of controversy there had been, but in no way had these touched the loyalty of the Institute to him as president.

Mr. HANSARD referred to the time, about the year 1857, when Mr. Whichcord with Professor Kerr, the Brothers Papworth, himself, and others, had been in the habit of meeting at the house of Mr. Ashpitel. There the idea of a diploma for the Institute was first propounded; and although they were too few to carry their point, it had resulted in the establishment of the Institute examination.

Mr. MACVICAR ANDERSON expressed his regret at the loss not only of a valued colleague, but of a trusty friend.

Mr. WM. WHITE, F.S.A., then read a paper, entitled,

### Fireproof Closing of Openings, in Relation to the Metropolitan Buildings Act.

Mr. White, after some brief preliminary observations, proceeded to discuss the main subject, consisting of three essential parts: the material of the door, its fittings, and the arrangement of the opening.

In the first place, for the material of the door, iron still held its own. It was not altogether free from perils of its own, but on the whole it was the safest. Mr. Brannon's concrete doors on iron wire lattice frames were admirably suited for fireproof purposes. Wood itself was one of the best non-conductors, and when thoroughly encased in plaster or sheet iron its resistance was remarkable. An oak door double planked with metal or asbestos would be very safe. A solid oak door of 3-inch or 4-inch plank, even without extraneous protection, was said to resist almost any fire, provided its edges were well protected. He did not know whether the merits of cyanite or asbestos paint on deal doors had been duly tested. But the door prescribed by the Act was of wrought iron, the thinnest panel of which was not to be less than  $\frac{1}{4}$ -inch thick; hence it was commonly a sheet of iron rivetted on to a skeleton framing of the same thickness, dividing it into two or more panels. The possible perils incident to this construction were pointed out, but it was owned that in many serious cases the thickness of iron provided by the Act had sufficed; still, it might often be well if the metallic shield were thickened out. Something might also be done by a contrivance for automatic closing of doors on the outbreak of a fire. Whether iron were the best material or not, it was at present the only one required or allowed by the Act.

Secondly, the Act required the iron doors to be fitted into a rebated frame. There must not merely be a rebated frame for the door to be hung in, but it must be so fitted that no space must be left anywhere round the edges; thus no draught must be able to pass, and no heat, save by conduction and radiation. The first effect of the great heat upon the iron would be to so expand it as to fix it in its framework and make it still more

impermeable. Mr. White said he had been told by Mr. Aston Webb that on two occasions of a fierce fire in the smutting-room of a mill at Deptford, which was thoroughly burnt out, the ordinary iron doors fitted in this manner effectually resisted the communication of the fire to the adjoining division of the building, although in each case one of the doors was found to be warped out of its rebate. This doubtless took place in cooling, when the worst of the danger was passed. As a construction exactly answering to one not meeting the requirements of the Act, and one not more satisfying the wants of those who on their own account might naturally be thought to wish to adopt a reasonably fireproof system, were adduced the doors separating the different buildings lately destroyed by the great fire in the Queen's Road, Bayswater.

Coming now to the third point, Mr. White remarked that the facilities afforded for the spread of fire were largely and dangerously increased by the great and improper number of openings in each divisional wall. By means of these openings each storey became practically a huge horizontal warehouse, without any fireproof separation in its height, and accordingly with a succession of seven distinct risks, arising from the seven portions into which the building was nominally separated. On each of the five storeys were two openings in each party-wall dividing the several structures. Thus in each party-wall there were ten openings instead of one, and they were told that nobody was responsible for this state of things except the luckless depositors, who ought to have made a personal inspection of the premises, or possibly obtained a professional opinion on their construction before risking their property there. It was not for him, said Mr. White, to give an opinion as to who was responsible for so scandalous a state of things, but he was greatly astonished to be told there was a serious question as to the number of openings allowed by the Act in any one party-wall. He was told that district surveyors generally take it for granted there was no restriction. He knew that some who had studied the Act carefully were of the same opinion. Against this laxity of interpretation he argued earnestly and at considerable length. After all, however, it seemed to be undeniable that there were really no means of enforcing these provisions of the Act. No penalties were attached to its evasion in these respects. There was no Government Commission, and no system of inspectors to watch over its enforcement, as in the case of the Factory Acts. Again, the Act merely spoke of a building "used"—not "hereafter to be used;" and so the condition could not be enforced till after its occupation. The restriction would not apply till after the granting of the district surveyor's certificate, leaving the owner or occupier free to use it in any way he may see fit. If this should be so indeed it was a case for immediate legislation, or, at any rate, for administrative reform. It would be well if in the case of these huge warehouses matters could be put on a better footing for the protection of the public. In respect to dwelling-houses care was really taken, the district surveyor having power to get a magistrate's order to stop or even to take down improper work. In theatres, personal safety had not yet been really secured by the compulsory provision of due means of exit in the event of panic. He, however, had done his duty in calling attention to necessary reforms.

Mr. WOODTHORPE admitted that exception might be taken to some points in the Building Act, and there were things that were difficult for a public officer to interpret and to carry out. In cases of moderate fires the present form of the Act had succeeded. In cases of monster fires it would be difficult to find anything that would infallibly answer. Nothing could be perfect, not even an Act of Parliament. Many fires had been stopped by closing the iron doors. But a weak point was that there was no power to compel the closing of the doors. It was too late to close them when a fire had made great headway. Closing doors at sundown should be enforced under pain of a heavy penalty. Another thing, and this he hardly liked to speak of, was that fires were sometimes "committed." District surveyors had to do the best they could where opinions were divided.

Mr. JENNINGS said his experience of fires began with his earliest years. It seemed to have been implied that district surveyors did not do their duty, but it was well known they had no powers beyond bringing a case before the magistrate. He believed double doors had succeeded perfectly in localising a fire to one part of the building. To make compulsory the closing of doors would require that police should make regular rounds of inspection, and an Act could not carry that out. His experience during fifty years was that fire never passed through a properly-built 9-inch wall, except owing to the presence of timber. In making alterations people, without knowing, frequently cut through a party-wall up to the plaster on the other side. He did not think the number of openings in party-walls, from one department to another, mattered, provided there were double doors which were kept closed. The number of fires had increased with the adoption of lifts. These well-holes should also be closed at night by iron doors.

Mr. ROBERT WALKER protested against Mr. White talking

of district surveyors infringing an Act of Parliament. Iron doors, far from being a failure, had proved a great success, and this the insurance offices had recognised. A large amount of goods owed their preservation to the iron doors, in the fires at the Haymarket and Bedford Street Stores. It took much more to prevent fire spreading vertically than laterally through a party-wall unless there were openings protected only by plate glass or cross-currents. Sliding-doors, properly fitted, were better than swing-doors. The latter could seldom be closed at short notice, owing to the obstruction of bulky articles placed against them. The worst material for fire-resistance was stone, and stone was allowed to be used by the Act. Fire-brick, such as was used by Mr. Whichcord throughout his building, was the best material. If only one door was allowed in a party-wall, business would be altogether obstructed. There was no objection to the openings if the doors were properly constructed.

Mr. TAVERNOR PERRY showed a photograph of Messrs. Foster & Co.'s premises in Cheapside, the scene of the fire.

Mr. J. H. HEATHMAN, manager to Messrs. Merryweather & Sons, said the spread of fire at Messrs. Whiteley's was not caused by iron doors but by the proximity of woodwork to the doors. No timber should be allowed nearer than 18 inches to a door. He was in favour of swing-doors fitted with sufficient play to prevent them buckling under fire.

A gentleman, who did not give his name, from the Fire Insurance Committee, said they had lost faith in the Act, and that they did the best they could for themselves. He described a door that they required their surveyors to insist on, but on being questioned by the President, he could not point to a case where the efficiency of this door had been tested by a fire.

Mr. HANSARD said the fire offices were wrong in insisting on rabated folding-doors. Sliding-doors, not too large in dimension, properly sunk and raised, and run on iron guides, were best.

Mr. H. H. COLLINS said they had no option but to make the doors as laid down by the Act. The Metropolitan Board had invariably refused to allow him to make any departure from the terms of the Act, and rightly so, as the Board had no power to do otherwise. Instead of drawing up rules for constructing doors, the fire offices should put a stipulation in their policies to the effect that the policy would be void if the doors were not kept shut, or at least they might charge an increased premium. In this way they would materially help district surveyors. Mr. Ebenezer Saunders was a careful architect, who thought Mr. Whiteley's premises were properly built. Mr. Whiteley left depositors to insure their goods if they liked. Depositors, more especially one who was an architect, should have judged whether the building was secure enough to warrant putting property in it.

Professor KERR agreed with Mr. Collins that the remedy lay in the hands of the insurance offices. Surveyors were powerless in the matter. If the fire offices, having the privy of contract with the public, would lay down rules and insist on the rules being conformed to, great good would be done. It had always seemed to him, in connection with the apparent insufficiency in regard of the stipulation as to the area of limitation, that Parliament meant no more than to advise the public what to do, and trusted to the fire offices to make their experience useful. He hoped the gentleman from the Insurance Committee would bring his influence to bear on his colleagues.

Mr. WYATT PAPWORTH said that the essential point was that iron doors should be properly constructed.

Mr. WHITE, in replying, said he had not intended to make any insinuations against district surveyors. The openings in a party-wall should be limited, he thought, because the closing of the doors was not compulsory.

The proceedings terminated with a vote of thanks to Mr. White for his paper.

### ARVERNIAN ARCHITECTURE.

NONE of the local forms of Romanesque which arose in the latter half of the eleventh century has, says Mr. E. A. Freeman, in a communication to the *Guardian*, a more distinct character of its own than that which prevails in Auvergne. The architecture is as marked as the scenery; it would be hard to find the fellow of either anywhere else. And the Arvernian style is in some sort more satisfactory than the Angevin style. The Angevin style looks too much like a mere caprice. Why should people build churches so amazingly wide and low, and without any pillars and arches? It is always dangerous to ask Why? in any matters of this kind. It is hard to say why either an Arvernian or a Norman built in two different ways in those points in which they did build in two different ways, and to an Arvernian eye the Arvernian choice may seem as strictly the natural thing to choose as the Norman choice seems to us. But neither a Norman nor an Arvernian building has anything

like so much the air of a whim as the Angevin building. Most of the points on which Auvergne differs from Normandy may seem fair questions of taste. Each way of building is effective; each has its own specially strong points. We do not stop and look at either simply because it is odd, which really is sometimes the case in Anjou. On one point only we must draw the line. If we ask why—unless as a mere matter of caprice—the Angevin architects left out pillars and arches, we are driven to ask why—unless as a mere matter of caprice—the Arvernian architects built their west fronts and western towers of so strange a shape or lack of shape.

But in any case none of the varieties of Romanesque art is better worth study than the noble style of which the once collegiate church of Notre Dame du Port within the walls of Clermont is, on the whole, the typical example. At Issoire we find it on a greater scale, but a little later in date. Brioude has some special features of its own. At Riom we have not the pure Arvernian style, but a piece of instructive transition from that style to another. Saint Nectaire, in other points almost as typical as Notre Dame du Port, in most points wonderfully like it, differs altogether in one of the chief features of external outline. But in all we feel, as we feel in all these local varieties of Romanesque, that the word "style" is out of place. The difference is, after all, that of a manner of building, not that of a style of architecture, strictly so called. At Clermont and Issoire, as everywhere else, it soon strikes us how much more these various types differ from one another in their general arrangements and conceptions than they do in mere detail. Here, too, we see capitals, bases, whole windows, which might belong to one country as well as another. In these matters the various styles which grew up in the eleventh century hardly differ so much from one another as the later Gothic styles do. Here is a typical Arvernian church; most of its details—certainly not its south doorway—might be found in a typical Norman church; most of them might be found in a typical Lombard church. Yet our Arvernian church, as a whole, is altogether unlike anything either Norman or Lombard. Still less is it like anything Angevin. Auvergne certainly did not sympathise with the dislike to pillars which became characteristic of Anjou. The style naturally has affinities with that of Aquitaine, the land of which in its widest sense Auvergne formed part. We come in, for instance, for the barrel vault as a specially characteristic feature. But Auvergne loves columns and half-columns, and is not satisfied with the Aquitanian square piers. An Arvernian church shows itself at a glimpse as belonging to Southern Gaul and not to Northern. Yet the style has quite enough distinguishing features of its own to claim to be looked on as a distinct variety of Romanesque, and for Auvergne, as distinguished from Aquitaine, to be set down as a separate architectural province.

A typical Arvernian church has a character of its own which it is impossible to mistake. As a rule, a square tower at the west end and an octagonal tower in the middle suggest to an English eye a faint analogy to Ely or Wymondham. Very faint indeed the analogy is to either; still the square and the octagon are there, however much their proportions may differ from the proportions of the square and the octagon in the only two English churches with which we can compare them. The Arvernian central octagon has a strange look in the way in which it rises, not immediately from the four limbs of the church, but from a kind of oblong base which it is not easy to describe, but which is one of the most marked characteristics of the style, within and without. The truth is that the innermost bay, so to speak, of each transept, those which in the ground-plan range with the aisles of the eastern and western limb, are carried up to the full height of the lantern. Outside, this gives the tower this broad base to spring from; if the tower was away, it would have a good deal of the effect of the high choirs of the Cistercian churches in Sicily. Inside it increases the effect of height, and it further supplies a new pair of lofty arches to increase the complication of grouping, and of arches crossing one another, some measure of which is necessarily found in every cross church. The effect of this very singular arrangement is, to our taste, certainly much better inside than it is without.

If the central octagon has a base of its own to rise from, the square tower at the west end has something of the same kind. It commonly rises from between a pair of huge shoulders, forming outside what we might almost call a western transept, but which has a very different character from the western transept of Ely. Its lower stages have a tendency to take the shape of something like a narthex, which, opening into the nave by one or more arches, is sure to make a striking feature. And it is curious that this narthex not uncommonly has the air of being the oldest part of the church; at least, it often contains capitals which may well be older than any of their fellows. This narthex again, as forming part of the tower, has other stages above it, opening into the church, sometimes by wide arches like the German triforium galleries, sometimes by coupled windows. Indeed, most of the Arvernian peculiarities have, like this of the western tower and transept, a tendency to

affect inside and outside at once. At the first glimpse of one of the churches from without, we might be tempted to fancy that, Angevin fashion, it had no aisles. The nave has lofty side walls, with arcades and windows of two stages. In the lower range the windows are placed under bold wide blank arches. Above these an arcade of small arches and shafts has some of its members pierced as windows. We have in fact the windows of an aisle and the windows of a clerestory; only they are placed in the same wall, one above the other. To this arrangement, which looks strange outside, we find the key within. The rule of an Arvernian inside elevation is to throw the triforium and clerestory into one. The piers, of whatever shape, are lofty: above them runs an open arcade, just below the springing of the barrel vault, which seems universal. Inside, one hardly knows whether to call it a triforium without a clerestory, or a clerestory without a triforium. It really is a gallery of the width of the aisles below, with its windows placed in the outer wall, above those of the aisles. Such an upper range of windows over the aisle windows is common in the triforium of large churches. Only then there is the clerestory rising again behind and above all. Here there is no other clerestory; the wall with its two rows of arcades and windows is the full height of the church.

The east ends follow a type which is more common both in Northern and Southern Gaul than it is in England, though it once existed in a good many English churches from which it has now vanished. This is the type which we have already seen in so many of the churches of Poitiers, the apse with its surrounding aisle and diverging apsidal chapels. But there is one peculiarity which Auvergne seems to have to itself. The series of apsidal chapels is sometimes, not always, broken by a single square chapel in the middle, at the extreme east, making the actual east end of the church flat. Indeed this complicated and artificial arrangement of chapels becomes in these churches so completely a matter of course that we almost begin to long for the simple grandeur of the great single apse, as at Cerisy and Lucca, and at Peterborough before the addition of the retrochoir. Inside we are less likely to weary of the majestic arrangement of the columns of the apse, ranged close together with their narrow stilted arches and the clerestory above, forming a noble range of eastward *cancelli* for the high altar. We have seen this at Poitiers; we see it again at Clermont, at Saint Nectaire, and at Issoire. And wherever we see it, we welcome it.

In the details we mark some singularities in the use of ornament. Speaking roughly of the insides, we might say that everything is plain except the capitals. The Arvernian architects seem to have had little notion of the application of ornament to surfaces, and not much notion of the setting of order behind order. These are such fertile sources of enrichment in our own Norman buildings that the absence seems strange to us. The actual openings of the windows, for instance, are perfectly square and plain; but there commonly is a billeted label outside and shafts within, and the capitals of the shafts, like all columns, great and small, may be made as rich as any one chooses. The doorways are not very remarkable, and never have anything like the richness of our Norman doorways. Sometimes the actual opening is square, and that without any strongly developed tympanum. In the outside of the apses and transepts there is often a good deal of sculpture and inlaid work; here sometimes, and in the insides of the transepts also, we find that straight-sided patten—we can hardly call it an arch—which carries us to Lorsch and Earls Barton and the Pictavian baptistry. Otherwise there is little in these churches to suggest the earlier types of Romanesque—nothing, perhaps, except the strange capitals which have been mentioned as being sometimes found at the west ends, and now and then a midwall shaft, or an approach to it, in the many groupings of small shafts and arches with which the Arvernian interiors abound. These last are a marked feature of the style. Its arrangements bring in a good many blank spaces, and each blank space is seized on to make an unglazed window within the church. Such windows are specially common over the lantern arches. The arches are commonly round; but they sometimes take the shape of a kind of horse-shoe trefoil, which suggests a touch of the Saracen. He has not, however, as in some other parts of Aquitaine, suggested the use of the pointed shape for the main arches. When a pointed arch does appear in Auvergne, it may be set down as a sure sign of Transition, just as in Normandy and England.

The contrast between extreme plainness in some points and extreme richness in others is strongly marked in these buildings, especially in the insides. It is curious to see a church, with every arch left perfectly plain and square, with no enrichment of any other kind whatever, but with every column, half-column, window-shaft, crowned with capitals of the richest kind, not uncommonly alive with highly classical foliage. In weighing the disputes as to the dates of these churches, the idea often suggests itself whether the churches were not built in the latter half of the eleventh century—nothing, save an occasional fragment, suggests an earlier date than that—and whether these magnificent

capitals were often cut out in the latter half of the twelfth. At the same time we must remember that we are here distinctly in Southern Europe, in a Roman land, not in a land which is Teutonic even in that modified sense in which France and Normandy may be called Teutonic. Just as in Italy, we may fairly expect that such arts as were practised at all would be more advanced than they were in Northern Gaul, still more so than they were in England. The foundation of Notre Dame du Port is carried back to the year 580; we hear of a great repair or rebuilding in 866, after a destruction by the Northmen; we hear of building going on between 1185 and 1240. This is a little puzzling, as the first pair of dates are too early, and the second pair too late. There is nothing that one is tempted to carry back to 866, except perhaps parts of the crypt, and possibly two rude capitals in the narthex, according to the tendency which has been already mentioned. And though one could fancy the capitals throughout the church being carved in 1185, there is nothing that one could fancy belonging to as late a date as 1240. One is driven, though we may have no documentary evidence, to suppose a rebuilding in the eleventh century, with, if any one chooses, a certain embellishment in the twelfth, and to infer that the works of 1240 were mere repairs spoken of in the exaggerated way which is not uncommon.

## TESSERÆ.

### Scottish Architecture.

JOHN HILL BURTON.

ARCHITECTURE is proverbial for leaving the artist forgotten, while his work remains to create wonder and admiration. The world is filled with buildings of which the architects are unknown, but which yet are found by the careful student to contain enough to show the character of their acquirements, and sometimes the school in which they must have studied. It is now very well known that, after the rupture with England, Scotland took her ecclesiastical and baronial architecture from the Continent, and chiefly from France. The process by which the rich turreted châteaux of France were transferred to the moorlands of the north and the braes of the Grampians could not fail to be extremely interesting, if we could remove from it the veil which shrouds it in the mystery common to so large a portion of the architectural history of civilised times. How much of it was brought over by foreigners? how much learned in France by Scotsmen who returned to practise at home? are questions that must be asked in vain. We have no clue to the studies which induced Aytoun, by decorating the bulky framework of a German palace with a beautiful coronet of turrets and decorated chimneys, to conceive the plan of Heriot's Hospital. Even so late as the time of Sir William Bruce who worked in the last century, we are not aware how far the conversion of Holyrood into a French château of the sixteenth century was founded on a practical acquaintance acquired on the spot with that style of building. In far later times we know that Robert Adam studied the architectural remains of the Roman empire with a devoted zeal, attested by his great work on the ruins of Diocletian's mighty palace at Spalatro.

### Colour Grinding.

SIR C. L. EASTLAKE.

Among the mechanical causes of the clearness of colours superposed on a light preparation, may be mentioned that of careful grinding. All writers on art who have descended to practical details have insisted on this. From the appearance of some Venetian pictures, it may be conjectured that the colours of the solid under-painting were sometimes less perfectly ground than the scumbling colours (the light having to pass through the one and to be reflected from the other). The Flemish painters appear to have used carefully ground pigments universally. This is very evident in Flemish copies from Raphael, which, though equally impasted with the originals, are to be detected, among other indications, by the finely-ground colours employed.

### The Travellers' Club House, Pall Mall.

W. H. LEEDS.

The general idea, or *motif*, as the French express it, of the Pall Mall front, appears to be derived from that of the Palazzo Pandolfini at Florence, the design of which is attributed to Raphael. Instead, however, of at all derogating from the originality of the English building, the resemblance that may be traced between the two serves only to show how much the beauties of a model may be improved upon by a free imitation of it in the hands of a master. There is a *sveltezza* in the English palazzo which the Italian one does not possess, and more variety in its individual features; it has also more unity of character. It is free from that heaviness in its general pro-

portions, and from dryness of style in the details, which mark its archetype; and it further derives no small degree of additional elegance from the terrace-like screen to the area, which converts into a positive beauty—a graceful, as well as a picturesque accompaniment—what is almost invariably allowed to be more or less a blemish. While it accords so perfectly with the other in its taste, that it would be impossible not to recognise it immediately as the production of the same mind, even were it not known that the two elevations belong to the same building, the garden façade bears the impress of greater originality. The piquant effect produced by grouping together the three centre windows of each floor is as happy as it is unusual: this composition has an indefinable charm, an attractive *non so che* of sentiment, infinitely more captivating than that mere pomp of architecture which is frequently to be met with in designs that, nevertheless, betray complete inanity of ideas. Those who may be so disposed are at liberty to say that there is not so much in it, after all—merely a few windows and rustics, and some other members of detail; in short, nothing more than what anyone else might have done. Very true; but, then, how are we to dispose of the untoward question, Why have they not done so? Why should they—those, at least, who have practised the Italian style—have forborne to avail themselves of it to the extent we now perceive it was possible for them to have done, had they been capable of bringing to it that geniality of feeling and taste without which a work of architecture can never be a work of art, except of art at second-hand, whatever it may be as a production of manual labour and mechanical skill?

#### Preservation of Mural Paintings.

PROFESSOR CHURCH.

The first step in the preservation of mural paintings in disrepair is the complete removal of the whitewash, with which, in most cases, they have been coated. For this purpose I prefer ivory, bone, or horn spatulas, thin at the end, but not pointed. These generally prove sufficiently powerful, but occasionally steel implements are necessary. Whatever the material, the working end of the instrument should be ground in such a way as to present a very slightly curved edge, not the usual semicircular form. It may sometimes be necessary to assist the action of the spatula by means of slips of linen, wetted with hot strong glue, ironed on to the whitewash, and allowed to dry there before being torn off. Bellows and badger-hair softeners are useful to clear away dust and reveal the work. They must always be used (or, if needed, stencil brushes) before applying the reviving, fixing, and waterproofing liquid, which is made by the following recipe:—Melt 2 ozs. by weight of pure white bee's-wax, and pour the melted wax into 6 ozs. by measure of oil of spike lavender, or oil of orange peel. Warm the mixture until it is clear, and then add 10 ozs. by measure of picture copal varnish, and 26 ozs. of freshly-distilled spirits of turpentine. The above mixture is to be applied warm by means of a broad flat, soft brush to the wall picture. Sometimes it is necessary, if the colour be at all easily detached, to apply the fixing liquid to the wall by means of a spray producer. A scent-distributor, worked by an indiarubber ball, by bellows, or by Fletcher's foot-blower will answer.

#### Wood Dowels in Greek Masonry.

EDWARD DODWELL, F.S.A.

The frusta of the columns in the Propylæa were united with wood, which some have imagined to be olive, but those which I procured were of cedar. They were discovered when the blocks of the Propylæa columns were thrown down. The centre of the horizontal surface of each corresponding frustum contains a hole or mortice, 4 inches square and  $3\frac{1}{4}$  in depth; each hole is filled with a piece of squared wood, fitted exactly into the two contiguous mortices. The centre of this square piece is perforated for the purpose of receiving another piece of a cylindrical form, acting as a *gomphosis*. This was probably not designed to give any additional strength to the union of the blocks, but to serve as a centering, on which to turn the upper block, in order to insure a coincidence of the flutings; for it seems likely that the flutings were begun, or roughly sketched, before the masses of the columns were placed upon each other, and that they were finished afterwards. The columns of the temple of Apollo Didymæos, in Asia Minor, have been left in a very unfinished state, and the flutings are more or less imperfect. The columns of Eleusis, Thorikos, and Delos, and of other places, which are only fluted at the base and under the capital, probably owe their origin to that cause; but it is not likely that the flutings at the three last-mentioned places were ever intended to be finished. The cylindrical or inner piece of wood above-mentioned was worked extremely true, and evidently turned by means of a lathe. It has been, as it were, hermetically closed between the blocks and inaccessible to the contact of the air, and accordingly preserved without the smallest injury; the two outer bits were painted red; some of the colour was visible when first found, and the remains of it may still be seen. The columns of the

Parthenon and of other Grecian temples are, no doubt, united in the same manner, for the blocks that have fallen down have the square hole in the surface for the reception of the wood, similar to those of the Propylæa. Wood was made use of to unite stones in the earliest times. The eleventh verse of the second chapter of Habakkuk is applicable to the proverbial strength of such a union:—"For the stone shall cry out of the wall, and the timber that is between the joints of the building shall answer it." Flaminio Vacca, in his "Memoirs," says that the stones of the forum of Nerva, at Rome, were united with wood. But these instances probably relate to the dovetail or *imantosis*, and not to the pieces of wood in the columns above-mentioned, which do not act on the principle of the dovetail. Le Roy says that the columns of the Doric edifice at Thorikos were united by a hard, red wood, in the same manner as those of the Propylæa; and the late M. Dufoury, of the French Institute, who was at Agrigentum when a column of the temple of Juno fell, found the wood which united the blocks, and which, with the exception of being rather smaller, was perfectly similar to those of Athens. The frusta of the columns at Baalbec were united with large and long iron pins, centred in square pieces of the same metal. Round the hole, in the surface of the blocks at the Propylæa, is a circular ring elevated about half an inch above the rest of the surface, which fits into a cavity in the corresponding block. Round this ring is another, but not in relief, being only chipped and roughened with the chisel to increase adhesion. The stones of the Propylæa and Parthenon walls are united with iron, and lead. Metal cramps were generally termed *gomphoi* or *chalkeo-gomphoi*. But in Chandler's "Athenian Inscriptions" they are called *sphekiskoi*, from their resemblance to the form of a wasp, being thin in the middle. These are holdfasts, or double tenons, called *securiculæ* by Vitruvius. Thucydides informs us that the stones of the long walls of Athens were fastened with iron and lead.

#### Classic Proportions.

EDWARD CRESY.

An hexastyle portico, including its entablature and pediment, has its masses exactly equal to its voids. The columns taken by themselves, and without any portion of what lies upon them, are equal to one-half the voids, so that the columns and entablature are equal in quantity. The portico of the Pantheon squared in mass contains 7,194 superficial feet, the voids 3,512, so that an octastyle temple as well as an hexastyle temple are established upon the same principle, so curiously that no one would credit it. I have rejected inches and decimals, and call the entablature under the pediment ten feet in height and the pediment twenty, without its raking cornice, the area of which equals that of the entablature. So the entablature, the pediment, and the columns, have masses nearly equal, or divide the 3,512 superficial feet between them, or nearly so.

#### Plasterers' Work in Paris.

C. BARTLETT.

The French artisan has less choice of materials than the English. While the latter has many different cements to work with, the Frenchman has very few indeed, mainly working in that plentiful material plaster (gypsum or sulphate of lime), the coarse being used for rough floating, and for finishing the plaster is sent through a fine sieve. The plaster setting quickly is a great advantage, as it enables them to finish a room off at once, so that one preparation is enough for, say, one room. With us it is very different, as we have to wait for the drying of the different coats, causing delay besides keeping more in hand at one time, and finishing nothing right off. The style of work seems rather wasteful to an Englishman. The French plasterer, for good work, makes use of rules or strips of wood cut thin. These he beds or "sticks" against the ceiling, walls, or partitions, to serve as guides for the floating-rule with which he floats the walls, &c., straight. This adds to the price of the work, the time of the carpenter, and the cost of the timber. With us the system is to form our lines or "screeds" with the materials with which we may be working in cornices, whether for internal or external work. In cornices, whether inside or out, the Frenchman uses more tools than we do. We use straight-edges, or joint-rules of cast steel, with a few small tools; this is all that is required for our intersections or "mitres," but in Paris the workman uses wooden moulds, made to the shape of the various members of the cornice he is forming, said moulds being akin to those used by our masons. This takes considerable more time than we are in the habit of spending on such work. In plain work they use fewer tools than we do. The principal tool is a rather broad, thick, triangular trowel. With this a man lays or spreads on his material, afterwards using one edge as a drag to scrape down all those parts that may be uneven; the work is then finished with a fine coat worked smooth. They are not so particular as ourselves regarding the colour of their plaster. We look with distrust upon high-coloured plaster, well knowing it sets too quickly to be worked properly, with the grave defect of "giving" or softening after it has been laid on for a few hours.

## NOTES AND COMMENTS.

AN exhibition of the works of the members of the Society of Painter-Etchers and other artists will be opened in the Dudley Gallery on May 25, and close on July 4. All forms of engraving on metal are eligible for admission, subject to the approval of the council, and are to be sent in from the 11th to the 14th of May. A commission of 15 per cent. will be charged by the Society on the catalogue price in respect of any works sold during the exhibition.

THE lectures on architecture at the Royal Academy will begin next month. On February 11, Mr. R. STUART POOLE, of the British Museum, will describe "The Cairene House." Mr. BODLEY, A.R.A., will, on the 20th, treat of "Some Principles of Ancient Architecture, and their Application to the Modern Practice of the Art." Mr. PENROSE is to speak about "Greek Architecture" on the 27th. On March 2 and 6 there will be two lectures by Mr. AITCHISON, A.R.A., on "Staircases." Mr. WATERHOUSE, A.R.A., has selected "Westminster Abbey" for his lecture on March 4. It may also be mentioned that, during February, there will be lectures on "Greek Sculpture—School of Praxiteles," by Mr. NEWTON; on "Medals," by Mr. R. STUART POOLE; on "Imitation," by Mr. THORNYCROFT, A.R.A.; and on "Bronze Casting," by Mr. BOEHM, R.A.

THE Louvre lately obtained a collection of sketches by GIACOMO BELLINI, of which photographs have been submitted to the French Society of Antiquaries. They are on parchment, and form part of the same series as those by the painter in the British Museum, and as the history of the sketch-book can be traced, there can be little doubt of its genuineness. There are among the sketches studies from nature, designs for an equestrian statue, views of buildings, landscapes, and biblical scenes. GIACOMO BELLINI was not so famous as his sons GENTILE and GIOVANNI, but anything from his hand is of interest in connection with the early history of the Venetian school.

MR. OWEN W. DAVIS has rendered such good service to the architectural profession as ornamentist and draughtsman, that the announcement of his book, "Art Work," will give general satisfaction. According to the author's statement, the work will consist of a series of artistic compositions, forms and other details, as shown in the various industries employed in the use of marble, stone or terracotta, metal, wood, furniture, and textile fabrics, as well as when used in the various arts associated with decoration. The subjects have been drawn on stone by Mr. DAVIS, and selected from portfolios of notes, sketches, and illustrations which have been accumulated by him throughout twenty years of professional practice. The examples have been taken from Archaic, Antique, Italian, Renaissance, Mediaeval, and Oriental authorities, and will include some of the best unpublished works of the Brothers ADAM, besides details by the late Sir M. DIGBY WYATT, and a few original designs by Mr. DAVIS. There will be 85 plates, containing 550 examples, and, from the specimen we have seen, they will be all clearly executed. The volume will be a general reference book for design. It will be restricted to the subscribers.

A LECTURE which was given by Sir FREDERICK BRAMWELL, at the Institution of Civil Engineers, contains figures that show the difficulties which attend the discovery of a new water supply for the metropolis. It has been found that, out of a total annual rainfall of 27.843 inches, 6.519 inches passes through three feet of soil, and 10.590 inches through the same depth of chalk. The proportion of the percolation to the rainfall varies greatly from time to time, even for the same seasons. Every gallon of water pumped and carried away from an absorbent district is so much abstracted from the flow of the streams of that district. In inland districts the streams form an exact gauge of the excess of the rainfall over the water carried off by evaporation, and any artificial diminution of the water must affect the streams. An annual supply of 4 inches of rain, from

every square mile of country, gives a daily quantity of nearly 160,000 gallons of water, which, at 32 gallons per head per diem, will suffice for a population of 5,000 souls. A population of 4,000,000, like London, will therefore, if supplied from deep wells in the chalk, absorb the total water supply of 800 square miles of country, or of an area one-quarter larger than the county of Hertford, and the whole of the surface streams over this large area will disappear in dry years.

WHILE workmen were lately employed in excavating the foundations of a house in Rome on a plot of ground belonging to the Banca Italiana, and under the direction of M. MARAINI, they made an important discovery. A structure was met with which enclosed the marble tombs of four members of the noble Roman family of LICINIUS CRASSUS, of which mention is often made by historians. It is considered that in its way the discovery is the most important since 1780, when the sarcophagus of SCIPIO BARBATUS, which is now in the Vatican, was found in the Vigna Sassi. It is the only memorial of the CRASSUS family.

THE Heath at Newmarket is hardly the place to expect archæological discoveries, but in levelling a mound some pre-historic arrow-heads and fragments of metal have been found, which are believed to be of great interest. Mr. HUGHES, the Woodwardian Professor of Geology at Cambridge, has undertaken to write a report on the remains. The "ditch" which is known to frequenters of the Heath is supposed to be a part of an immense earthwork, and constructed probably by the Britons. According to another tradition it was the boundary which separated the East Angles and Mercians.

THE proposed district hospital at Newbury is only a small affair, but it has been the means of producing no less than one hundred and twenty sets of plans. In other words, the value of the labour expended on the designs must exceed the contemplated cost of the building. A case of this kind is a revelation of the present state of the profession. Mr. WATERHOUSE is the assessor, and has selected ten designs for further examination.

THE public ought to be wearied of the case of BELT *v.* LAWES; but whenever it crops up there is always a certainty that something surprising will be heard. The application for the discharge of the unlucky defendant in the Bankruptcy Court was not a mere formal affair, for it was announced that one of Mr. BELT's witnesses had confessed that his evidence at the notorious trial was not worthy of belief. Herr SCHOTZ had the generosity to hand Mr. GEORGE LEWIS a statement to the effect that he was the author of the three small sketches of the BYRON Memorial which had been produced at the trial, and which he made for the purpose of deceiving the judge and jurymen; that he was also the modeller of the *Hypatia*; that his time-book was a fabrication; and that, in fact, the affair was to him a speculation, as he was to have a third of the spoil. But what security is there that a man who disregards veracity in Westminster will respect it in Ely Place? The confession of the remorseful witness has been marked, and in the interest of public justice and of English art, the attention of the authorities should be drawn to the document.

A COURT-HOUSE is to be erected in Toronto, and the competition for designs is open to the world. Mr. RENNER, a local architect, points out that, according to the instructions, only 4 per cent. on the contract amounts will be allowed for the services of the author of the selected design, and that all designs, including drawings, specifications, estimates, &c., for which premiums are awarded shall thereupon become the property of the city of Toronto. The drawings must be deposited free of charge. Mr. RENNER considers the conditions to be an insult to the architectural profession, but a little experience of the conduct of the people who get up competitions in England would put the Toronto officials in a new light.

## ILLUSTRATIONS.

## MOSAIC PANELS.

FROM time to time we have published illustrations of figure-pieces in many styles by M. LEMAIRE, of Paris. We now give one of a different class in which tropical plants have been adapted. The design was prepared for the staircase of the building belonging to a financial company, and the ingenuity of the artist will be observed. The semi-circular panels are filled with forms which make those spaces complete in themselves, and in addition they are the completion of the vegetation shown on the lower panels. While a decorative arrangement has been adopted the figures have been depicted with a vigour that makes the conventional treatment appear very cold when placed side by side with those panels. The French decorators are not afraid to act on the Greek saying that "in all things that are natural there is ever something that is admirable," and in works like the one illustrated they compete with the best Japanese designs. The panels show also the surprising versatility of M. LEMAIRE. The mosaics have been carried out by Signor TACCHINI.

## PORCH AND STAIRCASE OF LORD BRABOURNE'S TOWN HOUSE.

THE two illustrations from the house, No. 3 Queen Anne's Gate, Westminster, have been published as exemplifications of the results of SEMPER's teaching. They are described in the letter of the architect, Mr. LAWRENCE HARVEY, which is also published in this number.

## MEYRICK LODGE.

THIS building has been lately designed by Mr. H. E. HAWKER, architect, Bournemouth.

## TWO HOUSES, OLD PARK, ENFIELD.

THESE houses have recently been erected upon a fine site, overlooking a large stretch of open, well-wooded country. The architect is Mr. W. GILLBEE SCOTT, of 25 Bedford Row, W.C., who designed the first of the two houses in the view for his own occupation. They are very substantially built and well finished. All mouldings are to special detail. The ground-floor boards are in  $4\frac{1}{2}$  inch widths, iron-tongued, and  $1\frac{1}{4}$  inch thick. Tile floor in hall, by Messrs. W. B. SIMPSON & SON. All the staircase and watercloset windows have lead light glazing, by Mr. C. H. BREWSTER, which has been very artistically carried out. The doors are all five-panel, and all the furniture was supplied by Mr. JAMES HILL. The door-handles are dull reeded ebony, and the finger-plates, bell-pulls, &c., match them. The baths are white glazed porcelain, supplied by Mr. JOHN FINCH. The walls are faced with red brick, the upper portions being hung with red Bracknell tiles or filets. The roofs are covered with Broseley tiles. All the external woodwork is painted white. The drainage has been carefully executed; all drains have HELLYER's interceptors. The soil-pipes are continued through the roof the full diameter, and finished with BANNER's extracting cowls. The builder is Mr. ALLEN FAIRHEAD, of Sydney House, Enfield.

## THE ARCHITECTURAL ASSOCIATION.

THE eighth ordinary meeting of the Association was held on Friday evening, the 16th inst., Mr. Cole A. Adams, President, in the chair. The following gentlemen were elected members:—Messrs. E. C. Macpherson, G. W. Tait, C. H. Mason, R. W. H. Edis, G. E. Elkington, and S. T. Wenborn.

A visit was announced for to-day (Saturday), to St. Marylebone parish church, Mr. Harris, architect.

The PRESIDENT addressed the members on the subject of the Sketch-book, and pointed out how desirable it was that the work should be supported and contributions made to its funds. In announcing the lamented decease of Mr. Whichcord he spoke of his honourable career, his skill and knowledge as an architect, and of the estimation with which he was regarded as an arbitrator.

Mr. F. R. FARROW then read a paper on

## The Ventilation of Public Buildings.

Mr. FARROW, in the course of his paper, said: Dr. Reid, who devised the original system of ventilation for the Houses

of Parliament, considered that under ordinary circumstances a well-distributed supply of 10 cubic feet per minute was ample. In Germany the usual practice is to supply 10 to 12 cubic feet per minute for schools, 20 to 25 cubic feet for meeting-rooms, and 40 to 75 cubic feet for hospital wards. The Austrians provide from 15 cubic feet for theatres and banqueting-halls, to 25 cubic feet for ball-rooms, council-chambers, &c. In America from 10 to 30 cubic feet, according to the purposes of the room, are given, with an increase to 60 cubic feet in the case of hospitals. Fresh air should never enter at a greater rapidity of current than 2 feet per second, while a rate of 1 foot per second is perceptible at the point of entry. Nor should the temperature for our climate and hygrometric conditions be less than 50 deg. Fahr., this being lower by 20 deg. than is possible in America.

One of the most important and warmly-contested points is the position of the inlets and outlets for the fresh and vitiated air. Are we to introduce our fresh air at the lower part of the hall and extract it at the top, or are we to bring in our fresh air at the top and take it out at the bottom? The advocates of the downward system claim that foul air is heavier than fresh air, and therefore we should extract the foul air at the lower level. But we must remember that our principle is that foul air is heavier than fresh air of equal temperature; and if we look at the source of foul air we see that it is exhaled by the individual, whether from the lungs or from the skin, at a temperature of 90 degs., and therefore, except at this temperature, has *prima facie* a tendency to rise in respect of its warmth, though there is doubtless a counteracting influence by reason of its impurity. The point at which the weight of exhaled air at 90 degs. is balanced by the weight of fresh air is at a temperature of 85 degs. for this latter. If, then, the surrounding temperature is below 85 degs., the foul air rises until it loses so much of its heat as to render it specifically heavier than the normal atmosphere. During this ascensive process, however, it must not be forgotten that, as air is a gas, diffusion is taking place rapidly, and the foul air is therefore, while losing heat, losing weight also by the dilution of its impurities with the purer atmosphere.

Therefore we can see that if fresh air be admitted at the top of the hall it will meet these ascensive columns of vitiated air and become itself adulterated before reaching the occupants, and this adulteration will be in a continually increasing degree until the air breathed by the occupants will be the most vitiated possible for any given supply of fresh air. The descending system has, however, advantages in the avoidance of draught and the equable supply of air to all parts of the room alike. The universal system in Germany and Austria is to introduce the fresh air at the upper part of the room in winter and at the lower part of the room in summer, the extraction being in a contrary direction, so that the warm air in winter, cooling naturally, descends, while the cool air in summer, becoming heated, rises. This method, and the argument in favour of it, depend to a very considerable extent on a very high dew-point, so that there is a far greater chance of success than there would be here in England with a low dew-point. In the case of a hall without ventilation there is a constant rolling stream of air passing upwards from the heating apparatus to the top of the room; then cooling it again descends on the other side of the hall, and so keeps up a constant circulation. If ventilation introduced to such a hall is insufficient to carry off the whole stream of heated air as it ascends, the roll of the atmosphere will not be wholly diverted but will still continue, and thus there may be with advantage an extraction of air at the lower level. But this method of extraction can only be justified for adoption when artificial heating is abundant, and when no gas-lighting is in use to vitiate and heat the upper strata of air. This will accordingly limit the effectiveness of the method to the daytime of a portion only of the winter months, and hence may, I consider, be practically inadvisable in our country.

Our object in ventilating a public building should be to provide an adequate supply of fresh air, uncontaminated as far as possible by contact with foul air, which latter should be removed as speedily as may be; and, further, that an adequate supply may, in ordinary cases, be taken to mean from a minimum of 10 cubic feet per minute for each individual, rising to about 30 cubic feet, according to the use and circumstances of the building. Next, we learn that draught must be avoided by careful regulation of the rate of current, temperature, and humidity of the fresh air, and that vitiation of the instreaming atmosphere will be best by bringing in the fresh air at the lower part of the hall, and extracting the foul air at the upper part. There are three methods by which our object may be attained. We may force in the fresh air, and allow the foul air to escape; we may draw out the foul air and allow the fresh air to enter; or, we may both force in the fresh air and draw out the foul air. The method to adopt must depend both upon the peculiarities of each case, and upon the means which we employ to obtain our end. These means may be divided into two classes, natural and artificial. The arti-

ficial or mechanical means of ventilation may be classed in three groups—the self-acting, those needing a small amount of attention, and those needing constant attention.

Mr. FARROW then described various mechanical appliances, and among them the "Syphon" ventilator of Charles Watson, the various modifications of the "Archimedean screw system," including the "Empress," "Imperial," &c., Banner's cowl, and Boyle's "air-pump" ventilator. Boyle's ventilator had no moving parts, but consisted of a skilful arrangement of curved plates and cross diaphragms, so disposed as to divert any wind-current into such a direction that the principle we are considering may come into operation. A wordy strife had been waged between the partisans of these last two inventions; but, looking at it dispassionately, it might fairly be admitted that each was logical in its idea and efficient in its action. Personally, of the two, he preferred Boyle's ventilator, because it had no moving parts to get out of order, and was more easily enclosed in a turret or flèche, to obviate the fearful ugliness from which all these devices suffered. Verity Bros.' patent ventilator and another, called the Aërophor, now being introduced from Germany by the agents of Messrs. Treutler & Schwarz, of Berlin, were also described.

The PRESIDENT, in opening a discussion, spoke of Boyd's warm-air stoves, used extensively by Mr. Robson in his Board schools, which poured a volume of air into the room, and did not depend on leaky doors or windows for their draught. Tobins' tubes were exceedingly useful, and a down draught might be easily obviated. For cottage houses the ordinary sash window might with advantage have the bottom bead of sufficient height that a current of air might be admitted, Tobin fashion, between the sashes, by raising the lower sash slightly.

Mr. GOTCH proposed a vote of thanks to Mr. Farrow. Systems of ventilation were still far from being perfect, and many elaborate systems would only do for large buildings where money was no object. The system at the Vienna Rathaus seemed to be very effective, and to get over the difficulty of how to distribute fresh air equably to a large or crowded assembly. The members in the House of Commons sat on a grating covered with matting, through which the air passed from large and spacious corridors below. The air was brought into these from the outer courts, and purged of all impurities by passing through muslin, &c. The air, when exhausted of its freshness, made its exit through the ladies' gallery by a grating behind the seats of the occupants, and was conveyed away through a tower and chimney. The ladies' gallery was absolutely the ventilator of the House of Commons.

Mr. TURNER seconded the vote, and said the system at the House of Commons was more elaborate than Mr. Gotch had stated. Air was propelled into the House by fans, and passed out of the Victoria Tower.

Mr. W. H. PRATT thought sufficient cubical contents were too seldom allowed in buildings, especially in churches. He questioned whether it was not a mistake to enclose extracting ventilators in turrets, and did not detract from their efficiency. He thought it was too often made the excuse to get a turret.

Mr. STOKES said the proper principle was to force in a constant supply of warm air. It would find a way out of itself. If they must have an extractor, it should be by way of a safety-valve.

Mr. C. O. ELLISON objected to stoves, because the warm air given off was deleterious if the stoves had any amount of iron surface unprotected by earthenware.

After remarks from Mr. Mountford and Mr. Blagrove, the vote was passed unanimously. Mr. Farrow replied, and the meeting adjourned.

## NEW CHEMICAL LABORATORY AT CAMBRIDGE.

THE plans for the new chemical laboratory, as designed by Mr. J. J. Stevenson, after consultation with Professor Liveing and Professor Dewar, have been approved by the Syndicate, who have issued the following description of the design:—

The proposed new chemical laboratory is designed to stand upon the site of the Perse Almshouses, opposite Pembroke College Lodge, and upon the west side of the Old Botanic Garden. The total length of the frontage from the corner of Free School Lane to the corner of Corn Exchange Street is 516 feet. Of this distance the proposed laboratory will occupy 200 feet, leaving 257 feet between its east end and the present buildings of the School of Human Anatomy.

This site is peculiar, and has entailed some peculiarities in the architectural treatment of the proposed new building. In the first place there is a bend in the line of the street opposite the master's lodge of Pembroke College, which it is impossible to rectify in the new building without a great sacrifice of space on account of the small depth of the ground on which the Perse Almshouses stand. In the next place, it is not possible to put up buildings of more than a very moderate height on the

side next Free School Lane without interfering with the ancient lights of the Perse Grammar School. It is proposed, therefore, to occupy this part of the ground with a large lecture-room and with a porter's lodge, neither of which need be of a lofty elevation. The principal building is connected with this wing at the point where the bend in the street occurs, and the front of it extends eastward about 100 feet, overlapping the new buildings of Pembroke College on the opposite side of the street to about one-third of their length. A one-storeyed wing extends from this in a northerly direction towards the mathematical and botanical lecture-rooms.

The basement is sunk about 5 feet below the level of the street. It extends under the whole building, and in it are provided—beneath the lecture-room, an unpacking-room and two store-rooms adjoining; beneath the main building, a large room, for a metallurgical laboratory and a furnace-room; adjoining it a room for organic analysis and one for such operations as the heating of substances under pressure, a large room 41 feet by 23 feet, to contain a steam-engine, dynamo-electric machines and other machinery, also a lavatory and cloak-room. In the rear of the machine-room is the boiler-room, capable of holding boilers to supply steam for heating the whole building as well as for the steam-engine. Underneath the northern wing are two rooms which are to be fixed with unflammable materials, where such operations as the distillation of ether and other easily ignited substances can be carried on, a small laboratory where a special class of students can work, a store-room, a lavatory, and a small chamber with windows all round it, where experiments with such substances as chlorine or bromine can be carried on.

On the ground-floor the large lecture-room is 40 feet square, and will seat 204 persons on benches rising towards the back. It is 30 feet high to the ceiling. Adjoining the lecture-room and communicating with it behind the lecture-table are the preparation-room and the specimen-room, which are also provided with independent access to the yard and to the store-rooms below, and to a private laboratory and balance-room above. These rooms also serve for the use of two smaller lecture-rooms which adjoin them on the east side. The lecture-room will be connected for the purpose of ventilation with the general ventilating shaft in the middle of the building, and will be provided with a separate draft-chamber for lecture experiments.

The principal entrance to the main building is from Pembroke Street. A rise of fourteen steps from the pavement reaches the entrance-hall on the level of the ground-floor, whence access is had to the two smaller lecture-rooms, each 29 feet by 24 feet, and to the principal range of students' laboratories. The ventilation of the rooms will be provided by means of a ventilating-shaft carried to a height of 100 feet, heated in winter by the fires of the steam boilers, or by a separate fire. In one corner of the large laboratory a small chamber similar to that in the basement, ventilated by windows all round, will serve for operations with chlorine. The balance-room opens through a lobby into the central room, and into the advanced students' laboratory. A closet for sulphuretted hydrogen is placed next the ventilating-shaft and ventilated thereby. Lifts place the laboratories in communication with the store-rooms below. The floors are of wood. The drains are formed of iron troughs lined with asphalt, carried between the joists beneath the level of the floor, covered with movable boards.

On the first floor are two rooms of the same dimensions as the small lecture-rooms on the ground-floor, of which one may be used as a professor's laboratory and the other as a classroom. These rooms also communicate with the private laboratory above the preparation-room. On this floor is also a second range of students' laboratories, consisting of two laboratories and a balance-room of the same dimensions as the rooms below, and another private room for a professor. The largest of the rooms on the ground-floor is not carried higher, but in the attic over it is a large space which may be utilised for some purposes, and the central part of the roof is flat, so that on it such experiments as are best carried out in the open air can be conducted. In the attic there is a considerable space, of which part may be appropriated to chambers for the assistants, and the rest will be available for making and stowing diagrams for spectroscopic observations, and for other purposes which do not require any special appropriations. It is calculated that the students' laboratories will accommodate 175 students working at one time, and if further extension should be required hereafter it can be attained by putting another floor above the northern one-storeyed wing. This would provide room for about 75 more.

The architecture has been throughout subordinated to the necessities and convenience of the building. The first requirements of the building are ample light and thorough ventilation, for which the large windows, divided by stone mullions, are very suitable. This form of window has also the advantage that it permits the irregular arrangement of the floors necessitated by the plan without breaking up the regularity of the

front. To allow the light to reach well into the rooms, the windows are kept square at the top and close to the ceiling, except in the lecture-hall, where round arched windows—which, however, give ample light—seem to be demanded by the architecture.

An approximate estimate has been made of the cost of the building, which, including heating apparatus, comes to 22,000*l.* The usual commission for architect and surveyor and clerk of the works' wages would add between 1,600*l.* and 1,700*l.*, and the special fittings and machinery necessary to a laboratory of this size cannot be estimated at less than 7,000*l.*, making the amount in all 30,700*l.* This sum leaves no margin for contingencies, such as extra foundations, which, from the nature of the site, may possibly be more costly than usual.

## ORNAMENTATION OF WORKS IN IRON.

AN ordinary meeting of the Civil and Mechanical Engineers Society was held on the 14th inst., the president, Mr. Thomas Cole, in the chair, when a paper on the "Appropriate Ornamentation of Works in Iron" was read by Mr. G. Richards Julian, A.R.I.B.A. The author said that if this problem was to be solved at all, it must be done either by the united efforts of the engineer and the architect, or by the development of a new species of workers, who might be denominated artist engineers. The application of artistic principles to the design of structural ironwork had been delayed by the very rapid spread of the use of the materials; the designing had been done in a hurry, and all the real thought had been bestowed on the scientific side of the question. Directly engineering attempted to do anything more than erect structures of simple utility, directly a curve or a moulding was added for the purpose of pleasing the eye, it became amenable to the same artistic laws as architectural design. Mr. Julian then stated those artistic principles which appeared to apply especially to the subject; the avoidance of falsehood either by direct imitation of other materials, or by imitation of forms of ornamentation appropriate to other materials, or by the use of sham constructive features. The modes of expression of proportion, harmony, and contrast were described, and the value of refinement pointed out. These principles were then applied to the design of the coverings of concealed ironwork in fireproof buildings and visible ironwork, both wrought and cast. Attention was specially directed to the ornamental treatment of stanchions as opposed to columns, and to the foliated ornament of Early Greek and of Byzantine work, as possessing the characteristics of crispness and sharpness of outline which should accompany low relief.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

## STEELE'S CHARACTER OF SIR CHRISTOPHER WREN.

The fifty-second number of the *Tatler*, which appeared on August 9, 1709, and was composed in White's Chocolate House, contained the history of the beauteous Delamira, and from it "Mr. Bickerstaff" was led to consider the subject of modesty in men. He came to the conclusion that the Frenchman was right in saying that modesty is to the other virtues in a man what shade in a picture is to the parts of the thing represented. It makes all those beauties conspicuous which would otherwise be but a wild heap of colours. This shade in our actions, said the moralist, must therefore be very justly applied, for if there be too much it hides our good qualities instead of showing them to advantage. As the most striking example of the dangers of an excessive modesty and reticence about one's own merits, Steele referred to the career of "Nestor," or, in other words, to Sir Christopher Wren, who was then an old man of seventy-seven, of whom he drew the following picture:—

"Nestor in Athens was an unhappy instance of this truth; for he was not only in his profession the greatest man of that age, but had given more proofs of it than any other man ever did; yet for want of that natural freedom and audacity which is necessary in commerce with men, his personal modesty overthrew all his public actions. Nestor was in those days a skilful architect, and in a manner the inventor of the use of mechanic powers, which he brought to so great perfection that he knew to an atom what foundation would bear such a superstructure. And they record of him that he was so prodigiously exact that for the experiment-sake he built an edifice of great beauty and seeming strength, but contrived so as to bear only its own

weight and not to admit the addition of the least particle. This building was beheld with much admiration by all the *virtuosi* of that time; but fell down with no other pressure but the settling of a wren upon the top of it. Yet Nestor's modesty was such that his art and skill were soon disregarded for want of that manner with which men of the world support and assert the merit of their own performances. Soon after this instance of his art, Athens was, by the treachery of its enemies, burnt to the ground. This gave Nestor the greatest occasion that ever builder had to render his name immortal, and his person venerable. For all the new city rose according to his disposition, and all the monuments of the glories and distresses of that people were erected by that sole artist. Nay, all their temples, as well as houses, were the effects of his study and labour, inasmuch that it was said by an old sage, 'Sure, Nestor will now be famous, for the habitations of gods, as well as men, are built by his contrivance.' But this bashful quality still put a damp upon his great knowledge, which has as fatal an effect upon men's reputations as poverty; for as it was said the poor man saved the city, and the poor man's labour was forgot, so here we find the modest man built the city, and the modest man's skill was unknown. Thus we see every man is the maker of his own fortune, and, what is very odd to consider, he must in some measure be the trumpet of his fame. Not that men are to be tolerated who directly praise themselves, but they are to be endued with a sort of defensive eloquence, by which they shall be always capable of expressing the rules and arts by which they govern themselves."

When alluding to the edifice which bore its own weight, Steele probably had in view the flat roof of the Sheldonian Theatre at Oxford, measuring 80 feet by 70 feet, and in which Wren dispensed with columns. The object of the apologue in the *Tatler* was to support the architect in his struggle against the Commissioners, who wished to deprive him of the greater part of his modest salary of 200*l.* for superintending the works at St. Paul's. It would have been risky for Steele to be more outspoken, for he held the offices of Gazetteer and Gentleman Usher. Wren was paid the balance that was owing to him in 1711, and he lived until 1723.

## AN ITALIAN PAINTER'S INDENTURE.

It was a common practice in Italy, in the fifteenth and sixteenth centuries, to place a boy who was considered likely to become a good artist under the care of a master who lived in a distant town. Raphael, for instance, came to Perugia from Urbino. The document that is published below throws a light on the conditions of apprenticeship in cases of the kind. Bartolommeo, or Baccio della Porta, who was one of the four great painters of the Florentine school, was impressed by the eloquence of Savonarola. He was present among the Piagnoni when the attack was made on the reformer, and was so frightened at the bloodshed that he resolved, if his life were spared, to become a friar. Porta had a younger brother, to whom he made over his property and patrimony. During the novitiate of Porta the care of Pietro was undertaken by the Prior of St. Mark's Convent. When it was supposed that the younger brother had artistic ability he was placed with Mariotto Albertinelli, the painter, who had been a fellow-pupil and a partner of Fra Bartolommeo. The following is the apprenticeship deed, which probably was based on a form that was more common in the fifteenth than in the nineteenth century:—

*Contract between Fra Bartolommeo della Porta and Mariotto Albertinelli, by which the latter binds himself to administer the property of Pietro del Fattorino, and to teach him the art of painting.*

January 1st, 1505.—Be it known to all who will see or read these presents, that Fra Santi of Lucca, O.S.D., and now prior in the convent of S. Marco in Florence, has bound Piero di Paolo to Mariotto, son of Biagio, for the term of six years, commencing on the 1st of January, 1505, and terminating on the 1st of January, 1511. And it is agreed and stipulated between said Prior and said Mariotto that the latter shall teach Pietro the art of painting, laying on gold, &c.; and that Pietro shall in all things prove his obedience to said Mariotto, without any remuneration or reward from said master during the term of six years. And the aforesaid parties are agreed that all the property inherited by said Pietro from Paolo, son of Jacopo (del Fattorino), shall be administered, preserved, and turned to the best advantage by Mariotto, who binds himself to take diligent care of said property, providing, like a good and faithful administrator, that it shall sustain no detriment. All this property shall belong to Mariotto during the term of six years; and he shall be empowered to receive all its fruits and rents during said term. The property is hereinafter described, to wit:—A house, situated in the parish of S. Pietro Gattolini, and a vineyard, together with other pieces of arable ground in said parish; and another vineyard and some lots of ground

and woods in Val di Neve, together with one hundred and eleven florins, at seven per cent, now in the bank of the commune at Florence. And said Mariotto binds himself to lodge and diet said Pietro in his own house, and to shoe and clothe him according to his condition. And provided Pietro should ask Mariotto for money, he shall not be bound to advance him more than seven soldi per month. But in case Pietro should not ask him for money, said Mariotto shall not be bound to give it or to make it good to him at the expiration of said term. Said Mariotto, moreover, shall be bound to have an office celebrated for the repose of the soul of Paolo (del Fattorino) each year in the church of S. Pietro Gattolini, and he shall be bound to give the priest the sum of two lire and two pounds of wax candles, according to ancient usage. And the aforesaid parties have agreed that all the parties having claims on, or indebted to, said property shall apply to said Mariotto in order to receive what may be due to them, or to pay what they may owe according to the pleasure of Mariotto, who, as a good and faithful administrator, will keep an accurate account of all payments and disbursements, and give satisfaction for same after the expiration of six years. And they are also agreed that Mariotto shall receive as much money from the debtors as may be required for the clothing of Pietro, the improvement of his land, and the repairs of his house in Val di Neve. And in case Mariotto should not be able to raise so much money as would be required for these purposes, he shall expend thereon his own money, for which he shall be indemnified at the termination of six years, as it shall seem good to the then prior of S. Marco in Florence. And in case that Mariotto or his heirs should not think well of retaining said Pietro, he shall be at liberty to dismiss him on the aforesaid conditions; and should said Pietro wish to leave the tutelage of Mariotto or his house, without completing the term of six years, said Pietro shall be bound to indemnify Mariotto according to the adjudication of whoever may be the prior of S. Marco in Florence at the period. This provision has been made lest Pietro should malign said Mariotto, or have learned the art of painting too quickly, for it is only just that said Mariotto should be indemnified for the time and labour which he undertakes to devote to teaching Pietro. Moreover, said Pietro, with the consent of said prior, and in presence of Fra Bartolommeo, his brother, agrees in case he should leave Mariotto or his house either before or after the expiration of said term (six years) that he shall not be empowered to let the vineyard situate in Val di Neve to any other than said Mariotto at a reasonable valuation. And it is provided also that in case he should be disposed to sell said vineyard, he shall not be empowered to sell it to any other than the said Mariotto, for a sum to be determined by four men of the district. And in case Pietro should die without natural or legitimate children within the term of six years, or after the expiration of the same, whosoever inherits said vineyard shall be bound to sell it to Mariotto, or his heirs, for a reasonable consideration. And as to Mariotto and his heirs, should he or they be disinclined to purchase the said vineyard, it shall be optional with them to sell or retain it, as they may think fit. And it is also provided if anything should occur within this period involving Mariotto or Pietro in any heavy loss, that the whole matter shall be submitted to the actual prior, and that he shall be empowered to introduce additional clauses in order to make good said loss. Mariotto and Pietro shall agree to all these conditions, and oblige themselves to the observance of the same in all and every particular, and the prior of St. Marco attests all this with his own sign manual. Mariotto, Pietro, and his brother, Fra Bartolommeo, shall subscribe with their own hands said conditions; and there shall be made two copies of this instrument, one of which shall remain with the aforesaid Mariotto, and the other with the Syndic of the convent of St. Marco.

I, Niccolo di Piero, at the instance of the aforesaid parties, have signed this instrument, January 1st, 1505, and they shall subscribe their names at foot of same. I, Fra Santi Pagnini, now prior of St. Marco, in Florence, by virtue of the authority given me by Fra Bartolommeo over his brother, Pietro, when he transferred his heritage to him, consent to and promise to enforce the observance of the aforesaid conditions. And I here sign my own name in said year, month, and day. I, Fra Bartolommeo, brother of Pietro, pledge myself to the said arrangements, and I hold that Pietro is bound to the same. Wherefore I put my signature to this on said day and month. I, Pietro di Paolo (del Fattorino), pledge myself to the observance of all said stipulations, and I bind myself to observe all that has been agreed upon between said prior and Mariotto. This I have done with the consent and at the instance of my brother, Fra Bartolommeo, and have put my signature thereto on this 1st of January, 1505. I, Mariotto, son of Biagio, painter, with the permission of my father, hold myself bound by said provisions, and hereunto append my signature. My father shall also subscribe same. I, Biagio, agree to the said conditions, and oblige my son, Mariotto, to the observance of the same, and I here append my own sign manual.

As is not unusual with lawyers' work, the foregoing deed

was not of much use to the parties concerned. Mariotto, although an excellent painter, had a good deal of the Bohemian about him. The relation between him and his pupil was soon dissolved, and the Historic Muse has not troubled herself with the fate of Pietro. But by one of those strange vicissitudes which mark Renaissance art history, the broken-down Mariotto and the friar once more became partners. When the partnership was dissolved, in consequence of Mariotto's preference for tavern-keeping, there was a division of the property in the studio, and from the inventory we find that lay figures were then used.

### SCHOOL BUILDINGS.

**Cardiff.**—The Higher Grade School, which has been erected from the designs of Messrs. James, Seward & Thomas, of Cardiff, has been completed, and informally opened. The style may be described as English Renaissance. The front elevation, which is about 150 feet in length, shows a central block, surmounted by a turret, rising to a height of about 70 feet, a central pediment, and a gable on either side. The chief material is local fire-brick of yellow tint, the mortar joints red; the dressings are of Bath stone, interspersed with grey Bridgend stone and courses of red brick. The roof is composed of green slate, finished with red tile crests. The works have not exceeded the amount of the original contract price, 9,200*l.* The contractor is Mr. C. Burton, of Cardiff.

**High Wycombe.**—New school-rooms have been erected, and were on Sunday the 11th inst. formally opened in connection with the Union chapel, High Wycombe. The buildings comprise school-room, 50 feet by 24 feet, with lavatories, out-buildings, &c., and the construction out of the old school buildings of six class-rooms, large organ and choir chamber at the rear of the pulpit platform. The galleries and part of the building have been repaired, and the whole decorated, at an expense of about 1,200*l.*, by Mr. G. H. Gibson, contractor, High Wycombe, under the direction of Mr. Arthur Vernon, of 26 Great George Street, Westminster, and High Wycombe.

**Middlesbrough.**—The Board schools erected in Newport Road have been opened. The schools have been built by Mr. Jos. Lord, from the designs of Mr. W. H. Blessley, in Queen Anne style of architecture, and will accommodate 978 children, 284 in the boys department, 284 in the girls, and 410 infants. Each department is furnished with three class-rooms and a school-room. The cost of erecting and furnishing is 7,036*l.* 19*s.* 6*d.*, and the total cost will be close on 10,000*l.*, averaging about 10*l.* per child accommodated.

**Wooburn Green, Bucks.**—A large class-room has just been added to the National School, Wooburn, of brick, flint, and slate, and an ornamental Early English fountain has been erected for the accommodation both of the children and passers-by. The builder was Mr. C. H. Hunt, and the architect Mr. Arthur Vernon, High Wycombe.

**Wycombe Marsh, Bucks.**—New National Schools in connection with St. Anne's Church have just been completed and opened. They contain a large room and class-room, and are constructed in the Early Gothic style, with red bricks and dark tiles. The outlay for 100 scholars has been 350*l.*, Mr. W. R. Loosley, of High Wycombe, having been the contractor, and Mr. Arthur Vernon, of 26 Great George Street, Westminster, and High Wycombe, the architect.

### NEW BUILDINGS.

**Belfast.**—The new Ulster Reform Club has been informally opened. The contract for the building and most of the interior finishing has been carried out by Mr. James Henry, of Belfast, under the plans and superintendence of the architects, Messrs. Maxwell & Tuke, of Manchester.

**High Wycombe.**—The useful Cottage Hospital of this town has been recently enlarged from the accommodation of twelve to sixteen beds, a new ward having been constructed, called the Augusta Ward, from the gift of 100*l.* made by her family in memory of the late Lady Carrington. The builder was Mr. J. T. Harris, and the architect Mr. Arthur Vernon, both of High Wycombe.

**The Aberdeen University Authorities** propose to enlarge Mareschal College, to meet the requirements of the medical school, either by the erection of buildings which will complete the present imperfect quadrangle, or by converting Greyfriars Church into a college hall.

**The Bournemouth Improvement Commissioners** on Tuesday decided to carry out a scheme for an undercliff carriage drive and promenade, upwards of two miles in length, along the whole of the sea frontage. The scheme has been estimated to cost about 25,000*l.* It is also in contemplation to construct new landing-piers at Boscombe and Southbourne, two suburbs.

### Semper's Theory of Evolution and its Practical Utility Illustrated.

SIR,—From Professor Baldwin Brown's letter of Dec. 31 we find that, according to Semper, the art of architecture was from the first an art of expression, just like poetry, and revelled in masking prosaic realities; "for the smoke of the carnival taper," says he, "is the true atmosphere of art." That Semper is not singular in this conception of architecture I admit, for the great French architect Duban defined his art *une décoration construite*; still this is Semper's teaching, which differs essentially therein from those who consider architecture as the handmaid to utilitarian purposes.

The drawings I beg to present as illustrations\* of the practical influence of Semper's teaching are from alterations which I made some years ago to the house No. 3 Queen Anne's Gate, now occupied by Lord Brabourne. The house I had to deal with consisted of the parallelogram which now forms the front part of the building. The storeys were low, the floors were rickety, the centre was occupied by a shabby dog-legged staircase, the exterior consisted of plain walls, with window openings as ornate and proportionable as those of a vagrant ward; the view to the north looked out into a gloomy street, to the west it enjoyed Little Carteret Street, enlivened by various mews; to the south it overlooked the back courts of Little Dartmouth Street. The job seemed as unpromising as it well could be, but yet it did not damp the courage of Semper's pupil, who only saw in all these miserable surroundings a stronger reason for changing the place into an ideal scene, which should be its own picture. The old staircase was cleared away, and its place was taken by a small entrance-hall covered with a low cupola, and paved with a marble mosaic. Then follows an inner hall with a slightly coffered ceiling, doors and finishings in oak, which give it a warmer appearance than the entrance-hall. From here starts the grand staircase, which the visitor ascends under a delicate cupola, and discovers at every step new and unexpected vistas. A balcony opens out from the drawing-rooms as a place of vantage to contemplate the gay throng, "*à la Paul Veronese*," which it was hoped would one day animate this staircase as the beautiful ladies and their brilliant cavaliers passed on from the upstairs ball-rooms to the festive board provided in the dining-rooms downstairs. The whole conception smells, as Semper defines art, of the carnival taper; it is an attempt at a poem in bricks and mortar. Does it pay? My client could best answer that question, but we can guess his opinion by the fact that he has employed me again since, and recommended me to his friends. The utilitarians forget that our wants are not solely physical, and this leads them into many a mistake both in art and in politics.

My second claim for Semper's teaching is that it enfranchises his followers from the tyrannical trammels of precedents; and whatever may be "*Cui Bono*'s" opinion on my work, he may like it or abhor it, but he cannot refuse that the architecture of this house is a specimen of Classic style treated with remarkable freedom of handling. If we limit our observations to the porch only, we shall find a Doric order eight and a quarter or nearly ten diameters high, according to how we measure it, instead of the legal seven or seven and a half of Palladio, surmounted by a most capricious-looking entablature; instead of the regulation Doric bases the shafts of the columns spread out, and the scrapers below them fulfil the functions of the missing bases.

It remains to be shown that this composition is the outcome of Semper's teaching, that it is not a caprice, but the result of meditations on the origins of art, and the various meanings of every feature we employ in architecture.

I must begin by explaining that I was not free in the selection of the general proportions of this porch. My client, a lover of old work, wished to preserve both the entrance door and the woodwork of the window above in the first floor, and only decided when nearly all the work was completed on having a porch at all. The problem to be solved was, therefore, given certain proportions, more or less disagreeable, render them less so—a problem which racks the brain of many a lady when she is selecting the bonnet or the dress which shall suit her best. Let her, if she be short, avoid flounces; if she be tall, let her beware of vertical lines and stripes.

The weak point of all porches, especially when added to a perfectly plain building, is to look entirely disconnected from the building itself. To avoid this reproach, I treated both the porch and the window above it as an architectural composition in stone inserted in the brickwork, and characterised it as part of the wall by emphasising the stone courses: so far there is nothing very new. The distance between the wall pilasters and

the columns is 3 feet, the distance between the two front columns is 8 feet. It is therefore evident that an architrave which would not be too heavy, but only of the proper proportion to bridge the space between the pilaster and the column, would prove much too slight when spanning the opening between the columns. I overcame this difficulty by, firstly, adopting as depth of the entablature a dimension which appeared sufficient for a stone to span safely the larger opening between the front columns, then I carried a stone beam from each column to the wall. The lower part of these beams are treated as architraves, the horizontal facias of which so well symbolise their elastic functions, like the fibres of wood. The architraves have the depth which seemed to me in proportion with the smaller openings spanned; what remained above the top architrave moulding I treated as a frieze, and to strongly mark that this part is not necessary to the bearing qualities of the stone, it is covered with vertical flutings, which destroy all idea of continuity in this surface. In the part of the entablature which faces the street I inserted circular bosses, which destroy the continuous line of the architrave, and obtained thereby a double result; firstly, an apparent shortening of the span for the same reason that flounces diminish the height of a lady; secondly, the continuity of the architrave being destroyed, the eye is obliged to take in the whole of the entablature as the elastic bearer between the two columns, and therefore is satisfied as to its solidity. I beg to point out that without any precedent known to me, I have ventured to carry out exactly in stone the very construction such framing would have if the entablature had been formed of wooden beams. The side beams project beyond the front beam, and thereby disguise an ugly joint; this is true to the precept of Semper when speaking of the artistic importance of seams. They teach us to make a virtue of necessity, in other words, to make the unavoidable constructional requirement the very motive of your artistic composition, as is seen in the seams of Oriental leather wares. I have also obtained another advantage by this marked difference of treatment between the sides and the front of the porch. I have emphasised the idea that this porch is only entered in front, and differs thereby from porches which are entered on all sides. This is also a refinement of feeling to which I have been awakened by Semper's teaching, for he consecrates many a chapter of his book to pointing out how we should indicate the direction of things according to their use.

Semper tells us that architecture has two ways of arranging transitions. In the Ionic temple, the passage from one feature to another is emphasised by a moulding which separates the two parts; such is the top moulding of the Ionic, and also of the Corinthian architrave. In Doric work we find features which we can call preludes, analogous to preludes in music: such are the guttæ under the triglyphs. It is evident that if we had never seen a Doric temple, but only found a piece of an architrave, we should have been sorely puzzled by these guttæ recurring at regular intervals, and probably we should have come to the conclusion that something was fitted over them. We see thereby that preludes connect all parts of a composition together more powerfully than transitions, or say mouldings; for, with preludes, each part is itself imperfect, and cannot even be conceived as an independent object. This is the consideration which has induced me to treat the scrapers and the plinths as forming the moulded bases of the columns they support; the very hollow of the scraper itself emphasises the elastic reactions of these bases and must be considered as part of the column, which, in that case would be nine and three-quarter diameters high.

Purists will find fault with the bands which cut up the shafts of the columns. If we interrogate Semper, we shall find there are two elements of form: the one is the purpose, the other is the material we have in hand. I admit that the ideal of a column is to have one continuous outline from base to cap, and that such should be its treatment when formed out of marble, or such fine-grained materials as allow of sharp outlines; but I had to deal with Bath stone, the edges of which are always more or less rugged. Flowing lines with or without flutings would have been imperfect: by breaking them up I believe I have adopted a style proper to the coarse material I had to employ, just as, according to Semper, before the discovery of the potters' wheel, when vases were modelled by hand only, the makers disguised the imperfection of their general form by covering them with ornaments in bold relief.

I have now made a clean breast of the motives which guide my designing, and hope "*Cui Bono*" will admit that the study of Semper may have great influence on the work of an artist, although he is quite free to utterly condemn the result.

I beg to warn my colleagues against considering the architecture employed in this house as a specimen of Semper's own style, or even of my style. It is simply the application by myself of Semper's principles to a special case; but any architecture whatever can be adopted, and yet be thoroughly Semperian. A Gothic architect, for instance, has only to throw aside all archaeological crazes, and, by dint of careful study of old and modern buildings, find out the full artistic value of

\* See Illustrations.

every feature of Gothic work, then use them freely as the words of a language in which he writes his own ideas, in harmony with his personal feelings, the wants of his fellow-men and the materials as well as the scientific knowledge we now possess, and this Gothic architect will be a Semperite, even if he has never heard of Semper, just as there may be many a true Christian amongst the savages of Central Africa, loving his fellow-men as Christ has ordained, although they have never had the advantage of hearing either His name or His doctrine.

LAWRENCE HARVEY, A.R.I.B.A.,

Pupil of the late Professor Semper, Medallist of the Paris Ecole des Beaux-Arts.

#### Semper and Semperism.

SIR,—If you and your readers are not already tired of this subject, I hope you will allow me space for a few words of reply to your correspondent on "Utilitarianism in Education."

In the first place, Semper's book on "Style" is not about architecture as the building art so much as about the decorative arts, which are subordinate to it. The book makes no pretence to supply a set of rules for the erection of buildings. What it offers is a systematic treatment of the subject of ornament, and copious illustrations of decorative principles drawn from the great works of the past. With these are joined discussions and suggestions relating to the history and philosophy of the arts, which to the non-technical reader make the chief interest of the work. Now, with regard to the "use" of all this, of course no one ever supposed that opinions as to the primal origin of architecture have the least effect upon the practical work of an architect of to-day. Such questions may naturally have a special interest for architects, just as questions on the theory of musical effect interest the musician; but in neither case is practice in the least influenced. These views and observations of Semper, which occur throughout his work, but form only a small portion of it, have their value quite apart from any effect on the construction of modern buildings or on the art of capturing clients, and this value is sufficiently proved by the constant expressions of indebtedness to Semper which are to be found in recent works dealing with the subjects on which he wrote. The case is different with Semper's treatment of "style in the arts." Here there is no possibility of denying the practical value of his work. I do not hesitate to say that an acquaintance with Semper would "increase a student's powers, and enable him to design better buildings." It would do so not by explaining construction or entering into technical questions, but by educating his artistic taste, and rendering him familiar with the great masterpieces of old time. No doubt Semper, as himself a practical architect who carried out many important buildings, was as much at home in "the strength of materials" as in matters artistic, and his pupils will know what was the value of his technical teaching. "Der Styl" deals with the artistic side of the architect's work, and not so much with the planning as with the decorative treatment of buildings. In these matters his teaching seems to me singularly able and practical, and to have nothing at all of the "ism" about it. It is not, as I mentioned in a former letter, specially original, and demands the swallowing of no special theory.

It will evidently be a surprise to "Cui Bono" to hear it stated that Semper, though a foreigner and a professor, was not a doctrinaire, and that his "rigorous system" exists nowhere out of "Cui Bono's" imagination. Mr. Lawrence Harvey, who knows much more about Semper than I do, has told us, on his personal authority as an old pupil, that Semper's teaching "leads to liberty," and has given no ground at all for your correspondent's supposition that this liberty was only to be reached through a reaction from the master's actual influence. I know Semper only from his published writings and the various records of his work in connection with the Science and Art Department, and I have gathered from these that he was a teacher who desired, above all things, to call out the student's powers into independent exercise. His "system" seems to have consisted in impressing upon the learner the importance of realising clearly everything that he was doing. There should be a reason, he taught, for everything, and all the parts of a work should hang together, so that the whole becomes an organic unity. In order to enforce this practical principle, Semper surveyed the previous history of the arts, and by showing how the decorative forms used in various styles originated, and how they were employed by the masters of old, took them at once out of the region of mere caprice and fashion.

"Cui Bono" doubtless believes in a more excellent way, and imagines, as he tells us, the builder of the future erecting his economical and convenient structures strictly on builders' principles, and then offering to his client as a luxury for after consideration, "as much ornament as he wishes." He seems to think that public taste is rapidly deteriorating down to a point when architecture will cease to be looked upon as a fine art. I fancy, however, that it will be long before he gets the public on his side. I prefer to believe that the public taste is advancing

in the direction of better things, and that everything which spreads a knowledge of art and elevates taste by calling attention to the best models will be welcomed by both artists and the public. "Cui Bono" does not need to be told that in the decorative or industrial arts, with which Semper's "Style" chiefly deals, the workmen of this country have lost ground as compared with their foreign neighbours. The reason is the higher artistic quality of foreign productions, and this is due to the fact that foreign nations have not pooch-pooched their Sempers, but have cultivated a genuine interest in art by every means in their power. If in these branches of production we are to "bring back clients," it must be by encouraging by every means in our power the development of artistic taste, and not by listening to outcries against anything which seems a little systematic. By all means let books on the strength of materials be written and studied to the utmost possible extent. These belong to another and vitally important branch of the architect's work, one which the great builders of old fully understood. But excellence in this respect should go hand in hand with artistic excellence. To cry down the importance of the latter, as "Cui Bono" cries it down, is dishonouring to the profession to which I must presume he belongs. Let us learn all that is to be learned from engineering practice or from any other source, but let us not even in jest—and I cannot believe "Cui Bono" to be quite serious—attempt to lower the position of the art to which we owe the creation of monuments that are among the most precious possessions of the human race.

University of Edinburgh:

Jan. 19.

I am, &c.,

G. BALDWIN BROWN.

#### GENERAL.

**The Queen** has contributed 20*l.* towards the cost of renovation and reseating the Congregational Church at East Cowes.

**M. H. Fantin Latour**, of the Institute of Painters in Oil Colours, has received the Cross of the Order of Leopold.

**Prince Bismarck** has opposed the proposition to establish a normal working day in Germany.

**Mr. J. Charlton** having completed the equestrian portrait of Sir Nathaniel de Rothschild, commissioned by the tenant farmers and tradesmen of the Vale of Aylesbury, it has been presented to Lady N. de Rothschild.

**M. Vibert's** *Christian Martyrs* is now being exhibited in Manchester. The subject is not pleasing. It is a representation of two early converts left chained in a wilderness. The woman has been killed by a lion, and the man is about to share his companion's fate.

**The Bishop of Malaga** proposes to raffle three paintings, by Morales, Andrea del Sarto, and Ribera, in order to obtain money to defray part of the cost of rebuilding houses in the city which have been destroyed in the earthquake.

**Mr. James Bertwistle**, of Blackburn, has been appointed architect for the proposed St. John's Schools at Great Harwood, which are to accommodate 930 children.

**Sir Henry Bessemer** has been presented with the honorary freedom of the Company of Armourers and Braziers.

**The Royal Scottish Academy** will open its fifty-ninth annual exhibition on February 14.

**The Spring Exhibition of the Manchester Academy** will be opened to the public on February 11.

**The Exhibition of Pictures at Wolverhampton** closed on Saturday. The attendance during the two months it was open has not been encouraging to the promoters. The art gallery will be reopened when the works of art belonging to the town have been rearranged.

**Mr. John Holden, F.R.I.B.A.**, on Wednesday, gave a lecture on "Foundations and Materials," one of a series on house construction and sanitation, promoted by the Manchester and Salford Sanitary Association, at the Technical Institute, Manchester.

**Mr. T. M. Lindsay**, of Rugby, has lectured in Nottingham on "Etching, Mezzotint, and Aquatint."

**Mr. J. C. Clarke**, M.P. for Abingdon, proposes to build a cottage hospital in the town at his own expense.

**Messrs. T. Lawrence & Son** have supplied the red rubber bricks used in the new White Horse Cellar Hotel, Piccadilly.

**Mr. B. Priestley Shires** will read a paper on Thursday next, before the York Arts Guild, on "Domestic Life of the Edwardian Period as shown by the Architecture."

"**Sunlows**," near Kelso, the mansion of Mr. William Scott Kerr, has been destroyed by fire. The loss is estimated at from 25,000*l.* to 30,000*l.*

**Messrs. Godwin & Son**, of Lugwardine Tile Works, Withington, have offered as a gift the tiles to pave the portion of Whitecross Church, Hereford, already built.

**Mr. Joseph Cox**, the Borough Surveyor for Leominster, has just died in his 76th year.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JANUARY 24, 1885.

## AN AMATEUR BUILDER.

ON Saturday an action was taken by John Adams, a bricklayer, to recover compensation for personal injuries alleged to have been caused through the negligence of the defendant, Mr. Cox, of Portobello Road, London. It should be a warning to those who believe in the principle of "Every man his own builder." In September, 1883, the defendant wished to add a storey to a house, and being of a thrifty turn, resolved to dispense with a builder and to superintend the works himself. The plaintiff was employed to underpin a certain wall with Portland cement. Some navvies were engaged as well. It was afterwards discovered that the 9 feet underpinning was not of sufficient depth, and he (defendant) ordered the navvies to dig out another 18 inches preparatory to further pinning. On October 29 the plaintiff went there at 4 A.M. and found that the navvies had excavated the entire length of the wall, 18 inches below his original underpinning wall. The defendant was handing him bricks, and had only left about five minutes, saying, "Look sharp, as I expect the district surveyor." The plaintiff went down the cutting at once to continue the underpinning, when down came the whole wall. There was no means of escape, and he was knocked over by it and had his legs broken, and was in hospital fifteen weeks.

Medical evidence was given that both the plaintiff's legs had been broken, the fractures being of a very serious character. The jury found a verdict for the plaintiff—damages, 100*l*.

## BUILDERS' ACCOUNTS.

A CASE which was heard before Mr. Justice Wills on Saturday will suggest the necessity of precision in dealing with clients, and that receipts for money should be in writing and explanatory of the reasons for which the money was given. The defendant, Mr. Glashier, obtained a lease of a house on the Bedford Park Estate on condition that he executed certain repairs. He therefore entered into an agreement with Mr. Davey, the plaintiff, a builder, who executed the necessary repairs, and sent in his bill in accordance with the specification, and a further amount for extras. The defendant paid the amount incurred under the specification, but disputed (he said) on principle the amount claimed as extras. At an interview with the plaintiff's surveyor, the defendant's solicitor paid, by cheque, 44*l*. 2*s*. 6*d*., in full satisfaction, as he said, of the plaintiff's claim for extras. That this cheque had been so accepted the plaintiff maintained was incorrect, and that, in fact, it had been merely taken on account. It was admitted that the cheque had been cashed by the plaintiff. The plaintiff's case chiefly depended on the conversation which had taken place at the interview alluded to, the details of which, and the evidence thereon, were very complicated, the plaintiff contending that the cheque was merely accepted on account, while the defendant's solicitor contended that it was given in satisfaction. It appeared that

at this interview, and during the dispute, the defendant's solicitor had intimated that his client would not pay more than the 44*l*. odd, and was prepared to give the plaintiff a cheque for that sum at once, and that if he wanted the balance he would have to go to a jury for it. The cheque was thereupon taken by the plaintiff.

At the suggestion of Mr. Justice Wills, it was agreed to take the opinion of the jury on the question as to the payment being in satisfaction of the account.

Mr. Justice Wills, commenting on the interview between the parties' representatives, said there appeared to have been a *bonâ fide* dispute as to these extra charges, the defendant saying he disputed half the items thereof on principle; the remaining amount—viz. 44*l*.—he did not dispute, and said he would pay. As regarded the other sum, however, he said he refused to pay it. To facilitate a final settlement of the matter, and so avoid litigation, the defendant's solicitor had apparently done what in such cases their own experience would tell them was always done between gentlemen—viz. had stated the whole case without reserve, so that each disputant might see and realise what the case was for and against him. His lordship had always considered that in such cases any admissions that might be then made by either side were confidential and without prejudice. But in this case he was sorry to say this had not been so, and it had been sought, on behalf of the plaintiff, to set up such a class of evidence with a view of establishing his case. Such a course he could only designate as most shabby, and this instance was perhaps the shabbiest he had ever in his very long experience known, and it was deserving of general reprobation.

The jury found that the money was paid and received in satisfaction of the whole amount owing.

Mr. Justice Wills gave judgment, dismissing the action with costs.

## ARTESIAN BORING AT VANGE, ESSEX.

IT will be remembered that early last November Messrs. Legrand & Sutcliffe, of London, struck chalk in this boring at the depth of 524 feet, after passing through 395 feet of London clay and 129 feet of the lower tertiary beds. A further 201 feet has now been penetrated into the chalk, making the total depth reached 725 feet, and a sufficient supply of water has been obtained for the purpose of large local brickworks. A feature of interest is the peculiar nature of the chalk met with. As a rule, in the London basin it is generally considered that, unless water be found in the first 150 feet of chalk with the usual layers of flints, it is but little use boring deeper in search of a supply from the lower chalk. In this instance the first 150 feet was practically waterless, the character of the chalk partaking more of the nature of a stiff marl of a dark mottled colour, with scarcely any flints in it; and it was not until this bed had been passed through that regularly stratified layers of white chalk and flints appeared, and from which a supply of water was gradually

developed in the last 50 feet bored. The actual time occupied in boring the last 200 feet was only seven weeks.

## JAPANESE PAPER.

THAT Japanese paper is daily growing in public favour and appreciation is not surprising, considering the number of decorative purposes to which it can be applied, and its comparative cheapness. Some very fine specimens of this material may now be seen at the show-rooms of Mr. Robert Christie, 102 George Street, Portman Square, who has just received a large consignment, consisting of over one hundred new patterns, comprising among them some of the finest, as regards design and colouring, which have yet been introduced into this country.

## CHURCH FONT.

A HANDSOME font, complete with brass cover, has been presented to the new church of St. Agnes, Moseley, near Birmingham. It is of Caen stone, with quatrefoil marble columns, the carving of the capitals and that round the bowl being in the Early English style, in harmony with the architecture of the church. The work has been carried out by Messrs. Jones & Willis, of Birmingham and London, who also supplied the choir-stalls, chancel-rails, and gas-standards.

## AUCTION SUMMARY.

For the Week ending January 31.

TUESDAY, 27th:—

Mr. G. B. Smallpeice.—Freehold Building Land, Leytonstone.

THURSDAY, 29th:—

Messrs. Kidwell & Son.—Old Ship's Timber, Royal Dockyard, Chatham.

## COMPETITIONS OPEN.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY,

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "N stor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the india-rubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMER'S SQUARE, N.W.

WARRINGTON.—Jan. 26.—For Cast and Wrought Ironwork in Extensions of Iron Roof of Market, and for Building Inspector's Office. Mr. T. Longdin, Borough Surveyor, Town Hall, Warrington.

WIDNES.—Jan. 28.—For Supplying a 10-Ton Steam Roller. Mr. James T. Allen, Clerk to the Local Board, Public Offices, Widnes.

\* \* See last week's issue of "The Architect" for a large number of Contracts still open.

## TENDERS.

## BALLINASLOE.

## SALES BY AUCTION.

FOY, MORGAN & CO. beg to announce that their Next PUBLIC AUCTION will take place on

WEDNESDAY, FEBRUARY 4, 1885,

at the BALTIMO SALE-ROOM, Threadneedle Street, E.C., when they will offer their usual assortment of DEALS, BATTENS, BOARDS, TIMBER, &c.

Catalogues will be issued in due time.

FOY, MORGAN & CO. {Wood Brokers, 108 Bishopsgate Street Within, E.C.

Leytonstone, close to the Station on the Great Eastern Railway.

MR. GEORGE B. SMALLPEICE has received instructions to SELL by AUCTION, at the Mart, Tokenhouse Yard, Bank, England, on Thursday, January 29, at Two precisely, FIFTEEN PLOTS of FREEHOLD BUILDING LAND, situate in the Fairlop, Fillebrook, and Bulwer Roads, with frontage amounting to 550 feet. Also the Freehold Residence in Fairlop Road, known as Albany Villa. The land is exceedingly well placed, within 20 minutes' ride of the Metropolis, to which there is a constant and regular service of trains; it is well adapted for the erection of villas of a superior description, and which, from their easy access, would readily command a desirable class of tenants. The residence may be obtained of C. B. Cooper, Esq., Solicitor, 40 Bedford Row, W.C.; at the Mart; and of George B. Smallpeice, Surveyor and Auctioneer, 9 and 10 Tokenhouse Yard, Littlebury, E.C.; and Guildford.

## VAUXHALL.

On the Albert Embankment, in close proximity to the river. A Freehold Building Site of about 12,500 square feet, with extensive frontages to the road and pathway of the Embankment, close to Messrs. Doulton's Potteries and other large factories, eminently suitable for the erection of a warehouse, Public Hall, or business premises requiring space and a prominent and commanding position unequalled in the district.

MESSRS. FAREBROTHER, ELLIS, CLARK & Co. are instructed to offer for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Thursday, February 12, 1885, at 2 o'clock, the above valuable FREEHOLD BUILDING SITE.

For particulars apply to H. E. Brown, Esq., Solicitor, 22 Great George Street, Westminster, S.W.; or to Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, and 18 Old Broad Street, E.C.

## BEXHILL-ON-SEA.

Between St. Leonard's and Eastbourne, with Railway Station on the Estate.

MESSRS. E. & H. LUMLEY beg to announce that the extensive improvement works which have been carried on at a cost of about £50,000 are now complete, and invite the attention of builders, contractors, and capitalists to the valuable sea frontage now ripe for buildings. Leases will be granted on easy terms, and every facility afforded for developing this very promising seaside town.

Plans and particulars may be obtained of Lumleys, agents to the freeholder, the Right Hon. Earl DE LA WARR, at 21 St. James's Street, Piccadilly, S.W.

## CROWTHORNE, BERKS, and BLACKWATER, HANTS.

H. J. E. BRAKE will SELL by AUCTION, at the Royal Swan Hotel, Blackwater, Hants, on Monday, February 9, 1885, at Four for Five o'clock in the afternoon, about 80 acres of valuable FREEHOLD LAND at Crowthorne, Berks (a portion of which is covered with thriving Fir Plantation), in plots from a quarter of an acre to 12 acres each, and a few choice plots with frontages to the main road suitable for shops; also three valuable Building Plots adjoining the Royal Swan Hotel, Blackwater. May be paid for by instalments.

Plans, particulars, and conditions of the Auctioneers, Farnborough, Hants.

## BEDFORD.

For Construction of Service Reservoir, Filter Beds, and Storage Tank, Bedford, for the Corporation of the Borough of Bedford. Mr. JOHN LUND, Engineer. Quantities by the Engineer.

## Entire Works.

## IMPORTANT CHANGE OF NAME.

THE Name of the Celebrated Qualities of HONE STONE produced from the Water of Ayr Stone Quarry and Hone Works, and esteemed and known in the market as "Water of Ayr Stone," "Snake Stone," and "Scotch Hone," and exclusively supplied by me and my predecessors for about one hundred years past, is now changed to the distinctive name "Tam o' Shanter" Hone or Stone, and some of the grades of quality suited for special purposes will be known as "Dalmore Hone," "Montgomeriestone Hone," and "Soutar Johnny Hone."

Every Stone will bear a Label or Stamp with one or other of these Names, and the Public are earnestly requested to ask for it accordingly, as only the very inferior sorts, and those hitherto rejected at my Quarry, will now be sent out by me as "Water of Ayr Stone" or "Snake Stone."

JOHN G. MONTGOMERIE.

Water of Ayr Stone Quarry & Hone Works, Dalmore, Stair, Ayrshire; July 1884.

Peremptory Sale, at Nominal Upset Prices. By Order of the Trustee of the late Mr. F. R. Stephens, Enfield Highway.—A Detached Residence and 16 Plots of Freehold Building Land.

MESSRS. REYNOLDS & EASON will SELL by AUCTION, at the Mart, Tokenhouse Yard, on Tuesday, February 24, 1885, at One for Two o'clock, 16 Plots of FREEHOLD LAND, in a good position for the erection of Shops, and a detached Private House, the first portion of the Prospect House Estate, fronting the high road from London to Hertford, between the Bell Inn and the bridge near the Ordnance Factory Station.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

*TESTIMONIALS.*

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

"Yours, &c.

"To Mr. Grundy." "JAMES WEIR, F.R.I.B.A.

"Baptist Chapel, Clapham; 7, Merton, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.

## ARCHITECTS, BUILDERS, AND CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## PATENT WROUGHT STEEL NAILS. OVAL WIRE NAILS.

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

- Receives and disconnects one Rain-water Pipe and Three Waste Pipes.
- Avoids all Splashing.
- Ventilates the Pipes and Trap.
- Forms Drain for Area or Surface.
- Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT WORKS, 8/6 EACH.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

BELLMAN & IVEY, 95 Wigmore St., London, W.

ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustration which has appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

The Bard.

FACSIMILE OF CARTOON BY PROFESSOR MAILLART.

Size, Thirty-six Inches by Twenty-two Inches.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

May be obtained from all Newsagents or Booksellers, or from the

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

## ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

## SHAKSPERIAN DECORATIVE PANELS.

BY H. STACY MARKS, R.A. (Printed in Colours.)

1. Scene from "The Tempest."
2. Scene from "Midsummer Night's Dream."

3. Petruchio and the Tailor.
4. Falstaff in the Buck Basket.
5. Touchstone, Audrey, and William.

6. Falstaff acting the King.
7. Parolles' Eyes Unbound.
8. Malvolio in the Garden.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence each; or the set of Eight, Five Shillings; by post, Five Shillings and Sixpence.

## The Banquet.

The well-known and beautiful Chromo-lithograph by H. STACY MARKS, R.A.

Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

THE FOLLOWING

## PANELS FROM THE CELEBRATED FRIEZE BY JULES DIDIER

ARE STILL ON SALE, viz.:—

HORTICULTURE . . . Size 34 Inches by 14 Inches.

POTTERY . . . . . Size 19 " 14 "

CONSTRUCTION . . . Size 19 " 14 "

CARPENTRY . . . . . Size 19 Inches by 14 Inches.

METALLURGY . . . Size 19 " 14 "

The Illustrations are reproduced in Colours, by permission of the FRENCH GOVERNMENT.

Price One Shilling each; free by post, carefully packed inside patent roller, One Shilling and Twopence each.

## The Bard.

FACSIMILE OF CARTOON BY PROFESSOR MAILLART.

Size, Thirty-six Inches by Twenty-two Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

## "THE NILE FAIRIES," AND "THE FAIRIES' GODDAUGHTER."

UNIQUE DECORATIVE PANELS BY M. MAZEROLLE.

Size, Twenty-one Inches by Fifteen Inches. Price One Shilling each; by post, carefully packed inside patent roller, 1s. 3d. each.

## The History of Art.

In Two Plates, reproduced from the Splendid Painting around Cupola, in Place St.-George's, Paris.

BY M. FRANCOIS EHRMANN.

Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches. Price One Shilling each; by post, carefully packed inside patent roller, 1s. 3d. each.

## THE TRIUMPH OF JULIUS CÆSAR.

BY ANDREA MANTEGNA.

From the Cartoons in Hampton Court Palace.

Each Forty-two Inches by Fifteen Inches. Price the Set of Two, Two Shillings; free by post, carefully packed inside patent roller, Two Shillings and Threepence.

## The Martyrdom of St. Stephen.

BY E. J. POYNTER, R.A.

Awarded the GOLD MEDAL at the International Health Exhibition.

Size, Forty Inches by Fifteen Inches. Price One Shilling; by post, carefully packed inside patent roller, One Shilling and Threepence.

## THE CLEMENCY OF SCIPIO.

BY GIULIO ROMANO.

From the Painting in the National Gallery.

Size, Thirty-two Inches by Fourteen Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

## Harmony Welcoming the Nations.

The Celebrated Decorative Painting from the Trocadero Palace, Paris.

Size, Thirty-six Inches by Fourteen Inches. Price Sixpence; free by post, carefully packed inside patent roller, Ninepence.

May be obtained from all Newsagents or Booksellers, or from the

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

Printed by SPOTTISWOODE & CO., at No. 5 New-street Square, E.C., and Published by the Proprietors, GILBERT WOOD & CO., at the Office, No. 175 Strand, W.C., London.  
Saturday, January 24, 1885

# The Architect.

## THE WEEK.

THE English language does not contain words which will give adequate expression to the disgust that is felt against the wretches who are attempting to destroy the public buildings of the country. The madman, who in his vanity set fire to the ancient temple, was an estimable character if compared with the cowards who, while causing destruction to others, keep themselves in safety. The political reasons which are involved in the outrages are beyond consideration here; but it is ridiculous for anyone with common sense to suppose that the destruction of a hundred historic buildings would have the least influence in hastening Irish independence. The South Kensington Museum is said to be threatened, but what Parliament would be cowed by the destruction of pottery and trinkets? There is such a mixture of mischief, stupidity, and malice in these experiments that the perpetrators become almost degraded to the level of gorillas. Under the new conditions no building is safe, and the latest proposal which the Americans allow to be concocted is to start a general conflagration of London, by means of fifty Irish agents, who are to begin by setting fire to the houses in which they lodge. Against a band of desperadoes, with abundance of dynamite, scientific construction is of little use. It is therefore incumbent on the authorities, by increased watchfulness, to guard against dangers. It is also requisite that the punishments for the crime should be very different from what are now inflicted. The criminals are exalted when they are treated as State prisoners, and there might be a salutary change if no difference were made between dynamiters and garotters. A liberal application of the "cat" would dispel a good many romantic illusions among the Celts.

THE Irish politicians who are so guarded against uttering a syllable against the outrages would do well to consider the effect a repetition of last Saturday's experiment might have on the condition of their countrymen in England. There is probably a larger proportion of Irishmen connected with the English building trades than is to be found in any other form of industry. The surveyor who has charge of the fabric of the Houses of Parliament (and whose life was nearly sacrificed on Saturday) is an Irishman, and it may be assumed that many of his countrymen are now employed in removing the *débris*. The same state of things is found throughout the country. Irish overseers and Irish labourers of all classes are trusted, and prove themselves to be worthy of trust. But it would not be difficult to excite a panic by which Irish workmen would henceforth be kept away from buildings. There is no doubt that discontent prevails, and the apparent indifference of the Irish in England is not likely to create confidence at the present juncture.

M. ALPHAUD has presented a report in which he estimates the cost of the buildings and other works for the international exhibition which is to be held in 1889 at fifty-six millions of francs. It is proposed to erect two large and permanent buildings on the Champ-de-Mars, each having an area of 34,000 square mètres. One will be approached by the Avenue la Bourdonnaye, and will be devoted to arts; the second, near the Avenue Suffren, to the sciences. They will be connected by a gallery. The palaces will communicate with the temporary buildings of the exhibition, which are to cover 225,000 mètres. There will be a central avenue of 60 mètres width. As yet no arrangement has been made about the plans for the buildings.

Of all men a clergyman should be the most cautious in making charges against his neighbour, although he may belong to the maligned profession of architects. The Rev. R. Moss, D.D., Blackburn, did not remember this maxim. Having been disappointed in a building speculation, he consoled himself by allegations against Mr. AZAHEL

P. BELL, his architect, and then endeavoured to evade the consequences of his ill-temper by defences which have been described as unseemly. Mr. Moss is the owner of a few acres of ground in Bowdon, which he resolved to lay out in plots for building. Mr. BELL was asked to lay out the estate, and the remuneration was to be equal to the first half-year's chief rents. It is not unusual for owners of an estate to set an example by building a house or two. Mr. Moss, it appears, proposed to build three. The tenders were 885*l.*, 1,160*l.*, and 1,924*l.* The two which were cheapest were completed in October 1883; the building of the third was postponed. Mr. BELL's commission at 5 per cent. for the two houses and 2½ per cent. on the third amounted to 219*l.* 18*s.* 7*d.*, out of which 62*l.* had been paid while the works were in progress. Mr. Moss was dissatisfied, apparently without reason. He may have heard it insinuated, as clients do very often, that architects are in the habit of taking commissions from tradesmen, and that Mr. BELL was like his fellows. Mr. Moss gave expression to the allegations, and confirmed them by taking from Mr. BELL the laying out of the estate. As if to show his leniency, he said he could make graver charges. The case had to go before the Courts, and was heard in Manchester on Wednesday, when, of course, Mr. BELL won his fees. But does not action for libel also lie against the clergyman?

THE Paris Municipality have resolved to carry out works on a large scale. On Wednesday there was a vote of 963,000 frs. towards the cost of the new water supply, which is expected to cost eighty millions of francs. The proposed alterations in the city seem like a revival of the HAUSSMAN régime. They are estimated at six hundred millions of francs, but the outlay will eventually be far higher. Two large streets are to be constructed on the south side leading to the Place Saint-Germain des Prés, and the Boulevard Haussman is to be at last extended to meet the Boulevard Montmartre. There will be other improvements. With so large an expenditure the danger arising from so many unemployed men will be abated.

THE authorities at South Kensington were lately compelled to call the attention of the Glasgow Corporation to the risks which were incurred by sending objects for exhibition to the art galleries of the City. The galleries form part of a block of buildings containing shops—one belonging to a baker. It is not surprising there have been fires lately on the premises. A committee of the Corporation have been considering the subject, and they have proposed a partial reconstruction of the galleries. The three M'LELLAN halls are to be retained, but the roofs are to be altered to allow of better lighting and ventilation. Hot-water pipes are also to be introduced. The ground-floor is to be altered. The tenants are to be removed at the earliest opportunity, but the front buildings and shops are considered to be unadaptable for gallery purposes. It is to be regretted that no attempt will be made to give an architectural front to the exterior. "The elevation," says the report, "is a matter of secondary importance. The site is on the line of a public street, and no extra frontage is available to give atmosphere and individuality to the erection. Elaborate architectural effect would be thrown away on the situation; but, even were the site suitable for architectural display, we are of opinion the large expenditure on the structure is undesirable." We are compelled to differ with the committee. An effective front to the galleries is desirable. The buildings are rather monotonous, and the Institute Gallery, which is near, suggests what can be done with a limited frontage.

THE space that is available for students in the Ecole des Beaux-Arts, Paris, is cramped. The French Government have determined to purchase the adjoining Hôtel de Chemay, with its gardens and other premises, in order to enlarge the schools. The property will cost over four millions of francs, and the alterations will add half a million to the amount. But the additions will enable the students to work with more satisfaction to themselves, and the galleries for exhibitions will no longer need to be used for *ateliers*.

## GAINSBOROUGH AS A PORTRAIT PAINTER.

IF it be true that a painting in a mysterious way reveals the mood of the artist when he was at work upon it, then there ought to be a vast amount of delight for every spectator in the Grosvenor Gallery at the present time. GAINSBOROUGH never attempted anything beyond his powers. He appeared to work *con amore*, and there is much the same kind of pleasure in looking at his pictures which is found in reading the novels of JANE AUSTEN or the letters of Madame DE SÉVIGNÉ. Everything shows that within the limits he prescribed for himself, GAINSBOROUGH was a master, and we have none of those ambitious failures which are found even among the works of such a man as HOGARTH. We find so much frankness, freedom, and pleasure about the majority of the two hundred pictures in the Grosvenor Gallery, that the visitor is liable to forget what a vast amount of honest hard work, as well as of genius, the collection represents.

Credit must be given for the pains which have been taken in the selection. But we should have liked to have seen more of the works which reveal GAINSBOROUGH'S manner of working. The unfinished portrait of PERDITA ROBINSON, which was exhibited in 1876, is one of these examples. REYNOLDS says that GAINSBOROUGH used to form all the parts of his picture together, the whole going on, as it were, at the same time. A glimpse of this procedure is to be had in the portrait of the third Earl STANHOPE, and one or two others in the gallery which are unfinished, but none of them suggests it so completely as the sketch we have mentioned, which, in addition to the figure, contains a background that when completed would probably have been as elaborate as the view that is seen in the picture of THOMAS SANDBY and his wife. With the one exception, the Grosvenor collection is sufficiently comprehensive to enable a student to study GAINSBOROUGH with profit to himself.

The first question to be determined in considering a portrait-painter's works is the relation between him and his subjects. At the present time there are plenty of people who would say that in its most perfect condition it approaches a photographer's lens, and that if only clever colourists could be induced to paint up something or other which the lens had produced, then there would be a speaking likeness. Between the attempts which have been made by men of every age to make their canvases as faithful as mirrors up to the analytic power that is seen in some of TITIAN'S portraits, and which only the subject himself may have fully understood, there are many varieties. Every artist who knows his business exemplifies a good many of the attempts, and varies his work according to the opinion which he may have of the man or woman before him, or according to the mood he may be in. REYNOLDS was a conscientious painter; but when his works are brought together it is plain that occasionally he painted portraits in a perfunctory way. There is not much of mechanic exercise in the Grosvenor Gallery. GAINSBOROUGH was a good fellow at heart, and his enjoyable spirit soon discovered anything that was to be liked in the men and women of all ranks with whom he came in contact. He was a humorist that was akin to ADDISON and GOLDSMITH, and it is no exaggeration to say that in his best work there is a touch of the kindly satire of the *Spectator*.

Take, for example, the portrait of TENDUCCI, the singer. The vanity of the coxcomb, with his painted face and pencilled eyebrows, his padded coat and affectation of amiability, are put on canvas in a manner that would be impossible unless the artist had thoroughly enjoyed every trait as a curiosity. Very different is the vanity of Mr. VESTRIS, the dancing-master, who has eighteenth-century deportment written in every line of his face. We are permitted to gaze on a professor of high art, who would be competent to instruct princesses in decorum, teach fine gentlemen how to open a snuff-box with grace, and, with a qualified pupil, expound the conduct of a clouded cane in fifty lessons. The superfine air of the foreign performer is likewise seen in the position of the fingers in the portrait of GIARDINI the fiddler, a man who must have been admired by the painter. The full-length of PARSON TATE would in any other hands be a failure. It is not a fencing-master but a duellist that is before us, and

one who has no misgivings of the certainty of his eye and arm. He bends the cane as if it were a rapier, and looks as if he were making an exact calculation of how many inches the best spot to pink his man was distant from a particular button. This wonderful clergyman, who could box like a prize-fighter, write plays, put down insurrections, and reclaim land from the sea, naturally found his way to GAINSBOROUGH'S studio, and must have been thoroughly appreciated there. Even more humour is seen in the figure of that good young man with the chubby face, Lord FOLKESTONE. He wears the entire of his peer's robes, including a wig and colossal tassels, crosses his legs in an uncomfortable fashion from a sense of duty, holds a big scroll with a plan of the Society of Arts accurately delineated thereon, and does his best to look grave. Fate often puts round men into square holes, but there never was a more remarkable example of her caprice than in placing a peer like his lordship at the head of a learned society. If GAINSBOROUGH could suffer regret, it must have been from the inability to paint more ample robes or introduce more of the old-fashioned Hudsonian conventionalism, or what would be better still, make a cherub out of my lord's round head, with a pair of wings attached. The difference in treatment between this work and the delightful picture *Thomas Sandby, R.A., and his Wife*, which is almost like a copy of a group in Dresden china, is very remarkable. GAINSBOROUGH was not a reading man, and he must have been amused with the notion of the Deputy Ranger of the Great Park, in his scarlet uniform, declaiming from a romance for the gratification of Mrs. SANDBY.

It is in his treatment of the portraits of ladies that the gentle humour of GAINSBOROUGH is most apparent. He knew how much value was placed on dress by women, and he depicted the fashions of that time in a manner that was very different to REYNOLDS'. The portraits of his daughters might serve to illustrate the description of OLIVIA and SOPHIA PRIMROSE in "The Vicar of Wakefield." MARY GAINSBOROUGH, we may be sure, believed, like her mother, that she was a descendant of a long line of princes, and gazed on the world—as now from canvas—with the air of a superior person. Destiny could allot her no more exalted husband than a professional oboe player. The fine bust of Mrs. FITZHERBERT almost corresponds with what is said of the Widow WADMAN in "Tristram Shandy." The skill with which the shapely arm and hand are made an index to the bright eyes could hardly have been derived from a painter's invention, and must have been one of those habits which gave fascination to the lady. The portrait of the Duchess of DEVONSHIRE of which there is a capital monochrome sketch in the Grosvenor Gallery, is also characteristic. REYNOLDS would not have ventured to express so much energy and buxomness in a figure which is a JUNO from head to foot, although he could have expressed equally well the character of the face. Power of another kind is expressed in the portrait of the Spoiled Child, called the Hon. Mrs. GRAHAM, which is worth a journey to Edinburgh to see. It is not impossible that in the rendering of the manifold traits which constitute femininity GAINSBOROUGH'S insight was not the same as the vision of the majority of people. His *Duchess of Devonshire*, *Hon. Mrs. Graham* (in the Edinburgh Gallery), *Mary Gainsborough*, *Mrs. Siddons*, may not have been recognised by the acquaintances of those ladies. REYNOLDS has hinted this when speaking of GAINSBOROUGH'S manner. He says:—"It must be acknowledged there is one evil attending this mode—that if the portrait were seen previous to any knowledge of the original, different persons would form different ideas, and all would be disappointed at not finding the original correspond with their own conceptions." It is no longer possible to verify GAINSBOROUGH'S portraits, but every one knows that when he and REYNOLDS represent the same subject their works rarely coincide in appearance or expression. When GAINSBOROUGH paints two portraits of the same person, there is also a good deal of difference between them. There are numerous portraits in which not the least trace of GAINSBOROUGH'S humouristic spirit is to be found, although there were opportunities for its display. The old granddaughter of the great Duke of MARLBOROUGH, with her juvenile bonnet, was a subject for a little sly satire. The artist has apparently endeavoured to be simply truthful, and it would have been better, perhaps, if he had softened

the bitter mouth and made the face show some sign of a woman's gentleness. GAINSBOROUGH evidently thought that eighteenth-century babies in skull caps were strange objects, as we may judge by the portrait of the future Lady SAY and SELE, and the Puritanic little girls who wear the dresses of charity children can hardly fail to excite a smile; but the pride of the mothers who accompany them is always painted in a way that, for GAINSBOROUGH, might be called reverential.

However much we may admire GAINSBOROUGH, it must be acknowledged that there were subjects with which REYNOLDS succeeded far better. GAINSBOROUGH could hardly have produced the portrait of Lord HEATHFIELD, which is the most characteristic representation in existence of that bull-dog tenacity which has enabled England to hold its own against the world. The *Viscount Hood, K.C.B.*, in the Grosvenor Gallery, does not correspond with our ideas of the sea captain who was in the van of the fight between RODNEY and DE GRASSE. GAINSBOROUGH is not the painter of heroes and warriors; nor are civilians who were remarkable for power at their best on his canvases. His *Dr. Johnson* is a kindly old gentleman, with very dim, gentle blue eyes. He is not the sage to whom the Literary Club looked up with reverence, the dictator whose bow-wow manner scared many aspirants. His *Lord-Chancellor Camden* is the country gentleman rather than the statesman who was supposed to be equal to the composition of JUNIUS's Letters. Whether he was ill at ease with one class of men is not clear, and he may have been awed by HOOD's grim looks and CAMDEN's coldness. It is also very remarkable that the portraits of little girls by GAINSBOROUGH are far less interesting than REYNOLDS'. The Grosvenor Gallery has nothing which suggests the fascination of the *Penelope Boothby*. On the other hand, among REYNOLDS' boys there is not one that will compete with the *Blue Boy*, or the portrait of GEORGE CANNING after he left Eton. They have the advantage of fancy dress, and are masquerading, as it were; but genuine boyishness, of the English and somewhat mischievous kind, is seen in the *John Plumpin* and in the head of the Barton Grange colour-grinder. They are preferable to the *Samuels* of REYNOLDS, although both have probably stolen a good many apples and despoiled many birds'-nests. Why did not GAINSBOROUGH instead of REYNOLDS paint PUCK on a toadstool? The peasant children which are seen in GAINSBOROUGH's landscapes are far more racy of the soil than those of his rival, and indeed the President seems to have had as little love as Dr. JOHNSON for natural scenery.

We have not space to offer many remarks on GAINSBOROUGH's landscapes. But it may be mentioned that the Grosvenor Gallery contains the *Going to Market* (which has never undergone the restorer's operations), two copies of *The Cottage Door*, *The Harvest Waggon*, and sundry other works. They are all very beautiful, and the colours have stood well; but it must be said that GAINSBOROUGH was unable to emancipate himself from conventional treatment, which held sway in those days. The jagged and broken trunks of trees which figure in so many of his foregrounds are examples of that kind of tribute which a painter has to pay to fashion against his own good judgment. GAINSBOROUGH was a keen observer, and when walking with a friend was continually offering remarks on the transient phenomena of nature. He was therefore able to paint country scenes from memory, or with the aid of the broken stones, dried herbs, and pieces of looking-glass of which he made a kind of grotto in his painting-room. The peasant children which are introduced so happily in those scenes were also examples of the transforming power of his pencil. The originals might almost be called cockneys, for Sir MARTIN SHEE relates that they were taken from the family of a cottager in the neighbourhood of London.

#### A SPANISH SALE.

THE South Kensington Museum possesses many splendid examples of the art work of Spain, and among them are several of the jewels and personal ornaments which formed part of the offerings in the sanctuary of the Virgen del Pilar, at Saragossa. The bequest of the invaluable collections of M. le Baron DAVILLIER to the

Museums of the Louvre and Sevres recalls the circumstances under which the English museum failed to secure the most precious object in that sanctuary. The story should be memorable in the annals of the auction-room.

The city of Saragossa contains two cathedrals, of which the richest is known by the title of Nuestra Senora del Pilar. It is a medley of styles, but becomes impressive from the dim religious light. It derives its name from possessing a figure of the *Virgin* carved in wood, that stands on an elaborate pillar in a small chapel, thus marking the legend of a descent from Heaven in the year 40 A.D. The original temple which was so honoured was, according to the popular belief, constructed by St. JAMES the Apostle, the patron saint of Spain. In spite of its sanctity, the building was allowed to fall into a dangerous condition, and people were afraid to worship in it, as the columns and vaulting seemed to be likely to tumble on their heads. There was a decrease in the number of pilgrims, and consequently in the revenue of the clergy. The cost of reparation after so many years of neglect was found to be enormous, and there seemed, at first, to be no way to raise the money. The Spanish Government was appealed to for aid, but the national exchequer was, as is customary, in a state of deficit. Only one resource seemed feasible, and that was the collection of treasures which had been accumulated during many centuries. Although the French in 1809 had been exacting in their demands, there still remained many valuable reliquaries in crystal, chaplets of pearls, pectoral crosses set with precious stones, votive offerings representing heads, eyes, legs, and arms in gold and massive silver, the tributes which had been offered by the faith, the gratitude, and the devotion of Spanish pilgrims from time to time. The state of the building inspired its guardians for once with a sense of the necessity of promptitude; accordingly arrangements were made for an auction, catalogues of the collection were printed in Spanish and French, and forwarded to all the principal museums in Europe.

It so happened that the Baron DAVILLIER was at the time rusticating in Spain, and a friend apprised him of the forthcoming sale. The treasures of the Capilla Mayor were no strangers to him. He had often contemplated them with feelings of admiration and longing, and every object, from the sixteenth-century custodia to the golden statuette of a bull which had been given by the torero CUCHARÈS, was familiar to his mind. But what was most coveted by him was a famous casket in the form of a pomegranate, which when opened displayed exquisite carvings of the *Visitation* and *Annunciation*. This unique work was the most precious thing in the collection, and many a time visions of it appeared to M. DAVILLIER in his sleep. Need it be said that he appeared in Saragossa on the day appointed for the auction, and that he dispensed with the services of an agent?

The sale took place in a sort of chapter-house behind the cathedral, which was large enough to hold a couple of thousand people. At first the jewels were put up. The room was illumined with rubies, emeralds, Oriental topazes, hearts of sapphires, ear-pendants of brilliants, cameos formed in chalcedony, collars enriched with diamonds, decorations of Spanish Orders, amethyst pins, diamond bracelets, which once upon a time had been the tokens of Spanish magnificence, and of which a part may have formed the ornaments of Moorish princes or aids to Spanish beauty. In spite of the distance and discomfort of Saragossa, buyers were attracted and good prices were obtained. One small cross set with diamonds, which was a king's gift to the sanctuary, realised over three thousand pounds. South Kensington was able to obtain specimens of the jewellery, and especially of seventeenth-century work.

Everything in Spain is attended with deliberation, but even the stately slowness comes to an end in time. The Baron DAVILLIER, with all his experience of auction-rooms, was on the tenter-hooks. At last it was the turn for the pomegranate lot. The appearance of the casket excited the most intense interest, for it was supposed to be a national talisman, and the crown surrounding it was accepted as a symbol of royalty. Every foreign connoisseur was charmed with the colour of the enamel, the fine form of the casket, and its dainty workmanship. When it was opened, the red grains or seeds were found to be sparkling rubies. Accord-

ing to tradition it had been made by **BENVENUTO CELLINI**, and it was not unworthy of his hands. Before the auction a good diplomatist might possibly have secured the gem at a low price, for a local expert had valued it at no more than 200*l*. The biddings were taken with the customary tardiness, and to the Baron it seemed an age before the real contest for the prize was allowed to begin.

The Science and Art Department had deputed **Mr. WILLIAM CHAFFERS** to be its representative, and it was felt by **M. DAVILLIER** that in him his doughtiest opponent was to be found. It was therefore necessary to be careful in his tactics. But if we believe **M. ENDEL**, from whose little book much of our information has been derived, the English expert is not a linguist, and he could only make himself understood or be able to comprehend the situation by the aid of his rival. **M. DAVILLIER** accordingly found himself in the odd position of alternately bidding for and against himself, and the sale must have had a piquancy beyond the ordinary excitement of a sale-room. The people of Saragossa had never before witnessed opposition conducted on so romantic a principle, and it was felt that credit was alike due to the Briton for his confidence in his rival's honour, and to the French Baron for the courtesy by which he made his own position more difficult and infinitely more costly.

The speeches of the auctioneer delayed the biddings, but at last 2,000*l*. was reached. That was the limit fixed by the Science and Art Department, and **Mr. CHAFFERS** was compelled, with due recognition of his rival's worth, to give up the contest at the moment when it became most exciting. **M. DAVILLIER** was master of the field, and all eyes were turned to him. Instinctively he put his hand on the treasure for which he had so long yearned and fought so bravely. The auctioneer raised his bell, and amidst general silence began to utter the universal formula. "Once," "twice," were heard; the final word was on his lips when a man wearing a mask pushed his way into the room, and in a sonorous tone cried out, "A hundred reals more." Everyone turned to have a look at the mysterious bidder who had arrived so providentially, and possibly to some minds it may have seemed as if Heaven had at last interposed for the purpose of preserving the treasure for Saragossa. The effect produced on the Baron by the appearance of the new-comer was to make him resolve to bid no more. Wherever he came from, the man's entry appeared to be too melodramatic for the occasion, and unworthy to be associated with the disposal of the casket. The auctioneer expended the finest words in his vocabulary in appealing to the pride of Baron **DAVILLIER**, who was supposed to be the envoy of the French Government, but in vain. He urged that a champion who had overcome England and all its power should not in justice to himself succumb when he heard the voice of an unknown combatant. **M. DAVILLIER** was proof against all the eloquence of the rostrum. In the calmest voice he addressed the crowd somewhat in this way:—"Senor President and people of Saragossa,—You came here to witness a chivalrous struggle between England and France. You saw what followed. I imagine that the champion who has just entered is a chevalier of Saragossa. I believe that it is my duty to retire from the lists. I trust that the prize which you have kept for so long a time in your cathedral may remain there for many centuries, to recall the great events of your history. I renounce the happiness of possessing so marvellous a work." A speech conceived in so high a spirit of romance overcame the gravity of the Spaniards, and the Baron could hardly have won more plaudits if he had been a successful bull-fighter. There were cries of "Bien! Bien! Senor Estrangero!" and it was found necessary to adjourn the sale until the excitement had subsided. The fate of the casket was not yet decided.

The Chapter of the cathedral were far from being satisfied with so much enthusiasm. The chance of obtaining a large sum of money was gone, for whether the appearance of the masked stranger was a ruse to induce higher bidding, or was an effort on the part of enthusiasts to preserve the casket, the result was the same, and there was no addition to the restoration funds. The auctioneer was accordingly instructed to endeavour to persuade the Baron, and when the auction was resumed there was much talking before he pronounced the final word. But Baron **DAVILLIER** was

immovable, and when the bell sounded there was a fresh outburst of applause on finding that the casket was not to be taken among strangers.

The magnanimity of the Baron had, however, its reward. Ten years afterwards, a stranger who had the famous pomegranate under his cloak called on Baron **DAVILLIER** in Paris. A sale was accomplished, and now the famous casket, like the other works in his collection, belongs to the French people. The care that was exercised by the Baron in his selections might be inferred from the fifty Spanish works which he lent for the special exhibition in 1881 at South Kensington.

#### SIR F. LEIGHTON, P.R.A., ON ART STUDY.

THE annual meeting of the Canterbury School of Art was held on Thursday, the 22nd inst., and it was rendered remarkable by the delivery of an address by the President of the Royal Academy, who has hitherto held himself aloof from the schools of the Science and Art Department. The following is the address delivered on the occasion:—

Students of the School of Canterbury,—There are compulsions to which the most rigid rules must yield, and under such pleasant compulsions I am here to-night. I have been indeed forced, on various valid grounds, of which the most imperative is this, that any other course would be incompatible with the labours of a practical working artist—I have been forced, I say, to make to myself, and have hitherto strictly adhered to, a rule, to confine all prominent participation in functions like those which I am discharging to-night to the precincts of Burlington House. The fact that in obedience to this rule I have been obliged to decline many invitations like yours, makes it necessary for me, in courtesy to others, to say a word in regard to this infraction of my rule, at the risk even of being accused of egotism, and of telling you that which you are not concerned to know. Well, when my old and esteemed friend, **Mr. Sidney Cooper**, appealed to me in kindly urgent terms a short time ago, I felt that a case was before me of an altogether unusual character, one of which I could not, I will not say apprehend, but hope that it might repeat itself very frequently. For who is it that has required my presence to-day? It is a veteran artist, and a much-respected colleague of mine in the Royal Academy, who, having raised himself by his untiring energies and his unaided talents to the position he now occupies, turns, in the mellow evening of prosperous days, affectionately to the city of his birth; and, mindful of his own youth, has, in his generosity, opened up to the youth of this city resources which he did not enjoy, and incentives with which he was not borne up, in the hope that the art to which he is so earnestly devoted may profit, and the dignity of his native town be enhanced. Whether his bright example will be followed by others I cannot say, but that I should pay to it the tribute of respectful recognition, about that I have no doubt. But he has asked me not merely to have the satisfaction of distributing well merited rewards, but also to say a few brief words of sympathy and encouragement to the students of this school. Well, my young friends, let me say this at once. There is no sentiment which words bring straighter from my heart than that which binds me in sympathy to those who, like you, are starting on the way along the arduous path up which I am myself plodding, plodding with a purpose, indeed, in my advanced years, as firm as yours in your spring, but with impaired resources of wind and limb wherewith to approach those summits which are, I fear, scaled only in the dreams of youth. But to this feeling, which embraces all my young fellow-workers wherever their lot may be cast, another is added in the sight of a school rising like this of yours in a provincial centre and city. It is not merely that I rejoice to see art spreading her benign influences far and wide, and casting her seed over the broadest possible area; though, indeed, I cannot conceal from myself that the facilities of training offered to young artists, facilities which have increased in a quite marvellous degree within the last thirty years, carry with them danger as well as a boon—germs of bitter disappointment as well as a harvest of pure joys. I do not conceal from myself that art with her allurements draws within her bondage not only those whom nature has marked for her service, but that in her dazzling fires the wings of many a hope are withered and burnt up, for there is no calling in regard to which it is more needful, none in regard to which it is more difficult to discriminate with certainty between inborn gift and mere inclination. So much so that I doubt whether those in whose hands the guidance of the young rests have not as grave a responsibility in the direction of checking as in that of encouragement. Nevertheless to many, to the majority, the training brought within their reach is a boon, and I rejoice therefore to see that boon widely dispensed. But there is another reason why I am especially glad to see schools rising

in our provincial towns, and it is this: it is that in art, as in other forms of intellectual development in which personal individuality plays a leading part, I believe much in decentralisation. I believe that art has much to gain in variety, and, if I may use the expression, in physiognomy, by the development and assertion, not only of individual temperament, but of the wider distinctive characteristics of the various groups into which our countrymen are divided. Now this may perhaps in the present incompletely developed conditions of the art of England seem to you here a visionary demand, but the energies of schools should be turned towards an ideal future. A little reflection will remind you that the example of the past, and certain signs in the present, justify us in proposing to ourselves this ideal, many-sided national development. If you turn to the history of art in the fifteenth and sixteenth centuries in Italy, the land of its highest development since the fall of Greece, what do you find? You find that (decentralisation being absolute, the country being divided into numerous small states, each independent of the others, and indeed habitually at deadly feud with one or the other, so that the keen edge of their respective individualities was being constantly whetted in fierce antagonisms) each of these states has æsthetic expression in an art wholly personal to itself, thus imparting to the art of the country, viewed collectively, an infinite and most fascinating variety of flavour. This is of course an extreme case. Apart from the wholly exceptional gifts of the race, it is only in a country politically split up that such complete local diversity is possible. Such a combination of gifts and surrounding circumstances is not again to be looked for. Nevertheless, if we look at our own British art in its broadest features, we shall find for instance a marked and unmistakable distinction between the work produced in the two halves of the kingdom, which lie respectively north and south of the Tweed. And why does the art of the Scotch assert its distinctive characteristics within the body of English art? Simply because all sincere art mirrors the temper and mood of the men whose utterances it is. And so the Scotch, having strongly marked national attributes, their art, being sincere, partakes of this strongly characterised personality. In like manner, though not of course in like degree, the various portions of our southern realms, differing, often widely, in features of soil, climate, and race, and filled with local traditions of which they are proud, would, if art were developed to a complete, consenting, harmonious expression, send forth artists marked with a general and distinctive stamp, thus enriching and colouring the artistic life of the whole country. And let me here remind you of an important fact which should wing your courage and sustain you in your flight, namely, that not only have most of our greatest artists come to us from the purer air of the provinces, as, for instance, Reynolds, Gainsborough, and my brother Yorkshireman, Flaxman, but in one branch of art, landscape painting to wit, one county town, Norwich, has attached its name to a school. You have all heard of the Norwich School with its great lights, old Chrome and John Tell Cotman. Think of this, then, youths and maids of Kent, and see that round the feet of your majestic cathedral you plant the seed of a noble school, which shall bear the name of this cradle of Christian England. And what, you will ask, shall you do to raise your grand historic county to the artistic position you covet? I can tell you in answer no more than this: There is one quality without which you never may hope to do so, sincerity. Sincerity; that is the word which I should wish to survive in your memory as the echo and outcome of what you have listened to so kindly this evening. And let me ask you, further, to understand the word in its broadest and highest sense. I do not mean by its literalness in transcription of outward fact, though that, with some natures, will, no doubt, be the form sincerity will take. I mean truthfulness to your own individualities. To no two of those amongst you to whom it is given to be real artists will Nature whisper the same secret. To each, if he be attuned to hear, she has a special message, the possession of which, mark this, constitutes his artistic personality; and I would ask you to impress this truth on your minds, whatever be your gifts, that in proportion to the faithful sincerity with which you, who are privileged to be her interpreters, render that which she has put into your hearts, in that measure and degree will be your right to the artist's name, and your share in the great work of advancing the cause of art in your county, your country, and in the world.

#### GLASGOW INSTITUTE OF FINE ARTS.

THE annual report of the council of the Glasgow Institute states, that in spite of many adverse circumstances, the operations of the year as a whole have resulted favourably. At the close of the financial year on August 31, 1884, the amount of capital stood at 17,843*l.* 16*s.* 11*d.*, being an increase during the year of 485*l.* This increase results from the contributions of new members. During 1884, the Institute held only the

regular annual spring exhibition. The exhibition was one of fully average merit and interest, but bad weather and the dull state of trade told upon both attendance and sales, and the returns of the Institute from these sources was 200*l.* below those of the previous year. The number of works sold at the exhibition was 187, producing 4,583*l.* 18*s.* The revenue account shows a satisfactory improvement. On the year's operations there is a surplus of 58*l.* 18*s.* 5*d.*, arising mainly from decreased expenditure, increase in shop and gallery rents, and a saving in interest resulting from the repayment, mentioned in last year's report, of 2,000*l.* to the trustees of the late Mr. A. B. Stewart. Looking to the example set in other towns, and with a view to increase the public interest in the Institute exhibition, the council set on foot a scheme for establishing an art union in connection with the exhibition. The art union having been licensed by the Board of Trade is now in full operation, and the council recommend it most earnestly to the support of their fellow members. The present state of the membership is 493, of whom forty-eight have been elected since last report.

#### MR. RUSKIN ON MOUNTAIN FORM.

MR. RUSKIN'S introduction to "The Limestone Alps of the Savoy," by Mr. W. H. Collingwood, M.A., contains some very interesting reminiscences and notes. The introduction covers some two dozen pages, and at the outset Mr. Ruskin remarks that his friend's book is the fulfilment of a task which "I set myself many and many a year ago, and had been obliged by the infirmities of age with deep regret to abandon." The subject of the sculpture of mountains, he goes on to state, "the forms of perpetual beauty which they miraculously receive from God was first taken up by me in the fourth volume of 'Modern Painters,' and the elementary principles of it there stated form the most valuable and the least faultful part of the book. They had never been before expressed or even thought of, for the simple reason that no professed geologist could draw a mountain, nor, therefore, see the essential points of its form. So that at this very time being the large model of the valley of the Chamouni exhibited in the library of the British Museum is a disgrace not only to the Museum first and the Geological Society next, but actually it is a libel on the ordinary intelligence of human nature." The only member of the Geological Society who could draw a mountain in outline was, Mr. Ruskin declares, James Forbes, and he could not draw in light and shade; but his outlines were precise and lovely. Mr. Ruskin proceeds:—"After comparing notes with James Forbes at the village inn of the Simplon in 1849, I went up to the Bell Alp, then totally unknown, and drew the panorama of the Alps, from the Fletsch Horn to the Matterhorn, which is now preserved in the Sheffield Museum. Then going up to Zermatt I took the first photograph of the Matterhorn (and, I believe, the first photograph of any Alp whatever) that had then been made. On the work done in Zermatt at that time the mountain section of modern painters was principally based; but in 1861 I went into Savoy and spent two winters on the south slope of the Mont Salève in order to study the secondary ranges of the Alps and their relation to the Jura. I quickly saw that the elements of the question were all gathered in the formation of the mountains round the Lake of Annency, and at Tallories in the spring of 1862 made a series of studies of them, which only showed me how much more study I wanted. Being called to England I left the light blue lake with resolution of swift return, and the time of Troy-siege passed by before I stood again upon its brink among the vineyards." Mr. Ruskin then goes on to explain that in the meantime he had been able to do some useful collateral work. The summer of 1866, though principally given to "Proserpina," yet allowed him time, at Brientz and Interlachen, to trace the lines of Studer's sections across the great lake furrow of central Switzerland. "I learned enough geological German to translate for myself parts of his volumes which relate to the Northern Alps, and wrote them out carefully, with brilliantly-illuminated enlargements of his tiny woodcuts, proposing the immediate presentation of the otherwise somewhat dull book to the British public in this decorated form. A letter bringing me bad news interrupted me one bleak wintry day; and the since-untouched manuscript, with its last drawing only half-coloured, remains on the library shelf behind me like an inoffensive ghost." The study of mountain form was taken up with renewed eagerness on his retirement from his Oxford professorship in 1879, and he acknowledges the assistance he received from Mr. Clifton Ward, whose death in 1881 left him again discouraged and at pause, "in the presence of questions which had become by his help more definite, but in that very distinctness less assailable." Feeling also that his strength would no more permit him to climb the Swiss hills, he resigned the hope of doing more among the precipices of the Buet and Jungfrau, "and began, as better suited to my years, the unadventurous rambles by the streams of Yewdale."

But here again he was soon in need of help. Though still able easily enough to get to the top of Wetherlam and Silverhow, he had no time for the survey of the country in all the lights of evening and morning, as he felt to be necessary for the understanding of its essential features, and he entreated Mr. Collingwood, who had been at work for him on the bed of the retreating Glacier des Bossons, to come to his assistance at Coniston, and make a perfect model of the mountain group within a day's walk of Brantwood. Mr. Collingwood gave a summer to the task, and completed the model, "the best, I am bold to say," Mr. Ruskin remarks, "yet made of any part of the Lake district." The breakdown of Mr. Ruskin's health made a sojourn in Italy desirable, and after recrossing the Alps he asked Mr. Collingwood to review with him, "while the snows were yet high," some of the old problems "in the much-loved recesses of the Dorous and Tournette." Some interesting notes of the character and results of these studies follow, and Mr. Ruskin incidentally remarks that "geologists seem satisfied nowadays that the whole globe is a sort of flying haggis, or lava pudding, out of which, I see by Mr. Ball's lecture on the 'Corridors of Time,' the moon got pinched at the baker's." Mr. Ruskin contributes a reminiscence "of a real live hermit" he found in a cave two thousand feet or so above the valley of the Rhone. This hermit, in his "mossy and cressy retirement," he contrasts with the tormented existence of the modern travelling Eremit, "in caves which he has paid millions of money to dig that he may not see the Alps when he gets to them."

## TESSERÆ.

Vitruvius.

PROFESSOR DONALDSON.

VITRUVIUS is the only ancient writer treating specifically on architecture whose work has been preserved entire to the present period. The value in which he has been held by the moderns has been as various as extraordinary. Upon the revival of ancient literature in Italy, the treatise of our author was in high estimation, merely as a work of the ancients. It was natural, at a time when the literature of the country was in its infancy, to look up to the productions of the Greeks and Romans as models of perfection, having been produced in times when the human mind was more highly cultivated and refined, and endowed with the best fruits of a finished education. But there was another cause which gave him value, and this arose from the revival of ancient art also, which began to supersede the Gothic, Byzantine, Lombard, Tedesco, or whatever other style of architecture it may be called, which was then prevalent in Italy, and from the disorganised mass of Roman antiquities not having then been adequately studied, and consequently being very imperfectly understood. The various combinations which directed the conceptions of ancient genius had therefore not been discovered. When, however, a reference to Vitruvius brought to light the three divisions of species of columns and all that order and method of arrangement which he describes, he became of course the text-book of architects and writers upon architecture, and his dictum was held in absolute respect. This reference was, in subsequent times, rather perhaps the result of a blind respect for established opinion than the fruit of a minute investigation of the author himself, until at length a revulsion in the opinion of some arose; and of late it has been the fashion as much to depreciate his merits as it was formerly the practice to exalt them. This has been as unwise as it is unjust; for, although Vitruvius can by no means be considered as an author devoid of defects, yet it cannot be denied that he contains information connected with our art which exists not in other sources. Alberti, whose eminence as an architect it would be vain to attempt to depreciate, has made his work, "*De re ædificatoriâ*," but an amplification of that of the Roman, borrowing, as has been well shown by Straticò, whole paragraphs from an author which he has but enlarged. Pliny quotes him almost word for word, and it would be useless to attempt to cite the numerous references among moderns which are made to the books of Vitruvius.

### Safe Loads on Iron Columns.

B. B. STONEY.

Navier gives one-fifth of the breaking weight as the safe load in practice. Francis, an American engineer, also gives one-fifth, while Morin adopts one-sixth. My present opinion is that cast-iron pillars supporting loads free from vibration, such as water-tanks, will safely carry one-fifth of their breaking weight. In factories or stores, where moderate vibrations occur, the working load should not exceed one-sixth; and if the pillar be liable to transverse strains, or severe shocks like those on the ground floors of warehouses, where loaded waggons or heavy bales are apt to strike against them, the load should not exceed one-tenth of the breaking weight, or even less in some

cases, where the strength of the pillar depends rather on the transverse strain to which it is liable than the weight it has to support. For instance, the effect of wind on a light open shed supported by pillars may produce a transverse strain which will be very severe in proportion to the weight of the roof. The same thing may occur if heavy rolling goods, such as provision kegs or loaves of sugar, are piled up in such a manner as to cause horizontal pressure like that of a liquid. It is also necessary to take into consideration the foundations on which the pillars rest, for if these yield unequally one pillar may sustain much more than its proper share of load.

### Style in Drawing.

W. BURGESS, A.R.A.

The manner in which a man draws does and must affect the nature of his design more or less. Thus, if he uses strong thick lines, he will, in all probability, be induced to make his design massive and simple, and not give way to the vanities of crockets and pinnacles, because he will find that he has hardly got space to get them in. He likewise sees his design in its most severe and unfavourable aspect, and ten to one the building will turn out much better than the drawing, to the advantage of every one concerned. If, however, the architect draws in a moderately thick line, and puts in the stone joints and etches the walls (I am now speaking of elevations, &c.), he simply deceives not only his client, but, still worse, himself, for the building is almost sure to come out worse than the drawing—the joints, roughnesses, &c., not, of course, showing in new work. As to the third style of drawing, with very fine, hair-like lines, relieved by what is term back-lining, whereby small fillets are made to look like hollows, and hollows like fillets, this style is scarcely worth mentioning, for it means nothing.

### Iron Straps in Carpentry.

[T. YOUNG.

When it is necessary to employ iron straps for strengthening a joint, considerable attention is necessary that we may place them properly. The first thing to be determined is the direction of the strain. We must then resolve this strain into a strain parallel to each piece, and another perpendicular to it. Then the strap which is to be made fast to any of the pieces must be so fixed that it shall resist in the direction parallel to the piece. Frequently this cannot be done, but we must come as near to it as we can. In such cases we must suppose that the assemblage yields a little to the pressures which act on it. We must examine what change of shape a small yielding would produce. We must now see how this would affect the iron strap which we have already supposed attached to the joint in some manner which we thought suitable. This settling will, perhaps, draw the pieces away from it, leaving it loose and unserviceable. This frequently happens to the plates which are put to secure the obtuse angle of butting timbers, when these bolts are at some distance from the angles, especially when these plates are laid on the inside of the angles. Or it may cause it to compress the pieces harder than before, in which case it is answering our intention. But it may be producing cross strains which may break them, or it may be crippling them. The strap which we observe most generally ill-placed is that which connects the foot of the rafter with the beam. It only binds down the rafter, but does not act against its horizontal thrust. It should be placed further back on the beam, with a bolt through it, which will allow it to turn round. It should embrace the rafter almost horizontally near the foot, and should be notched square with the back of the rafter.

### Drying and Burning of Bricks.

H. CHAMBERLAIN.

The drying of bricks is a matter of great importance, and requires more attention than it generally receives. From hand-made bricks we have to evaporate some 25 per cent. of water before it is safe to burn them; thus in works producing 20,000 bricks per day, or 6,000,000 per annum, we have to evaporate more than twenty tons of water every twenty-four hours. The burning of bricks is exposing the dried brick to such a degree of heat as to change its character from that of a merely absorbent lump of dry earth, to a hardened, indestructible, partially vitrified mass, or artificial stone, which will withstand the action of the atmosphere. The effect of fire on clays or brick earth varies with the proportion and number of earths and salts of which they are composed, and the different percentage they bear to one another. Clay or pure alumina is infusible, but on exposure to great heat contracts freely in bulk. It is this property on which the principle of Wedgwood's pyrometer is based. Alumina combined with silica, or alumina combined with lime, will withstand the most intense heat which can be obtained in a furnace; but a mixture of these three earths will melt at a very low heat, the lime acting as a flux on the silica; and, according to Dr. Ure, in his "*Dic-*

tionary of Arts," the more readily the nearer the mixture approaches the following proportions, viz., alumina, one-fifth, lime, one-fifth, and silica, three-fifths; by adding two parts more of sand it becomes one-seventh alumina, one-seventh lime, and five-sevenths silica. The Devonshire and Dorsetshire plastic clays are composed of silica, three-fourths; and alumina, one-fourth. They burn very white, and form the basis of earthenware. According to their composition, therefore, very varied are the degrees of temperature to which bricks must be exposed in burning; thus, those made from London clay about Uxbridge take from 10 degs. to 15 degs. Wedgwood to burn them sufficiently hard. The firebricks of Stourbridge take 85 degs.; the vitrified blue bricks of Staffordshire, 95 degs.; and the vitrified bricks of North Wales require 120 degs. of Wedgwood, or the same heat as an iron smelting furnace. The general colour of burnt bricks is red, owing to the clay containing a little iron; but where the percentage of this substance is larger the colour of the brick is blue, as in Staffordshire, Shropshire, and Worcestershire. For burning bricks we have to employ the utmost care and attention, in exposing them to as high a heat as they can stand without endangering their melting. If they are not sufficiently burnt they will be very absorbent, and will retain sufficient moisture for a frost to destroy them.

#### The Difference between Architecture and Building.

SIR WILLIAM CHAMBERS, R.A.

It is not to be imagined that building, merely considered as heaping stone upon stone, can be of great consequence, or reflect honour either on nations or individuals. Materials in architecture are like words in phraseology, having separately but little power, and they may be so arranged as to excite ridicule, disgust, or even actuate the mind with unbounded sway. An able writer can move even in rustic language, and the masterly dispositions of a skilful artist will dignify the meanest materials, while the weak efforts of the ignorant render the most costly enrichments despicable.

#### The Sculpture of the West Front of Wells Cathedral.

PROFESSOR COCKERELL, R.A.

Regarded in the right spirit, we shall wonder at the inexhaustible resources of the artist in delineating the various and opposite characters of his multifarious composition—in which no two are to be found alike, and in each of which we find the appropriate idea—and the fulness of embodiment which sustains the *dramatis personæ* throughout, with an untiring energy of impersonation in costume, symbol, and action, which excites our warmest admiration. We have the sanctity of the monk, the meekness and abstraction of the supreme pontiff; the archbishop; the pious energy of the bishop in the act of benediction; the prudent abbot; the devoted anchorite; the haughty and imposing king; the stark conqueror fiercely justifying his usurpation; the placid and impassable Confessor administering his good old laws; the lusty, but hapless "Iron-side"; the intrepid Harold, encased in mail; the king, defender of the faith, treading upon the fallen Pagan; the comely, gallant prince and lover; the devout nun; the majestic queen benefactress;—who have retired from the pomps and vanities of the world; the lovely bride of Henry I., "the fair maid of Brabant," the theme of the troubadour; the inspired evangelist, or the malignant sprite; each and all discovering a racy energy of conception, which the informed artist may envy. And though sometimes pushed almost to caricature, the better to explain the person, in keeping with the grossness of that day, these works contain, beyond all doubt, lessons to the artists of our times which ought not to be declined.

#### Sculpture in Marble.

RICHARD WESTMACOTT, R.A.

If the model is to be copied in marble or stone, the first step is to procure a block of the required size. Two stones called "scale stones" are then prepared, upon one of which the model or plaster cast is placed, and upon the other the rough block of marble. The fronts of these stones have figured marks or "scales" exactly corresponding. An instrument, capable of being moved by socket-joints and movable arms, is then applied to the scale-stone of the model, and a projecting point or "needle" is made to touch a particular part of the model itself. This is carefully removed to the scale-stone of the rough block, and the marble is cut away till the "needle" reaches so far into the block as to correspond with the "point" taken on the model. A pencil mark is then made to show that the point is fixed. This process is repeated all over the model and the block till a rough copy or shape of the model is entirely made. These "pointing" machines are not always precisely alike, but the principle upon which they act is exactly similar in all. The statue being thus rudely shaped out, the block is placed in the hands of a superior workman called a carver, who copies the more minute portions of the work by means of chisels, rasps,

and files, the pencil marks showing him the precise situations of the parts, and the limits beyond which he is not to penetrate into the marble. When the carver has carried the work as far as the sculptor desires, he proceeds himself to give it the finishing touches, improving the details of form and expression, producing varieties of texture, and harmonising the whole. The rich quality of surface that appears more or less in works in marble is produced by rubbing with fine sand or pumice-stone and other substances.

#### Flemish Bond a Misnomer.

PROFESSOR HOSKING.

Neat work, in fact, can be produced more easily with "Flemish bond," but "English bond" has the reputation of being the best bond structurally. Why the two arrangements should be distinguished by the names they bear is a matter of uncertainty; at least, it is unknown to the author, who supposed, in common with most other people with whom he has conversed upon the subject, that alternate header and stretcher in the same course was the practice in Flanders, and generally in the neighbouring countries on the Continent, whilst the term "English bond" seemed to imply that the arrangement which bears that designation is peculiar to England. A visit made a few years ago to the country where "Flemish bond" ought most to abound, if the name be properly applied, enabled the author to observe what had never, to his knowledge, been remarked by any person who has published his remarks, and what was quite unknown to every one to whom he has stated since his return what he had observed. At Rotterdam and at the Hague, at Antwerp, at Brussels and at Liege, at Cologne, at Mayence, and at Frankfurt, and again throughout the north-eastern parts of France, brick walls are built according to the arrangement distinguished in England as "English bond," and "Flemish bond" unknown—at least no single example of it fell under the author's observation in any of the towns and countries indicated, although his attention was called to the subject by the quay walls at Rotterdam before he set foot on shore.

#### Construction of Observatories.

AMEROSE POYNTER.

In the construction of buildings devoted to the purpose of astronomical observations, the most important requisite is to provide against the effects of vibration on the apparatus. Any contact with the floor or other portion of the building would not fail to produce, upon the slightest movement, concussions which, multiplied by the magnifying power, would render the telescopes useless. The mode of adapting the building for its peculiar use is by rendering it independent in all its parts of the piers upon which the instruments are fixed. The foundations of the latter are also laid as deep as possible, in order to obviate the effects of vibration from external causes, against which, however, it is not always practicable to guard, the mere tread of a foot-passenger being often sensible to an observer using a powerful telescope at a considerable distance.

#### Ancient Use of Vermilion.

WILLIAM LINTON.

Native cinnabar or vermilion, a sulphuret of mercury, was first prepared by Kallias, the Athenian, five hundred years before the Christian era. There was a minium or cinnabar wrought in Spain from stone mixed with silver sand; also in Colchis, where they disengaged it from the fronts of the high cliffs by shooting arrows at them. Pliny and Vitruvius call it minium, and Dioscorides observes that it was falsely thought by some to be the same as minium. Vermilion is the colour with which the statues of the gods were painted. It was abundant in Caramania, also in Ethiopia, and was held in honour among the Romans. Their heroes rode in triumph with their bodies painted with vermilion, and the faces of the statues of Jupiter were coloured with this pigment on festal days. The monochrome pictures of the ancients were wrought with it. There was also an artificial kind of cinnabar, a shining scarlet sand, from above Ephesus. Vitruvius and Pliny say that vermilion was injured by the light of the sun and moon. To prevent this result the colour was varnished by a mixture of wax and oil. Sir Humphry Davy found vermilion in the Baths of Titus.

#### THE SURVEYORS' INSTITUTION.

AT the preliminary examination which was held of the candidates who presented themselves on the 20th and 21st inst., the following candidates satisfied the examiners, viz., Messrs. Archibald, Beard, Bensley, Brown, Buss, Champion, Chew, Coales, Cokat, Eves, Fitz-Hugh, Goodman, Gough, Green, Harding, Jenkins, Jonas, Jones, Lloyd, Lumley, J. B. Mann, R. B. Mann, Mathews, Newton, Nicholson, Nockolds, Parry, Paterson, Pratt, Rand, Robinson, Selby, Smurthwaite, Varley, Vaughan, Webb, Wilkinson. Mr. Henry Lewin Jenkins passed at the head of the list.

## NOTES AND COMMENTS.

THE "Union Artistique" is the Paris club wherein artists and amateurs most do congregate, and the annual exhibition is a sort of forerunner of the Salon. On Monday next the exhibition opens. This year there is an increased amount of dissatisfaction among the amateur members on account of the stringency of the arrangements. The committee considered that the limited wall space in the club gallery would be better occupied with works by eminent painters than by the products of praiseworthy efforts of titled and rich folks to overcome *ennui*. Paintings by amateurs are excluded, and it will not be surprising if the treasurer of the club finds that all the annual subscriptions of three hundred francs are not renewed.

A MEETING has been held in the chapter-house, St. Paul's, to organise a committee and obtain subscriptions for the erection of a memorial of the late Bishop of LONDON in St. Paul's Cathedral. Dean CHURCH, who presided, said they had undertaken to recommend the simplest, the most personal, and the most old-fashioned kind of memorial—that was, a monument in St. Paul's. There was something grateful to the sense of loss in the fact that such a monument was not utilitarian, but appealed to the imagination and the feelings. Whatever else might be proposed, this, at any rate as far as they were concerned, was the first step. It was resolved that the monument should take the form of a recumbent statue. The estimated cost will be about 3,000*l*.

ABOUT a month ago several tenders were sent in for the enlargement of a dry dock at Ostend. It was subsequently discovered that one by M. GOOSSENS, of Schaerbeek, was excluded because the provincial governor at Bruges believed that the letter did not arrive at the time appointed. On investigation it was ascertained that the delay had been caused by an oversight in the chief post-office in Brussels. The postmaster at Schaerbeek has certified that the letter was received by him and duly registered at such an hour that under ordinary circumstances the letter should have reached its destination in time. It so happens that M. GOOSSENS' tender was lower than the others. The cause is under the consideration of the Government.

THE partition of an estate among a few heirs in proportion to their respective rights is not a difficult operation to a surveyor having experience and prudence. But the lawyers with customary ingenuity contrive to make it expensive. Mr. Justice KAY on Saturday last referred to the case of a mountain property in Wales, which contained twenty-seven acres. It was divided lately, and the taxed costs amounted to 65*l*. The surveyor's work probably cost about 5*l*. The better course in a case of this kind would be to sell the estate. It is no wonder that the judge declared the transaction to be an utter scandal to our system of procedure.

THE German lithographers, like the majority of trades in the empire, are endeavouring to carry off orders for work from this country, and are glad to accept them, however insignificant they may appear. We have heard that commercial travellers from the Fatherland have been soliciting such small things as the fancy labels for buttons and gim-crackery in Birmingham, and the majority of the Christmas cards which have been lately seen in shop-windows are of German origin. At the present time there are probably a hundred of these men seeking orders for printing and lithography in London alone. In spite of the reputation which the French lithographers possess, the Germans are endeavouring to compete with them in Paris and throughout the country. As a means to retain the trade, it is proposed to establish a special art school for lithographic draughtsmen in Paris, and the municipal authorities have voted a sum in support of it. The Ministers of Commerce and Public Instruction have also given their support to the project.

ONE of the most effective arguments against waste in the combustion of coal, and the consequent fogs of the metropolis, is furnished by a statement of a Governor of

the Gas Light and Coke Company. The fog on the 20th inst. was not exceptionally thick, nevertheless 96,000,000 cubic feet of gas were supplied from the Company's works during twenty-four hours. The amount was an increase of 37 per cent. over the supply required for an average day in January. The cost to the customers of the Company for the extra amount of gas required for that one day was 5,250*l*. As nine thousand five hundred tons of coal had to be carbonised in order to produce the gas, it is not surprising that in the north of England mining engineers are foreboding the exhaustion of the coal-fields within a calculable period.

THE villa in the isle of Elba which was occupied by NAPOLEON after his abdication has been purchased by the Jesuit Fathers. It is their intention to convert this historic mansion into a college.

THE returns of the Corporation surveyor of Birmingham denote a slight increase in 1884 over 1883 in the number of plans of buildings which have been submitted for approval. In 1884 there were 1,285 plans, and in 1883 fifty less. The number in 1882 was only 963, which was a large falling off from 1,594 in 1881, thus exemplifying the state of trade. Improvement in Birmingham may be taken as an omen of the state of trade in other parts of the country, and accordingly the figures mean more than may appear at first sight.

THE severe regulations for the admission of pictures in the International Exhibition of Antwerp have given dissatisfaction to many painters. It is, therefore, proposed to organise a rival exhibition at Brussels, and the younger artists of Belgium have promised their support. The result will be a modification of the official regulations. In connection with the Antwerp exhibition, it is proposed to organise a lottery on a large scale in order to obtain means to send workmen from all parts of the kingdom to Antwerp during exhibition time.

MR. W. D. MCKAY, R.S.A., is advocating a redistribution of art treasures, and that the national collections in London should be divided and placed proportionately, according to value, in the capitals of the three kingdoms. The principle Mr. MCKAY adopts for a standard for the partition is the relative proportion of purchase money which has been contributed by taxation. But he admits that as England has paid about five-sixths of the whole, the Gallery in Trafalgar Square should have a preponderance of works. There is a good deal to be said for the proposal, and the Trustees of the National Gallery will no doubt have their attention drawn to it, but we hope it may not influence them against lending works to the Scottish Gallery.

THE French claim the invention of gas-lighting for a countryman—PHILIPPE LEBON. It has been resolved to erect a statue of him before the Hôtel de Ville at Chaumont, his birthplace. There was a competition lately for it, and M. PINCH has obtained the prize. A sum of 19,000 frs. has been placed at his disposition by the committee to defray the cost of execution of the statue.

THE following arrangement has been adopted in the Palace Hotel, San Francisco, for the purpose of protecting the building from the effects of earthquake shocks. A series of iron rods, hooked together, were extended under each floor, north to south and east to west, from one outward wall to the opposite one. Beyond this the massive beams were sawn to the thickness of about six inches their whole length, and then bolted together. The effect of this would be that, on a severe undulation, each portion of this enormous building would help to bind together and uphold the other, while any strain and crack of one part of the beam would not of necessity extend to the other part. The hotel is of massive construction, with walls 4 feet thick; but according to BASIL HALL, the traveller, the only houses that stand shocks are those built of the lightest materials and connected in the most superficial manner with the ground. All the rest, with deep foundations and thick walls, being rivetted as it were to the surface, were exposed to the full violence of the movements.

*Spillmann & Co. Wien, 1860*

# AUSTRIAN ARCHITECTURE: PALACE OF PRINCE KINSKY.

SECTION THROUGH GRAND STAIRCASE.

## ILLUSTRATIONS.

## THE GUITAR PLAYER.

THE American painters who live in Paris may well be considered as picked men, and it is no easy task to uphold a competition against French artists. Mr. C. S. PEARCE is one of the youngest and ablest of the band, but his pictures are always to be found placed by French juries in good positions in the Salon. The fine *Guitar Player* will suggest his style.

1. THE PALACE OF PRINCE SCHWARZENBERG, VIENNA.

2. THE PALACE OF PRINCE KINSKY, VIENNA.

WORK, which deserves to be called magnificent, is now in course of publication in Vienna. It is illustrative of the palaces in the city belonging to the Austrian grandees, and has been produced with the approval of the Minister for Education by Professor G. NIEMANN, the architect. The pages measure about 26 inches by 20 inches, and are all engraved on copper from the Professor's measured drawings. We have reduced two of the plates in order that they may give a better notion of the character of the originals than is possible from a verbal description. There are five large plates in each part, and the price to subscribers is only six marks.

Professor NIEMANN selects the buildings which represent that free interpretation of Italian or Classic work called "baroque." Each palace is a new variety expressing a fancy that was not always restrained, and there is a resemblance between some of the parts and those which are found in country houses erected in the eighteenth century in this country.

One of the views shows the palace of Prince SCHWARZENBERG, which is a well-known object in Vienna, standing as it does at the corner of two roads and facing a street. There is a very long garden attached to the building, and it is the garden front which is seen in the illustration. The second building is Prince KINSKY's mansion. The frontage is narrow, but the interior is palatial, and throughout much of it the effect is derived from sculptured figures. Professor NIEMANN's plates are interesting and valuable from the subjects, and as examples of architectural draughtsman-ship.

## ART AS A PROFESSION.

ON the 22nd inst., Sir W. Fettes-Douglas, the President of the Royal Scottish Academy, distributed the prizes to the students of the Edinburgh School of Art. In addressing the senior students who might be thinking of adopting art as a profession, the President said:—I am not one of those who profess to hold art genius very high; but unquestionably the artist must possess a certain volume of general capacity, certain special qualities, and a keen love for his art, and the student devoting himself to it as a profession must remember not only that he has chosen it as an intellectual study, but has to master it as a bread-winner for life. While it is always a very serious question with the young what trade or profession they will commit themselves to, a decision in favour of art is peculiarly dangerous, because few who do so have afterwards the courage to change, even when glaringly unsuccessful, but drone on to the end of the chapter, dissatisfied, and it may be beggared, men. If I am asked how the student is to acquire the necessary knowledge of himself and his powers, I must reply, it is no doubt difficult; but he ought not to seek it through the admiration of friends; and for once let him even ignore the approbation of parents, which in this matter is worse than useless—is, in fact, deleterious and demoralising. If he knows how to profit by them, let him listen to the sneers, the jibes, and even the praise of his fellow-students; their opinions in the main are honest and not incompetent. It is not only of the most vital importance to the student that he should consider thoughtfully what his general capacity and his abiding love for art may be before he chooses it as a profession, but he must exercise some judgment in his line of action, his choice of subjects, when in experience and knowledge he may fairly term himself an artist; and this entirely irrespective of his innate ability, as neither judgment nor common sense necessarily accompany talent or genius. I think the young artists of to-day are in this matter, as in many other things, in advance of my contemporaries of forty to fifty years ago. I remember very well we all commenced independent art with a very high flight indeed. Whatever the student's tastes or tendencies might be, his first exhibited picture—or,

rather, the first picture he offered for exhibition; many of you will, I dare say, understand the distinction—had its subject taken from Milton's "Paradise Lost," or the sublimer books of the Old Testament. The student then condescended to the soberer scenes of national history or the more severe and striking points in the Waverley novels. I well remember the Master of Ravenswood was a great favourite. After some years' work upon subjects of this kind the fire of his imagination became damped, and, assisted probably by the stimulus of a hungry stomach, he tried his powers—generally more successfully—on familiar subjects and cottage-door scenes. Sometimes the illustrator of Milton became a landscapist, and when the worst came to the worst he could always turn a critic. The student painter of the present day is much less ambitious. The whitewashed gable of a cottage, sans door, sans window, with an amorphous tree supporting it, is his first ambition, and apparently embodies the full outcome of his imagination and fancy. In a year or two he extends the scope of his subject by adding a water-barrel, a cart without a horse, a few cabbages or the like, and finally ventures to introduce a something, without form or comeliness, which does duty as a figure. Simple, even paltry, as many such subjects may seem, they contain in their treatment the germs of a truth to nature unknown to the artists of fifty years ago. Yet something may be said for the students of the older school. By painting subjects too high for their powers they had to attend to their drawing, and continued to study the antique long after the practice of their successors leads them to abandon what they seem to consider schoolboy practice. Apart from the fashion of the day, which influences art—I am sorry to say much more than it is influenced by art—the artist must endeavour to choose such subjects as will enable him to do justice to himself—that is, to his own powers; and a knowledge of what he can do and of what he cannot do is the most desirable of all knowledge either for the man or for the artist. Long years ago I knew a painter of much ability who painted animals, and especially barn-door fowls, with infinite beauty. Unfortunately, he became possessed with an idea that he was intended for better things. *The Hosts of Heaven, Satan Addressing His Legions*, and such like subjects, were the only pictures he could be persuaded to paint; and when a lover of art went to him to get a few cocks and hens, he was offered *A Council of the Gods on Mount Olympus*, or *A Scene in Pandemonium*. Of course the proposing purchaser went away pictureless, and shrugging his shoulders, leaving the artist swearing at his want of taste, when he ought rather to have sworn at his own lack of sense, setting aside the folly in his choice of subjects. I must admit that my unfortunate friend, while he could paint ducks delightfully, could impart neither fire to his fiends nor light or love to his angels and archangels. Before long people ceased to ask for what he refused to give, and he was neglected and forgotten. The painter of whom I have spoken was not, however, a student, but a very accomplished artist, and in his folly he sinned, not only against himself, but also against his family, who suffered severely, and against society and political economy; for whereas his earlier works were sought for and highly valued, and likely to remain valuable, adding not only to his individual wealth, but to the wealth of the world at large, his latter productions were worthless, and have been burnt and destroyed long ago. I may add *en passant* that he was not an Edinburgh man, or in any way connected with Scotland.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the Association was held on Monday, the president, Mr. G. Washington Browne, in the chair. Mr. Henry H. Gunn read a paper on "Geology in its relation to Architecture." Referring to some of the benefits which architecture had reaped from the prosecution of economic geology, he said that from the Laurentian to the recent period, and he might say to the present time, geological agency had been greatly instrumental in furnishing those materials which so much tended to the embellishment and comfort of our homes. Having described the useful minerals obtained from the various rock formations, he traced the history of the transition from one form of dwellings to another, beginning with primitive man and following the narrative up to the present age of advanced civilisation. With the discovery of bronze, doubtless, came the earlier employment of stone in buildings; and when they considered the enormous blocks that were extracted by the early Egyptians with bronze tools they were lost in mingled admiration and wonder. It was highly probable that the earlier workers of stone were acquainted with some means of tempering copper or bronze, without which it was hardly possible to conceive in what manner they could have produced the results which were to be found in the ruined cities

of ancient Egypt and of Thebes. The precise period at which iron came to be employed in the arts was lost in dim obscurity, but there was no doubt that its discovery was one of the greatest boons to mankind, for on its application was founded every important step which marked the progress of the human race from barbarism to civilisation. The lecturer proceeded to enumerate and describe those metals and their products which were of chief importance to the architect, and which embraced iron, copper, lead, zinc, and tin. Silver and gold were employed only to a slight extent in architecture, although in ancient times they were largely used in the decoration of temples. At the close a vote of thanks was awarded to Mr. Gunn for his paper.

### GREEK INSCRIPTIONS.

A COURSE of six lectures on "Ancient Greek Inscriptions" is in course of delivery at University College, London, by Professor Newton, of the British Museum. In the first lecture the professor said that ever since writing came into general use among the Greeks, say from 600 B.C. to the latest period of the Roman Empire, it was their custom to engrave on some permanent material all their public documents, such as laws and decrees, treaties, letters from foreign states, kings, emperors, and other potentates, registers of state treasure and public accounts, dedications to the gods, and the like. The material on which these documents were engraved was usually marble or limestone, which abounded in the eastern part of the Hellenic world. In Italy and Sicily the material used was more frequently bronze, and hence the comparative rarity of inscriptions in the cities of Magna Græcia and Sicily. In order to form an idea of the wealth of inscribed monuments in a Greek city of any political importance, we should imagine an intelligent foreigner, say a merchant from Alexandria, Sidon, or one of the Greek cities in the Black Sea, visiting Athens in the second century before Christ. From the moment of landing at the Piræus to the termination of his visit this foreigner would have seen on every side the monumental record of the past history of Athens. Those documents which we bury in Blue Books—statistics at large, Foreign Office archives, canons, and rubrics—were patent everywhere. At the Piræus the stranger would have seen engraved inventories of the ships and naval stores of the Athenian navy, and the contract, with exact specifications for the building of a place for naval stores in the arsenal. Ascending from the Piræus along a road, at the side of which he would have seen sepulchral monuments commemorating the illustrious dead, the stranger would have reached Athens, where his first visit would naturally have been to the Acropolis. Within that hallowed precinct he would have seen not only on separate columns (*stelæ*), but on the walls of the Parthenon, and other public buildings, the imposing record of the greatness of the Athenian Empire; the offering to the gods dedicated by victorious commanders in memory of battles by sea and land; the treaties and alliances which were the fruit of those victories; the honours accorded to public benefactors, native or foreign; the lists of the State treasure stuck up in the Parthenon and the other temples; the public accounts, with which were included the contributions levied by Athens on the cities of the confederacy formed for the defence of Hellas after the Persian war. Descending from the Acropolis the stranger would have seen at its foot the long row of bronze tripods dedicated by the victors in dramatic, lyrical, or musical contests, and the whole system of gymnastic and agonistic training recorded year by year in a series of decrees relating to special festivals, with lists of victors and dedications in gratitude to the gods to whom they owed their prowess. If, lastly, passing through streets crowded with statues of gods, heroes, and illustrious men, the stranger had issued forth from one of the city gates into the country round Athens, he would have walked along roads flanked on each side by a row of tombs, each inscribed with the name of the person or family buried, together with the name of his "deme," or, if a foreigner, of his country, and in the neighbouring fields he would have seen the boundaries of each man's property carefully defined by pillars on which were engraved the name of the owner, with the additional information, in case of mortgage or marriage settlement, that the land was subject to it. The inscribed monuments of Athens here noted must be a very small part of what once might have been seen; but they have this special interest, that for us, as for the ancients, they still exist, in a condition more or less complete. In the present state of our knowledge of Greek epigraphy we may confidently assert that inscribed monuments of equal, and perhaps of greater, interest abounded in every Hellenic city of any political importance, and there is good ground for supposing that a considerable salvage of their remains will be accomplished as systematic excavations on ancient sites are carried on on a more extended scale. The lecturer then referred to the efforts made by learned men in the Alexandrian period to preserve from oblivion the precious historical materials

contained in inscribed monuments, and concluded by an earnest appeal to all who are interested in archæology never to fail to copy inscriptions when they are exploring Greek sites; and further, he would exhort the owners of sculpture galleries to make a careful examination of all marbles, whether cast forth into holes and corners of gardens, rock-work, or mouldering in London cellars. Moreover, there must still exist letters and diaries of English travellers in the Levant containing copies of inscriptions which have never seen the light since the last century. In a diary recently placed in the lecturer's hands, and bearing date 1737, he found a most interesting inscription from Halicarnassus, not published till after he recopied it at Budrum, in 1855. There may be many more such unpublished treasures in family archives.

### HOUSE TENURE IN GERMANY.

THE report on the system of tenure in Prussia and Germany generally, which was prepared for the Foreign Office at the English Embassy, in Berlin, says that house property is invariably held in freehold tenure, and the system of letting land on long building leases is practically unknown. This is supposed to be due to an old principle of law by which "sale breaks lease," and no person would be disposed to erect, at his own cost, a permanent structure on a piece of ground held on such uncertain tenure. An eminent legal practitioner in Berlin, who is conversant with such matters, was consulted, and he gave the following reply:—In general terms the rule of law is that—1. Plots of ground—leaving out of consideration cases where they are leased for temporary purposes for specified terms—can only be sold as freehold property. The old "institution" of heritable leases ("*Erbpacht*"), ceding the usufruct of a piece of ground in perpetuity in return for a yearly rent, was abolished in the year 1850. 2. The law places no restriction on the subdivision at will of such ground into any number of larger or smaller lots, or on the sale of such lots.

The only restrictions to which an owner would be subject who was desirous of building on such lots in country as well as in town districts would be:—(a) Legal restrictions, in the case of buildings for commercial or industrial purposes and the like, imposed for the purpose of preventing any prejudice to the convenience, safety, or health of the public. (Imperial trade regulations.) (b) Police restrictions, imposed with the object of securing proper access to the dwelling-house, and its proper sanitary condition, and further to provide for the arrangements of the structure being kept strictly within the limits of any plan which may have been fixed or approved by the municipal authority. (Building regulations.) (c) Private restrictions, arising out of any covenant or agreement, which may have been entered into between vendor and purchaser as to the description of building to be erected, or the use to be made of the ground sold. Agreements of this description are quite admissible in law when not opposed to the public interest, or in violation of the State Laws or Police Regulations. They are binding on the legal successor in title of the purchaser only when entered as limitation of title in the property in question in the ground register ("*Grundbuch*") in which the property thus limited is duly entered. The sole persons entitled to demand the observance or fulfilment of such restrictions on the property would be the owner of the ground duly registered as conferring such right, the original vendor of the property, or his successor in title, to whom the right to do so has been expressly conveyed. No other person, not party to the original contract, nor subsequently made a party to it by express act, can claim any power to enforce the vendor's rights.

1. Property can be legally sold in small lots so as to enable persons to build houses thereon; but in each case a fixed price in one sum must be given. Yearly rents or other periodical payment are not admissible. The vendor may at the same time retain certain real rights.

2. In the contract or covenant, which is absolutely governed by the law of free contract, conditions may be inserted binding the purchaser to build or employ the ground purchased in a particular manner. If this restriction is properly entered in the "*Grundbuch*" as forming a real lien on the property in question, it can be enforced by legal process. No special legal or customary restrictions exist in the case of any particular class of purchasers.

3. Such restrictions, as long as they are properly entered in the "*Grundbuch*," may last for ever, and can be enforced by the action of the party expressly entitled to claim their observance. In the special case cited, *i.e.* where a purchaser has covenanted or agreed to use a house as a private dwelling-house only, and turns it into a shop, the purchaser who had expressly covenanted to use a house as a dwelling-house only would not be at liberty to use it as a shop or store, against the rights of the vendor or his legal representative. 4. The enforcement of the restriction in question could only be claimed

by the person expressly empowered by the contract to do so, and by no other. This follows from the very nature of the contract. If the property be re-registered in the "Grundbuch" as conferring this right, a course quite permissible, the owner of such property would be in the case cited the legal prosecutor. Neighbourhood *per se* confers no such right, which can only be derived from contract.

In Bavaria the land is held by about 458,416 independent landowners (with 1,047,596 labourers), ranging from the small proprietor owning a few cows, and the peasant who works on his own land with his labourers, to the owners of large estates whose possessions may almost be compared with those of English landlords. The average size of an estate (arable land or wood) in Bavaria is only 5.74 hectares; in Hanover and Pomerania, 20.93 hectares; in Silesia and Brandenburg, 16.36 hectares; whereas in England, of the total area of 13,205,406 hectares, not less than two-thirds are in the hands of 10,207 persons, each of whom owns more than 200 hectares. Thus, in Bavaria small estates are the rule, and when the electoral lists were prepared according to the law of May 26, 1818, there were only 7,182 landowners qualified for election, *i.e.* landowners possessing estates of the value of 8,000 fl. to 10,000 fl. (13,714 to 17,142 marks, or 685*l.* to 857*l.*).

Apart from some cases of entailed property, which can exist only among nobles, the ownership of land, its transference *inter vivos*, and the leasing and the letting of it, have been treated, since the year 1848, not according to feudal principles, but solely according to the principles of common law (the common law, as is well known, not recognising even in land an ownership restricted by law as to succession), and it allows to the individual owner the greatest freedom with regard to the disposal of his property.

In the year 1855 an attempt was made by the passing of the law concerning hereditary landed property to reintroduce a certain degree of restriction with regard to succession, if only as an optional measure, but the small amount of popularity gained by this experiment has been practically shown by the fact that hardly any advantage has been taken of this ability to create such hereditary estates. As "latifundia" does not exist in Bavaria, where large estates are limited in number, the system of leasing estates and letting land or building plots plays a very subordinate part; whereas in Great Britain the farmers, renters of building plots, and builders form a highly important class.

Leases for 60, 99, or 1,000 years are unknown in Bavaria. "Erbpacht" (emphyteusis) and "Platzrecht" (superficies)—hereditary and transferable rights with regard to land or houses belonging to other people—very seldom occur. Single dwelling-houses are seldom let entire, but, as a general rule, only the apartments of which they consist, or other portions or dependencies, such as stables, *ateliers*, &c. As a proof of the extent to which everything in Bavaria favours the principle of separate ownership in landed property (even in miniature), may be mentioned the so-called "Herbergen," or working-men's dwellings, in Munich and its suburbs, in which different floors of the same houses are owned by different people. The periods of leasing and letting are comparatively short; in Munich, for example, apartments can be quitted or taken twice in the year—on St. George's Day (April 24) and Michaelmas Day.

### CHURCH RESTORATION.

A LECTURE on church restoration was delivered on the 22nd inst. by Mr. C. Hodgson Fowler, F.S.A., F.R.I.B.A., before the members of the York Architectural Association. Mr. A. Pollard, president of the Association, occupied the chair, and there was a large attendance. Mr. Fowler, in commencing his address, explained what was meant by the term restoration, and asked those present to assume that they had met together as a committee to restore an old church, this being, perhaps, the best subject upon which they could base restoration. They would first make a careful inspection of the church, and prepare the drawings, &c., for the work. The latter brought the archaeological knowledge of the architect into play. He would have to deal with the general character of the edifice, and if there were any of its features destroyed, such as tracery, &c., and it was necessary to replace them, he should not evolve any substitution from his inner consciousness, but visit two or three churches in the district, where he would be almost certain to find some key to his difficulty. Having stated that local characteristics should be studied, the lecturer proceeded to consider the imaginary building in detail. He first dealt with the masonry, to which, he urged, it was a most important rule to do as little as possible compatible with keeping the building in a sound condition. Next the piers and arches would have to be considered, then the main walls, and the carving, which in its decayed state was more interesting than new work, and would give to the student of architecture or carving many good hints. Turning to what ought not to be done, the lecturer deprecated the cutting out of mouldings

which were quite perfect, and said the proper jointing of old work was a point often overlooked. He then dwelt on the dressing of stone, the tiling of floors, and the tracery (which he said should be maintained even if worse for wear), and said that those present should ever remember that they were students, and that the "sermons in stone" that our churches would preach to them were more valuable than any number of books. He next spoke of the present system of plastering, and expressed the opinion that the plaster of the existing period would not endure as long as that of old, which lasted five or six hundred years. Then he came to the woodwork, the roof, the seats, the plumbers' work, glazing, and having finished with the fabric, he turned to the monuments and fittings. With regard to the monuments, there must, he observed, be preservation rather than restoration. Many of them would present no difficulty—the application of a little soap and water being all that was necessary. Mr. Fowler afterwards impressed the great need of personal care, and said that if it were not given mistakes would occur which the architect would regret. It would be impossible for a man to give as much care as he would like to give, but he would find that every iota of care and diligence would be reflected in his work.

A vote of thanks to the lecturer, moved by the chairman, was seconded by Mr. G. W. Penty, who said those present had listened to words of authority upon the subject of restoration. Thanks to the exertions of Mr. Street, Mr. Fowler, and others, architects now had a better conception of what actually was true restoration. The vote of thanks was then passed, and Mr. Fowler, in replying, said he thought that restoration would be a favourable subject on which to speak to them, as they lived in a city with so many interesting buildings. If, therefore, he had afforded them any information, he would be recompensed for any trouble he had taken.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### A PAINTER'S DIARY.

ONE of the saddest stories in the history of British art is the career of Samuel Ford. Competent judges have said that if he lived he must have been among the greatest artists of the century, and the few paintings he has left, although little more than fragments, confirm that opinion. Ford was a native of Cork, where he was born in 1803. In those days it was difficult to attain knowledge in Ireland, but the Cork people somehow managed to preserve a genuine interest in literature and art. "I listened to two boys, almost in rags," says Thackeray; "they were lolling over the quay balustrade and talking about one of the Ptolemys, and talking well too." Ford was like one of those boys, and during his youth, in spite of misery and hunger, he acquired a knowledge of languages and literature that would do credit to a university student. There were more facilities for studying art. In a room of the Corn Exchange was a collection of casts from the antique (and we believe it is still there), which had been presented to the Prince Regent by Canova. The casts were useless to the prince, and eventually they found their way to the cockloft near the Lee. Maclise and Ford spent many a day together before them. Another advantage was derived from the shapely figures and intelligent faces of the people. "I never saw such a collection of bright-eyed, wild, clever, eager faces," continues Thackeray. "Mr. Maclise has carried away a number of them in his memory, and the lovers of his admirable pictures will find more than one Munster countenance under a helmet in company of Macbeth, or in a slashed doublet alongside of Prince Hamlet, or in the very midst of Spain in company with Senor Gil Blas. Gil Blas himself came from Cork, and not from Oviedo." Maclise, having Scotch energy, worked his way to London, where he could study and win fame. The gentler Ford, who was the finer genius of the two, remained in Cork, and for a living became master of the Mechanics' Institute. He tried to paint, but he was so poor that he was often unable to buy materials. A few of the Cork people came to his aid, but it was too late. The following portion of a diary has been preserved, and it reveals the visions which flashed before him, and the misery which awaited him when his ideal world vanished:—

June 15, 1826.—Began the design for the ceiling of the theatre. The idea of the *Vision of Tragedy* was caught from Milton:—

Sometimes let gorgeous Tragedy  
In sceptred pall come sweeping by,  
Presenting Thebes or Pelops' line,  
Or the tale of Troy divine.

The first thought was Tragedy sweeping on, while the bards are raised to view the wonders of her power, and the distance was to be the arena of some tremendous catastrophe drawn from the far times of the earth. It by degrees altered to the form in which I painted it in the cartoon.

August 9.—Thought of an exhibition of six pictures: *Prophecy of Balaam, Macbeth consulting the Witches, Œdipus, Romeo and Juliet in the Tomb, Tempest, Retreat of Charles the Fifth.*

February 1827.—I think it is better not to attempt subjects except they are called for, because I am led away from them before the mind has had time to mature any one idea connected with them. Even, in the first instance, the mind cannot take sufficient interest in them, at least only for a very short time, no properly substantial end being in view. The mind, I think, by this vagrant mode of action, will lose its strength—irritation is the common result of those trials; for they are trials made under the very greatest disadvantages. I am in doubt whether it would not be better to avoid making even the slightest sketches of subjects, choosing rather to give the mind a habit of looking abroad at the proprieties of things, and leaving it thus to gain strength which can effectually be used when the proper time comes.

November 1827.—Painted *Crucifixion* for Skibbereen, from two o'clock, November 8, to half-past two o'clock, November 10. Painted in light and shadow, glazed with sienna and lake.

November 12.—Settled once more in Cork.

January 22, 1828.—A theme occurred to me—a figure in crimson drapery rushing through a stormy sky on a white horse—blue clouds underneath—behind the horse a dash of lightning, merging into murky purple overhead.

February 4.—Bacchus in India might be made the foundation of some wildly gorgeous, romantic scenes. Now, I should wish to be able to give ideas of the imaginary spectacles that are presented dimly to my mind—scene on the shore, among the rocks, such as Bacchus might have sat on, when the pirates took him—the quiet, fresh loneliness of a smiling world rarely seen by mortal eye, a dreamy kind of half-spiritual place. How much there is that may be done—how little I can do. The circumstances of the present time will, perhaps, in some respect, exert an unfavourable influence over the future—in other respects not so—certainly all the products of God's care. I do not know that I have once in all my life said "thank God," when the plans of my own formation were obstructed.

February 10.—"And the sea gave up the dead that were in it"—the general resurrection—one of the grandest, most pathetic themes. Shall I ever be enabled to give it all the wildness and beauty that I imagine of it? Began the *Fall of the Angels*. Drew the lines.

February 12.—Distant rock and general effect in umber. Painted by night.

February 13.—Glory round the throne. By night.

February 14.—Throne. By night.

February 15.—Cherubim. First day.

February 16.—Battlements of heaven. Second day.

February 23.—Dead-coloured the second group of angels. By this time I had copied the sketch of the first group on the canvas. Mr. Penrose called yesterday to see *Tragedy*, and to-day he came to see the *Angels* with Mr. Newenham.

From this day I began to think no more of it as to the exhibition. I was ill, and occupied with other things, till Mr. Deane [known afterwards as Sir Thomas Deane, architect] on Friday, March 28, promised to supply me with thirty shillings a-week while I should be engaged in the execution of that picture. Brought it home that evening, and began a sketch of the front figures in light and shade.

February 25.—Yesterday saw Michel Angelo's *Fates* shadowed for the first time: saw a small outline of them nine or ten years ago. I remember I did not think them *Fates* at all then. Though there is not majesty and terror enough about them, and the conception is certainly not adequate to the dignity of the subject, yet there is enough of power in it to proclaim the author possessed of great requisites in his art, requisites most lamentably wanted nowadays. Compared with this work all that I have done, almost without an exception, appears weak and inefficient, vapoury and unreal—practical, perhaps, but unsubstantial and insipid. That would never do for me.

Saw the fine woman from the Lower Road. She is, indeed, a magnificent creature: her very cloak folds round her in the grand style. At the distance of the breadth of Patrick Street, when the features were all indistinct, there was yet quite legible the energy or the intensity of feeling dwelling in them and arresting the mind to the momentary study of them. How wretched the generality of heads in comparison with that of this woman!

A whim occurred to me the other day of Valentine and Orson serving as the ground of a gallant display of pictorial energy—a romantic story, certainly—part, at least, very pretty. I don't remember the whole.

Mr. Crawford called on me, Wednesday, March 26, and

brought me five pounds. On speaking to Mr. Willis the next day, he offered and gave him five pounds more for me, in order to go to London.

April 5.—Being without money, I changed Mr. Crawford's five-pound bill, and intend to replace as soon as I hear from Mr. D.

In the course of the month of March, Doctor Murphy, South Mall, offered me as far as ten pounds to go to London.

Mr. Corbett wished me to paint a picture for him for two guineas. I was, and am, much obliged to him, it showing more wish to do me a service in the right way in him than all the talking of those who let it take the place of doing, even a little.

Saturday, April 12.—On Wednesday, April 9, I got the order of the foreground of the *Fall of the Angels* completed in umber; on Thursday I began in a purple tint to shadow forth the distant armies; Friday, I nearly completed (for the time) the cavalry in the middle space; to-day I brought that part to a close, and began to lay the neutral tints on the upper figures of the foreground. I was five days occupied in rubbing in the foreground in umber—a proof of the interruptions I continually experienced from languor and incapability of lengthened exertion—and besides all that, one or two doses in the way of old jobs that discomposed me not a little. I received three pounds from Mr. Deane to-day, for the fortnight passed.

April 14, Monday.—Rubbed in the foreground of the right-hand portion in body colour, which I found too dark. I changed it by brightening the figures with the high lights, and brought it to bear, as far as I went.

April 15.—Finished a small portion of a few of the figures—a head and breast, a leg, a head turned down.

April 21.—Invited by Mr. Morgan to finish the picture at his house for the sake of my health.

April 22.—Went to breakfast at Mr. Morgan's. Charmed with the place appointed for me.

April 23, Wednesday.—Sold the picture to Mr. Penrose for thirty guineas.

April 24.—Sent the picture to Tivoli [a house near Cork], rolled up—not painting since Monday.

April 25.—Received five pounds from Mr. Penrose. Got the picture on the frame.

April 26.—Began to paint at Tivoli.

April 28, Monday.—At home—took medicine—doing nothing. The chain of events seems as it were unwinding itself, and by the mercy of Eternal Deity each unfolded link is endued with the power of shedding a greater degree of repose over me now, and of throwing a quieting influence over me while in the contemplation of the distance.

May 5, Monday.—Since last Monday I have been at Tivoli but a few days—the foul weather, languor, and medicine kept me loitering, and when I did get there, weakness prevented me from doing scarcely anything. This day I was enabled just to give an appearance of finish to the upper part—lower part untouched. Mr. W. thought it looked very well, saving the bottom ruins, but it would require more nerve than I possessed even to begin to touch on them.

May 11, Sunday.—Since last Monday I have lain in bed. The love of the Eternal was surely displayed in choosing this time for this dispensation—a time when I could lie calmly and bless Him for the fullness of the store He had laid by me.

The entry for May 11 in poor Ford's diary is suggestive of that euthanasia which seems to be a compensation to poets and artists for their past troubles. He died on July 28. The entries afford opportunity for comment. It will be observed, for example, that one of Ford's dreams was to paint the subject which Sir Frederick Leighton afterwards selected for a panel for the dome of St. Paul's. His recognition of the superiority of Michel Angelo, although he could only have seen a print of one of the works of that master, speaks well for Ford's judgment.

## BURMESE BUILDINGS.

ACCORDING to a correspondent of the *Times* the present capital of Burmah is Mandalay, a city built on a site which twenty-five or thirty years ago was mere jungle. The capital has frequently changed its site, having since 1740 been at Ava three times, at Amarapoora twice, and at Monchobo twice, but since 1857 it has been fixed at Mandalay. Mandalay is enclosed by a square brick wall, 26 feet high, crenellated at the top. Twelve gates pierce the wall, and from these macadamised roads, 100 feet broad, intersect the city. The number of houses inside the walls is supposed to be about 13,000, and the population is estimated at about 60,000. Within the city walls are the king's palace and gardens, the treasury, arsenal and powder magazine, and mint. The houses, as a rule, are mere huts, raised on piles of 5 or 8 feet high, and made of bamboo, with thatches of leaves, but there are some houses, particularly those of the Chinese, in which masonry is employed. In many respects Mandalay is superior to most Indo-Chinese cities; there is not the squalor to be seen in the

Siamese or Cambodian capital, and, thanks partly to the army of dogs and pigs, the streets are fairly free from evil smells. Bhamo, the extreme northern limit of navigation by steamers on the Irrawaddy, is a town about a mile long, situated on the left bank of the river, with a population of about 2,500. Amarapoora, a city nearly a mile square, and more than once the capital, had not many years ago about 90,000 inhabitants. The number of pagodas and monasteries in and about the principal towns of Burmah is vast beyond belief. Pagan, the ruins of which cover an area of 16 square miles, situated on the left bank of the Irrawaddy, is famous for its numerous temples, to count which is one of the proverbial impossibilities of the Burmese. This town is said to have been in remote times the residence of a long dynasty of kings. Other large towns are Yenangyoung, the centre of the petroleum trade; Magwé, and Minhla; besides which there are other considerable towns and villages along the river and in the interior.

Burmese houses are so fragile that towns quickly spring up or become deserted. When a royal whim, or the caprice of the court astrologers, dictates a change of locality for the capital, an order goes forth that the old city be abandoned, and commanding all loyal subjects to move into the new one. The houses are not so well put together that they cannot be easily taken to pieces, transported a few miles, and re-erected; but the abandonment of crops in the ground, and possibly of the business connection which traders have created in a certain locality, which may not fall in their way again, involves serious loss to people living in the capital, and, of course, retards the progress of the country very greatly. The inflammability of the material of which houses are built, and the almost suicidal carelessness of the people, combine to make conflagrations and the burning down of several blocks an episode in the life of a town-bred Burman recurring too frequently to excite comment.

### THE CHANNEL TUNNEL.

A MEETING of the South-Eastern Railway Company was held on the 22nd inst. Sir E. W. Watkin, the chairman, submitted a resolution for maintaining and continuing the experimental works for tunnelling beneath the Straits of Dover. He said he did not understand any objection to the Bill, unless on the ground of cost. There were no plans or estimates to be deposited. It was simply a Bill to keep alive the attempt to obtain an extension of the South-Eastern Railway to the Continent. Putting aside the military view, the English scare view, and looking only to the economic view, what the Channel Tunnel Company had done was this: they had proved to demonstration that the tunnel could be made, by excavating tunnels under the sea, 2,160 yards at one place and 800 yards at another. The French Tunnel Company had done the same thing on the French side, and the result had proved that the grey chalk, through which the machine easily cut its way, was of the same consistency and thickness on both sides of the Channel. The French had made 9,000 soundings, proving that there was no fault or crack, and, therefore, they had every reason to believe that the stratum was continuous. Their experiments had settled the rate of progress, and approximately the cost, the time being very small as compared with the twenty years the engineers had talked about, while the cost would be one-third of their estimate. He had not the slightest doubt the tunnel could be made for three millions, and be completed in four or five years. Viewed as a financial question, if the tunnel was made, the South-Eastern Railway would be the best property in the world. Carrying goods without breaking bulk, and conveying passengers without making them sick, could not fail to greatly benefit the South-Eastern Railway proprietors, and it was for them to say whether, in spite of all prejudice and all opposition, they should not in their own interest keep this question alive. They were partners in that important traffic with the directors and proprietors of the Northern of France, from whom the idea of the tunnel had come, and as they had a strong feeling in its favour, that was a reason why the proprietors of the South-Eastern Railway—which was really an Anglo-French line—should favour the project, even if not so perfectly convinced in their own minds of its value. It was an interesting fact that in excavating their tunnels they had come on little cracks in the grey chalk, from which small quantities of water exuded. That water was not salt, as it would have been if it had been filtered through from the sea, but perfectly fresh, and it had gradually run dry, showing that it had been imprisoned in the chalk for perhaps millions of years, and that after running out slowly and gradually it disappeared for ever. That was not only interesting geologically, but economically, in the construction of such a work as that. He reminded the shareholders that the Channel Tunnel Company had repaid to the South-Eastern Railway shareholders every penny they had subscribed on the authority of Parliament, and that the former possessed not only the experimental works, but had purchased all the foreshore from the

Martello Tower to the Shakespeare Cliff, and that as regarded the meeting, the question was narrowed down to paying the cost of that Bill, which, rather than lose, he would pay himself. The resolution was seconded by Lord Brabourne.

An amendment, stating "That in view of the present strained relations between France and this country, it is not prudent or politic to proceed with a Bill or Bills in Parliament for the construction of a Channel tunnel," was proposed and lost by a considerable majority. The resolution was then agreed to.

### Semper and Utilitarian Education.

SIR,—To "Cui Bono's" letter in *The Architect* I beg to give an answer taken from my father's own writings. Your correspondent seems to say that a book is only useful to art when it gives a man suggestions for designing. It is exactly the very point of view my father has always kept before him, both in teaching his pupils and writing his books, viz., to develop and strengthen our power of composing by analysing for us what are the different factors which go to making a work of art, or the style of a given epoch. In explaining what were the laws of composition, and from what different points of view it might be examined, my father did not wish to cramp the artist's freedom, but, on the contrary, to excite his imagination by awakening his reasoning powers, so that he might work as an independent artist untrammelled by any traditional prejudices.

The industrial arts of England owe much to my father's very successful teaching in Marlborough House, and to the part he took in the foundation of the South Kensington Museum. To the impetus they then received, English arts owe their present development, and it is unthankful from the short-sighted, practical Mr. "Cui Bono" to try to deny it. It is also well known that the great progress Germany and Austria have made in art during the latter half of this century is due to my father. Rarely has an artist had such influence on his pupils and on his time, and yet a "Cui Bono" must come and teach us that nothing worth knowing is to be got out of my father's work on "Style." Certainly everyone must learn to draw by simple application; but is the simple technique of drawing sufficient to make an artist? There is not the slightest doubt that, for a serious artist who takes a high view of his art, there is both excitement to thought and knowledge to be got out of my father's book; but of course to appreciate it we must read it—which "Cui Bono" does not seem to have done—and also understand it, for the reader must have some general education, and not be limited to the purely technical knowledge of his trade. When "Cui Bono" requires something tangible as a result of my father's teaching, let him look at my father's buildings. Was my father simply a theorist, as "Cui Bono" believes? If he wants to see whether my father was a practical man, let him read the preface to his book; he will see my father's own opinion about the importance of practical knowledge. At all events, I am happy to hear, through *The Architect*, that my father's book is going to be translated into English, for I feel confident the reading of it will sweep away all the prejudices of "Cui Bono" & Co.

HANS SEMPER,  
Professor of Art History, Innsbruck.

January 26, 1885.

SIR,—I have read with much interest the correspondence in your excellent journal arising out of the able papers read by Mr. Harvey and Professor Brown on Semper.

I am a strong advocate for a sound general education, and for an intimate acquaintance with whatever bears in a special way on one's adopted profession, or the work one has in hand. But in these days of increasing examination manuals it is a truth which cannot too often be insisted on that a man's education, or his training for any work, does not consist alone in what he acquires from books. Books are a record of thought and discoveries—a priceless heritage. But we should guard against making book-learning the "be all and the end all." Self-reliance, adaptability, resource, sympathy, quickness of perception, individuality—these are the things that make the man; these it is that make the architect. They are not cultivated so much by books as by the actual experiences of life—its wants, its ways, its moods. These are the qualities which win distinction in all walks of life. It is an everyday experience that the best divine is not necessarily the best bishop, the best student the most successful doctor, the most learned lawyer the astutest judge, the closest political economist the wisest statesman. Now it seems to me that of good works treating of

architecture there are already in England plenty to hand. To look abroad for others seems of doubtful advantage, and scarcely likely to influence for good. Architecture, like literature, customs, laws, should be a native growth, should, in a measure, show forth the national mind and temperament. Professor Brown said in his letter last week that Semper's treatment of style "is not specially original." This is exactly as one would have expected. The German professor evolved no new style of architecture out of inner consciousness. The styles of architecture are as freely at the disposal of every English architect as they were to Semper. But to these general styles he gave a local colouring—a colouring expressive of the tone of his own mind, presumably of the mind of the nation to which he belonged. Now, what I contend is, that the systems and laws of architecture should be known thoroughly to every English architect, and that he should so use these as to produce work in some manner expressive of the character of his own country.

Mr. Harvey seems offended that architecture should be fettered by any considerations of usefulness. Semper, he wrote last week, "differs essentially from those who consider architecture as the handmaid to utilitarian purposes." Surely the very *raison d'être* of architecture, of buildings of all kinds, is utility. Was there ever any building raised for artistic effect merely? Westminster Hall is now little more than a show place. "Its occupation's gone." Would such a structure be raised nowadays if it did not already exist, merely for the pleasure of beholding it, studying it, and feeling the effect of its splendid proportions? Architecture is seen at its best in churches. Here the architect is least trammelled; here he has the freest scope for his fancy, for beauty of lines and harmony of proportions. But surely Mr. Harvey will not contend that even here architecture is not the handmaid of utility. A church is a building to enclose a number of people congregated together for the purpose of religious worship. But a church ought to be more than this. By its beauty, grace, or grandeur it ought so to inspire the people within it as to raise their souls to higher thoughts, and to put them in a disposition fitting to an act of divine worship. Architects must learn to bend themselves to the fact that theirs is the one among all the arts that arises from needs, and is necessarily limited by wants. There is evidently no undecided feeling now that an almost wanton disregard for the first purposes of a building, as shown in the new Law Courts, has thrown back architecture in England for a decade.

Mr. Harvey, in virtue of his teaching, or in spite of it—for it is not clear which—shows in his detailed and very clear description of his drawing that he himself is not without this regard for everyday comfort and adaptability to circumstances. But when he talks of attempting "a poem in bricks and mortar," then surely he mistakes the scope and purpose of his art. Is he here expressing Semperism? If Lessing's "Laokoon" has escaped the notice of Mr. Harvey, it must surely have been familiar to his master. In this standard book the masterly German critic shows conclusively, with that clear insight of his own—a gift not given by books—that even a picture cannot be a poem, that poetry and the sister arts differ essentially in their symbols, their aims, and their laws.

I am afraid, Sir, I have trespassed unduly on your valuable space; but I plead in excuse a desire to see our architects men of native sentiments and aspirations, ready to make their skill helpful to the comforts of home, and able to reflect in their work the genius of our race.

Yours obediently,  
DOMUS ET PATRIA.

SIR,—In my opinion great credit is merited by Mr. Harvey for his interesting letter explaining the process of designing as carried out in his porch. Artists of every class are not disposed to take the public into their confidence and show how effects have been produced. As I said before, I must decline to criticise the porch; but I trust I shall not be transgressing if I suggest that the elements of the design are not unfamiliar to us. Similar columns, frieze, ashlar, &c., are to be found elsewhere, and I fancy that the arrangement of the door-scrapers is not altogether unique. I have no intention of implying that Mr. Harvey's skill in choosing fine types for his details detracts from the merit of his design, and merely draw attention to this fact in case any aspiring youth might imagine that a study of Semper would enable him to revolutionise architectural design. When it is said that Semper "enfranchises his followers from the tyrannical trammels of precedents," we ought to have a little stronger evidence in support of the assertion than the variation of the proportion of a column from seven and a half to eight and a quarter diameters. Mr. Harvey should know his own mind better than anybody else, but I can hardly suppose that his enfranchisement is entirely due to Semper. Does he not owe something to the Ecole des Beaux-Arts, although he has not said a word about it? To my eyes the porch is more French than German in character, and it is all the better on that account.

Professor Baldwin Brown, happily for himself, stands aloof from the troubles which beset architectural practice—or, rather, want of practice. He can afford to look down on architects who are dissatisfied when they see the good folks who have commissions bestowing them on men who profess to attach little importance to art. For my own sake I should like the English public to be as well instructed in art history as the French and Germans are, and I hope Professor Brown may do more towards that end than has been accomplished hitherto by the Slade professors in England. The outcry which the Professor imagines I have raised has not been directed against the use of Semper's or other books in University classes. If the public in general can be made to take an interest in a graceful arrangement of bricks and stone, because they see in it a testimony to "the artistic importance of seams," so much the better, although one would prefer to have the admiration based on more rational grounds. What is sorely needed at the present time is sufficient interest to allow of any expenditure for the sake of art. Professor Brown believes that the public taste is advancing. I wish sincerely I could agree with him. Within an hour after I had read his last letter I had an illustration of the extent to which architecture as a fine art is esteemed. I called on an old friend, and was not long in his office before I asked what he had been doing lately. He pointed to a couple of photographs of small stations on a branch railway. Like all my friend's work, the buildings were good in style, although simple and without a trace of anything that could be called needless ornamentation. Whoever compared them with the majority of stations would see that they were designed by an architect. But they were considered to be too good by the directors, and the plans of the remaining stations have been worked out in the engineer's office. There are educated men among the directors, yet they sacrificed the appearance of their buildings for the sake of saving a sum that was insignificant if compared with the cost of the line. Every architect could relate similar stories to Professor Brown, and, unless I am mistaken, they are heard within a very short distance of his class-room. When an architect has the spirit of the enthusiast in him and a sufficient sum for his wants at his bankers, he can afford to be philosophic under disappointments. The late William Burges was an example of this kind; indeed, his devotion to art was unsurpassed. But the majority of men are compelled to depend on their commissions for existence, and speaking generally it may be said that it is not advantageous for a man's finances when he gets the reputation of an ambition to raise "monuments which are to be among the most precious possessions of the human race" at his client's expense. Even in Government offices that ambition is fatal; and hence one looks in vain for a public building by Cockerell or Burges. We know how Street had to mar his work or lose his commission, and how Scott had to sacrifice his designs, and, as if he were a journeyman, make another on a regulation pattern. With such examples before him, is it wise for the young architect to believe that the English people have their purses always open to pay for high art in their buildings?

So much for one part of the Professor's letter. With regard to the utility of Semper's book, I hope he will pardon me for saying that my opinion has not been altered. There are other means in existence, without going to Germany, for educating a student's artistic taste, and "rendering him familiar with the great masterpieces of old time." The French manage to do without Semper; the Germans are indifferent to all but a portion of his works. Yet it is proposed, at the public expense, to bring out his book in English. Who knows but that in time the foreign engine for drawing corks, which Hogarth represents, may also be manufactured by the Government as a substitute for Sheffield corkscrews? It is not without affinity to Semper's elaborate way of producing simple things. If the Science and Art Department is desirous to bring out a book which is beyond the enterprise of Paternoster Row, let the experiment be made with Cockerell's "Academy Lectures."

Your obedient servant,  
CUI BONO.

#### Fireproof Protection of Openings in Party Walls.

SIR,—The paper read on the above subject at the Royal Institution of British Architects, and the discussion arising therefrom as reported by you (January 24), afford sufficient evidence that as a rule the provisions of the Metropolitan Building Act are inadequate to secure the protection desired. The reasons of failure are not difficult to trace. In the instances mentioned of doors made merely according to the Act, which are reported to have been successful, the success has arisen from the comparatively slight test to which they have been subjected. Whenever the full intensity of the fire has been directed against the doors by the action of air-currents, there can be little doubt that in a fire of any magnitude they have invariably failed. The immediate causes of failure are these:—1st. The intense heat causes expansion and

buckling of the door-plate. 2nd. This occasions openings between the door-plate and frame, and in the case of sliding doors between the door-plate and wall. 3rd. This, again, allows the fire to penetrate to the door fixed on the other side of the walls, which in its turn similarly succumbs, and allows the fire free passage from one compartment of the building to the other. 4th. But in the case of sliding doors, even without expansion and buckling by heat, a considerable space exists between the door and the face of the walls, at the top, bottom, and sides of the door, as mentioned by Mr. Wyatt Papworth in the course of the discussion. It follows, then, from these facts, that there can be no security in such doors (whether hinged or sliding) unless they be so firmly held in position all round their edges that no amount of expansion or buckling shall be able to draw their edges out of their rebates. This we claim to have effectually provided in our Patent of 1883.

In 1883 we were applied to by the late Mr. Thomas Chamberlain, architect, to design and supply to Messrs. Faudel & Phillips's new premises, Newgate Street, a number of large sliding iron doors, which, while complying with the terms of the Building Act, would also be really effective against a fire of the greatest magnitude, even when intensified by great wind-pressure carrying it directly against the doors. In compliance with these instructions, doors were manufactured by us for four distinct openings. The efficiency of these doors was fully proved in the disastrous fire which occurred in April 1884, on which occasion Messrs. Faudel & Phillips, and a number of architects and engineers, gave us very high testimonials. We have since the rebuilding supplied doors on the same principle, Mr. Wyatt Papworth, surveyor for the insurance company interested, having expressed his desire that these doors should be adopted.

Yours very truly,  
HOBBS, HART & CO.

76 & 77 Cheapside, E.C.

### ARCHÆOLOGY.

**Church Bells.**—The old bell belonging to Crosthwaite church, which was exhibited at the late Church Congress at Carlisle, has been restored to the church by Mr. R. Ferguson, M.P. The vicar has also purchased two superseded bells from Loweswater church, one of which is probably nearly six hundred years old. It has round its shoulder, in Lombardic capitals, one of which (S) is reversed, with a fleur-de-lis as initial stamp, and with nothing to indicate where a word begins or ends, the following inscription:—"Sanctamariaorapronobis." The Rev. Dr. Raven, of Great Yarmouth, to whom a rubbing of the inscription has been sent, says that he is "inclined to assign the early part of the fourteenth century as the date of the bell." Where or by whom it was cast has not been ascertained, for its letters, though Lombardic, and its maker's stamp are not identical with any letters or stamp hitherto recorded by campanologists. Dr. Raven says:—"I do not recognise the lettering. Everything has to be done for northern campanology, and I suspect some local foundry (probably at Carlisle) will turn up."

### CHURCH BUILDING AND RESTORATION.

**Marylebone.**—This church has been enlarged and remodelled under the direction of Mr. Thomas Harris, architect. The enlargement consists of a semicircular apse at the end of the nave and a new clergy vestry, with a strong-room attached. The whole of the upper tier of side galleries have been removed; the organ has been removed, and a chancel arch opening into the new apse has been formed, with various other works. The greatest difficulty, perhaps, which presented itself to the architect was how to bring the width of the nave into proportion with the new apse; but that difficulty has been overcome by the somewhat unusual disposition of the pierced screens built up to enclose the wings and form connecting links with the choir screen walls, thus producing a gradual lessening of the great width of the nave. The floor of the nave has been completely reseated with mahogany benches and repaved with Comblanchien and rouge royal marbles in chequers. The new screen walls are enriched with fluted Corinthian pilasters, and are pierced with openings into the wings. In the large arched openings on the left is placed the new organ—by Messrs. Gray and Davison—the front and screen of which are composed of mahogany and plain zinc pipes with a slight gilt scroll, while a somewhat similar screen occupies the largest arch on the opposite side. A Corinthian entablature is carried all round the church walls, a text being written over the choir; and the ceiling has been enriched with moulded ribs and other suitable decoration. The choir extends into the church as far as the position of the old communion rails, and is raised 12 inches above the level of the nave. It is enclosed by a screen wall panelled in rouge royal and alabaster, at one angle of which is placed the

pulpit formed by another tier of marble panelling. The floor is laid with marble mosaic, the choir stalls being of panelled and carved mahogany. The sacarium occupies the whole of the apse, and is raised two steps above the level of the choir, being separated from it by a marble balustrade. The chancel arch is supported by four marble columns, and the floor of the apse, like that of the choir, is paved with mosaic. There are two windows on either side of the reredos, which is enclosed in a repoussé frame of copper gilt, with marble backing and edges, and the walls are enriched by a marble entablature and pilasters. A plinth and sur-base of marble line the walls to a height of 5 feet from the floor, the space between the sur-base and the window-sills being filled with marble mosaics. Two very handsome brass gas standards, each bearing thirty-one lights, are placed on each side of the sacarium. The altar-table is of wood, with a mosaic frontal in a marble frame. The reredos embraces the whole of the middle bay, the front pilasters being carved in low relief, with arabesques symbolical of the Resurrection. All the mosaic work before mentioned portrays Scriptural subjects. In the dome of the sacarium is painted a "Majesty," Our Lord on a sapphire throne with a rich baldacchino occupying the centre bay, while on either side are angels and elders ranged in two ranks. The dome is continued round in other bays by an arcade of three arches in each bay. The windows of the apse are filled with painted glass, delineating five subjects connected with Christ's life on earth, and the subjects on the walls and in the windows of the nave are illustrative of the Law and the Gospel, six of the painted subjects between the nave windows being presented and painted by Mr. E. Armitage, R.A. In addition to the brass standards in the sacarium the church is lighted by a sun-light in the roof of the nave, standard lights on the choir stalls, and pendants under the galleries.

**Nottingham.**—On the 27th inst. the new church of Immanuel, Woodborough Road, was consecrated by the Bishop of Southwell. The site is elevated on a rocky platform, the adjoining road being on a steep declivity. At present the nave and aisles only have been erected, providing chairs for 600 people. The complete church is proposed to accommodate about 800. Coxbench stone with variegated courses has been used for the exterior, the interior showing a lining of red brick throughout; tiled roofs; timber of unvarnished pitch-pine. Messrs. Smith & Lunn, of Newark, have carried out the contract for the whole of the works. Mr. Fothergill Watson, of Nottingham, is the architect.

**Mistley.**—The chancel of St. Mary's church has been reopened after decoration. The roof of the chancel is divided into panels by curved ribs. The panels are richly gilded with various sacred emblems painted in a warm chocolate tint, while the ribs and cornice are coloured to match. The space beneath the windows is covered with a diapered pattern in olive green, surmounted by a broad gold band with text. The walls of the chancel above the string-course running under the windows are painted with a subdued red tint, and ornamented with conventional foliage. In the nave the space over the chancel arch is filled with angels, with instruments of music, rising towards the Lamb of God, encircled with the emblematical vesica over the crown of the arch. These are on a dull blue ground. The spandrel spaces between the arches are ornamented with twelve medallions figuring the twelve apostles, with appropriate emblem. The windows and arches, both in the nave and aisles, are enriched with ornaments, while the chocolate-coloured base which runs round the whole church gives richness and colour where most wanted. The work has been executed by Messrs. Simpson & Sons, St. Martin's Lane, from designs and under the direction of Messrs. Wadmore & Baker, architects, of London.

### NEW BUILDINGS.

**Hucknall, near Nottingham.**—The parish institute lately opened here, with a café, games-room, and reading-room, also with large lecture-room above, and smaller room adjoining on the same floor, has proved so far a great success in securing the attendance of the working-classes of the district. The building is constructed of Bulwell red bricks and Staffordshire tiled roofs, the leading feature of the exterior being the staircase turret. The lecture-room has an open-timbered roof. The works have been carried out at a cost of about 1,000*l.* by Messrs. Stainforth Brothers, of Hucknall. The architect is Mr. Fothergill Watson, of Nottingham.

**Gibraltar.**—The well-known firm of W. H. Lascelles & Co., of Bunhill Row, E.C., are about to erect a large building, comprising assembly-halls and masonic-rooms, at Gibraltar. The work will be carried out under the direction of the architect, Mr. C. H. Driver, 5 Victoria Street, Westminster.

**Wigan.**—A large drill-hall was recently opened in Powell Street, Wigan, by the Earl of Crawford and Balcarres,

Lieutenant-Colonel 4th L.R.V., who gave it as his opinion that the Wigan Volunteers now possessed one of the finest drill-halls in the country. The cost has been £3,300. Messrs. Isitt & Verity, of Bradford and Wigan, were the architects.

### GENERAL.

**Two Paintings** by Eugène Delacroix, viz., *Hamlet and the Gravedigger* and *The Tigers*, are to be added to the Louvre, together with two examples of *Décamps*.

**Mr. George Reid, R.S.A.**, has presented to the Aberdeen Art Gallery his large historical picture of *The Last Sleep of Savonarola on the Morning of His Execution*.

**A Roman Urn** has been discovered in the excavations for widening Connaught Road, Dover.

**The Fine Art Exhibition**, in Dundee, was the means of effecting the sale of pictures to the value of £3,206. Many of them were purchased by winners in the local art union.

**The Dublin Amateur and Artists' Society** will open the thirteenth annual exhibition of pictures to-day (Saturday). This year the works of members will be supplemented by a loan collection.

**M. Albert Goupil** has bequeathed a bust of Donatello to the Louvre, and some splendid examples of tapestry to the Gobelins.

**The Architectural Diploma** of the Ecole des Beaux-Arts was, after the late competition, granted to the following students:—MM. Authelain, Bergon, Besancenet, Boeswilwald, Gouvers, Guicestre, Nicolas, Pariset, Louvet, Leroy, Pied, Poucet, and Salleron. The subject of the test design was a ceramic museum, and the jury consisted of MM. Bailly, Questel, Andre, Guillaume, Lenoir, Ginain, Garnier, Guadet, Brune, Daumet, Pascal, de Baudot, Ribon, and Delacroix.

**The Kilmarnock Art Exhibition**, which was opened by the Duke of Portland on December 9, closed on Saturday evening. A sum of £2,600. has been realised by sale of pictures.

**The Eleventh Annual Exhibition of Suffolk Artists** was opened at Ipswich on Monday.

**A Winter Exhibition of Pictures** was opened at the Queen's Park Museum, Manchester, on Saturday last.

**The Parkes Museum** has received a number of interesting articles and models from the Japanese Section of the Health Exhibition.

**The Costume Ball** of the Royal Institute of Painters in Water-Colours is to be held in May. In consequence of the death of the Duke of Albany it was postponed last year.

**A Statue of Artemis** has been acquired by the museum of Vienna. It was found recently in Vienna, and is supposed to have been the work of a pupil of Praxiteles. Traces of colour are visible on the marble.

**An Exhibition of Historic Portraits** is to be opened in Paris during May of this year. The proceeds will be given to the support of a night asylum for women.

**M. G. de Neureuther**, architect, of Munich, was lately elected as Associate of the Brussels Academy of Fine Arts, in place of M. von Ferstel.

**M. E. Detaille** has been lately travelling in Russia, and will hang a few drawings from the North in the next water-colour exhibition of Paris. His friend, M. de Neuville, is also to show some fine drawings.

**The Bishop of Rochester** has during the past year consecrated eight churches in his diocese, and six churches have been reopened after extensive restoration and repair.

**The Leith Town Council** have lodged a memorial against the Edinburgh Extension and Sewerage Bill, on the ground that the standing orders have not been complied with.

**Mr. Robert Hutchison**, the Edinburgh Dean of Guild, died on the 23rd inst., in his sixty-fourth year. For many years he carried on an extensive business in Edinburgh as a builder. It was he who erected Craiglockhart Poorhouse, the Waverley Station, and on one occasion he rebuilt the Theatre Royal.

**M. Pierre-Joseph Vleriset**, the Belgian architect, died lately at Huy in his eighty-eighth year. He designed a great many of the principal country houses in the country.

**M. Amalle**, whose scene in the drama of "Théodora," representing the *Oratory of Justinian*, is nightly admired at the Porte St.-Martin Theatre, has become a partner of M. Robecchi, the decorator.

**Mr. Stirling Dyce**, son of the late Mr. Wm. Dyce, R.A., has offered to the Aberdeen Art Gallery portions of the cartoons of the frescoes painted by his father in the Houses of Parliament,

which comprised *The Baptism of St. Ethelbert* and five subjects from the Arthurean poems.

**The Municipality of Spezzia** propose to construct within three years a sufficient number of buildings to lodge a thousand families. Each building will be of three floors only, and will have a spacious internal quadrangle, which will be divided into four little gardens, each of one hundred mètres square.

**Mr. James Bell**, who was for many years the engineer-in-chief to the North British Railway Company, died on the 21st inst.

**Mr. Augustus W. Tanner**, District Surveyor of Hatcham of the firm of Romaine-Walker & Tanner, architects, has been appointed by the Metropolitan Board of Works to act as temporary substitute in the district of St. Nicholas, Deptford, and the portion of St. Paul in Kent, rendered vacant by the death of Mr. John Whichcord, F.S.A., and past President of the Royal Institute of British Architects.

**A New Loan** is expected to be offered shortly by the City of Paris for public works, which have been long projected, and which are to be undertaken in order to give occupation to the unemployed working-classes. The sum demanded will not be less than 200 millions of francs. No loan has been raised by the municipality since 1876.

**Subscriptions** amounting to upwards of 5,000. have been raised for the erection of the Gilfillan Memorial Church, in Dundee. A central site is being purchased in Ward Road, and it is expected that as soon as the ground is clear building will commence.

**Messrs. Sommerville & Co.**, of the Caledonian Saw Mills Bogston, are about to claim from the Glasgow and South-Western Railway Company between 50,000. and 60,000., owing to the company's operations in connection with the James Watt Dock interfering with their business.

**The Carron Iron Company** intend to offer rewards to their workmen who are able to suggest improvements by which the work of the company will be rendered superior in quality or more economical in cost.

**An Engineering Inspectorship** under the Local Government Board has become vacant by the death of Captain R. Hildyard, R.E. The appointment is worth 800. a year.

**The Bridge House Estates Committee** are to submit twelve subjects for equestrian figures to the Court of Common Council, from which four will be selected for the statuary on Blackfriars Bridge. A limited competition among twelve sculptors will be afterwards instituted.

**The Chairman** of the Finance Committee of the London School Board stated, at a meeting on Tuesday night, that he should at the next meeting of the Board have to ask for a sum little short of 800,000., and that the expenditure must go on increasing.

**The Aberdeen Town Council** on Monday resolved to proceed with the construction of a line of railway along the quay to the gasworks, for the conveyance of coal, at an estimated cost of 6,760.

**Captain Abney, R.E.**, has been appointed Assistant Director for Science under the Science and Art Department. He is known from his experiments and writings on photography.

**Mr. Charles Kirk**, architect, of Sleaford, has reported that the tower and spire of Sleaford church, struck by lightning last autumn, is so damaged as to be liable to fall at any time. Mr. J. L. Pearson, R.A., who was subsequently called in, has confirmed Mr. Kirk's report. The cost of taking down and rebuilding the tower and spire is estimated at 2,500.

**The Committee of the Sheffield Technical School** have recommended the purchase of the grammar school buildings, with a view of their adaptation to the purposes of the technical school.

**Mr. W. H. Brockbank**, assistant borough surveyor of Bolton, has been appointed to the borough surveyorship of Bolton, in place of Mr. Proctor, resigned. There were seventy-two candidates for the post.

**Mr. Ellice Clark, C.E.**, has been appointed county surveyor of Sussex. Mr. Ellice Clark still retains his appointment of surveyor to the Commissioners of Hove.

**Plans** have been prepared by Mr. W. L. Osborne, architect, for the extension of St. Paul's church, Ramsgate.

**Mr. John O. Scott** has been called in to examine and report on the fabric of St. Chad's church, Lichfield, which is in need of restoration.

**Mr. Ashworth**, architect, of Exeter, has reported on the state of St. Sidwell's church tower. It is proposed to take steps to remove such portion of spire and pinnacles as is in a dangerous condition, pending the consideration of more extensive improvements proposed.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, JANUARY 31, 1885.

## A BANK STRONG ROOM.

THE offices of the National Bank of Scotland, Edinburgh, are being enlarged, from plans by Mr. M'Lachlan. The block measures about 87 feet in length by about 37 feet in breadth, the height from the pavement being about 40 feet. The structure, when completed, will form the envelope of what will be, it is understood, the strongest safe-room of any bank in Scotland. The principal strong-room is 50 feet long, 12 feet wide, and 10 feet high. All round this compartment, on both flats, there will be an ambulatory or walk for the night watchman. The walls of the under floor or plate safe will be 3 feet thick, formed of an outer and an inner coating of glazed fire-brick, the space between filled with 15 inches of cement concrete. The floor will be of concrete 2 feet thick, with a strong iron grid of  $1\frac{1}{4}$ -inch bars, set not further apart than 5 inches. The walls of the upper safe, which is to be used for the custody of cash, securities, &c., will be similarly constructed, excepting that there will be added to them, as well as to the floor and ceiling of the chamber, an inside lining of undrillable metal,  $1\frac{1}{4}$  inch thick. The iron lining of the main safe will weigh about 80 tons. The construction of the strong-room was entrusted to Messrs. Chubb & Sons, 128 Queen Victoria Street, London. To the north of this part of the building there will be two smaller safes, one on each flat, for books, &c., and in the middle flat, towards the back, accommodation has been provided for the burning of notes, when necessary, by the directors of the bank. The upper floor of the building will be reached by a staircase immediately behind the telling-room, and will contain offices for the accountant and the inspector of branches.

## WOOD PAVEMENT.

THE ancient parish church of St. Michael, Macclesfield, which has for some considerable time been undergoing restoration, was reopened on January 7. The old flooring has been taken out, and a foundation of concrete put in, on which a wood-block flooring has been laid by Messrs. Geary & Walker, of 7 John Dalton Street, Manchester, on their patent principle. The blocks are bedded in an adhesive and preservative compound, and "keyed" to the underlying cement-floated bed, this being the distinguishing feature of Messrs. Geary & Walker's patent. The architect for the restoration was Mr. James Stevens, F.R.I.B.A., of Manchester and Macclesfield, the builder being Mr. H. S. Aspinwall, of Macclesfield.

## A LADDER ACCIDENT.

THE case of Hotzner v. Gregory was tried at Croydon on Saturday last by Mr. Justice Manisty, which has interest for builders. Mrs. Hotzner was passing along Battersea Park Road in September last, and was knocked down by the fall of a ladder set up against a house by a working

painter in the employment of the defendant. The ladder fell on her shoulder first and knocked her down, and, falling on her leg, broke it in three places just above the ankle. She was carried home, and was two months confined to her bed, and can only now hobble with her stick. The defence set up was that the lady had clutched the ladder as she passed, and pulled it down upon her. The learned Judge, however, did not adopt this view, and observed that the lady was picked up with the top of the ladder close to her shoulders, and it was 15 feet long. He gave a verdict for the plaintiff for 60*l.* damages.

## "HARD LINES."

A NEW GAME, called "Hard Lines," has just been introduced by Messrs. George Wright & Co., of Westminster Bridge Road, the patentees of the "Combined Billiard and Dining Table." This invention, which deserves and promises to obtain a wide popularity, supplies a thoroughly interesting and scientific indoor game. The "Hard Lines" board is almost identical in size and shape with bagatelle, but has the advantage of being *purely a game of skill*, moreover, as several games can be played on the board, including an excellent pool. It is free from the monotony which is noticeable in the older game. Although fluking is impossible at "Hard Lines," the game is quite within the capacity of all, and while in a simple form it can be played even by children, it can also be so played as to tax the resources of the most experienced hand at billiards, for which game it also affords the best possible practice to those who have not the convenience of a billiard-table at home.

## VENTILATION OF PUBLIC BUILDINGS.

MESSRS. ROBERT BOYLE & SON, 64 Holborn Viaduct, and Glasgow, are at present applying, and have applied, their self-acting air-pump ventilators and system of ventilation to New Residential Chambers, Park Lane, under the direction of Mr. Alfred Waterhouse, A.R.A.; small-pox ship *Endymion*, Longreach, under the direction of the Metropolitan Asylums Board; new Shoe Factory, Starch Green, under the direction of Messrs. T. Chatfield Clark & Son; London Salvage Corps Station, Commercial Road; New Conference Hall, Stratford, E; Victoria Central Electric Light Station, S.W.; New Hospital, Llandudno; Sanitary Hospital, Bournemouth; New Bodega, Birmingham; Liberal Club, Colchester; Female Penitentiary, Stoke Newington; and to the residences of the following noblemen and gentlemen:—Duke of Westminster, Bishop of Bristol, Earl of Northbrook, Earl of Breadalbane, Earl of Kenmare, Earl of Shrewsbury, Earl of Coventry, Earl of Cawdor, Sir Thomas Brassey, Sir Philip Rose, Sir Henry Elliott, Sir Frederick Leighton, Sir William Foster, Sir William Humphry, Sir Richard Bulkeley, Sir James Ramsden, Sir John St. Aubyn, Sir Charles Trevelyan, and Sir Charles Brooke.

## STATUE OF SIR HUSSEY VIVIAN.

THE statue of Sir Hussey Vivian, M.P., modelled by Signor Raggi, will, in the course of two or three weeks, be cast in bronze at the works of Messrs. Young & Co., Pimlico. The statue represents the baronet in a standing position, and is artistically portrayed. When finished it will be erected at Swansea.

## COMPETITIONS OPEN.

CHELSEA.—Feb. 25.—Plans are invited for Additions to the Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, Clerk of the Vestry, King's Road, Chelsea.

CROYDON.—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100*l.*, 30*l.*, and 25*l.* for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

LONGTON.—Feb. 20.—The Longton School Board are about to erect two sets of schools at Normacott and Florence, each to accommodate 700 scholars (220 boys, 220 girls, and 260 infants), and invite architects in the Potteries and Newcastle to send in designs and estimates. Mr. Geo. C. Kent, Clerk to the School Board, Longton.

WINDSOR.—Feb. 28.—The Town Council of New Windsor invite designs for a panel of tapestry to be fixed in the Guildhall. Three prize-winners will be invited to compete for the cartoon from which the panel of tapestry will be woven. The Town Clerk, 4 Park Street, Windsor. Competitors must be resident within five miles of the Guildhall, Windsor.

## CONTRACTS OPEN.

ABERYSTWYTH.—Jan. 31.—For Building House at Brongog. Mr. J. Middleton, Architect, Cheltenham.

ARBROATH.—Feb. 2.—For Reconstruction of Entrance to Wet Dock. Mr. W. D. Cay, C.E., 107A Princes Street, Edinburgh.

AYR.—Feb. 10.—For Supplying and Fixing Gasholder. Mr. W. Smith, Manager, Gasworks, Ayr.

BANGOR.—Feb. 4.—For Building Villa. Mr. Owen Williams, Architect, Bangor.

BEDFORD.—Feb. 24.—For Plans and Specifications and Execution of Works in connection with Sewage Pumping at Outfall Works. Mr. J. Lund, Borough Surveyor, Corn Exchange, Bedford.

BEDWELTY.—Feb. 3.—For Building Cemetery Chapel, Caretaker's House, Boundary Walls, &c. Mr. G. A. Lundie, 14 The Parade, Tredegarville, Cardiff.

BEESTON.—Feb. 5.—For Building Mortuary Chapel, Boundary Walls, Entrance Gates, &c., Wollaton Road. Mr. Herbert Walker, Architect, Newcastle Chambers, Angel Row, Nottingham.

**BERMONDSEY.**—Feb. 6.—For Fitting-up, &c., of Machinery and Engineers' Work in Alterations and Additions to Baths and Washhouses, Spa Road. Messrs. George Elkington & Son, Architects, 95 Cannon Street, E.C.

**BETHNAL GREEN.**—Feb. 5.—For Construction of Brick Sewers in Queen's Road, Great Cambridge Street, &c., to Bethnal Green Road. The Engineer, Metropolitan Board of Works, Spring Gardens, S.W.

**BIRKENHEAD.**—Feb. 5.—For Supplying and Fixing Two Pumping-engines, with Pumps and Steam Boiler at Spring Hill Water Works, Ball's Road. Mr. W. A. Richardson, Water Engineer, 50 Hamilton Square, Birkenhead.

**BISHOP'S STORTFORD.**—Feb. 3.—For Construction of Concrete Gasholder Tank. Mr. H. E. Jones, C.E., Gasworks, Harford Street, Stepney.

**BLACKBURN.**—Feb. 9.—For Construction of Station. The Engineer, Hunt's Bank, Manchester.

**BLACKROCK.**—Jan. 31.—For Construction of Disinfecting Hot-air Chamber. Mr. T. M. Porter, Secretary to the Commissioners, Town Hall, Blackrock, Dublin.

**BOLTON.**—Feb. 9.—For Building Goods Warehouse. The Engineer, Hunt's Bank, Manchester.

**BRADFORD.**—Feb. 9.—For Building Sunday Schools at St. Mark's Church, Manningham. Messrs. Morley & Woodhouse, Architects, 15 Darley Street, Bradford.

**BURSLER.**—Jan. 31.—For Building the Haywood Hospital. Mr. George B. Ford, Architect, Burslem.

**BUSLINGTHORPE.**—Jan. 31.—For Restoration of Drying-sheds at Hill Top Leather Works. Messrs. Wilson & Bailey, Architects, 35 Park Square, Leeds.

**CANTERBURY.**—Feb. 11.—For Building Engine and Boiler-houses, Chimney Shaft, and other Works, Barton Mills. Mr. John G. Hall, Architect, 4 St. Margaret's Street, Canterbury.

**CARDIFF.**—Feb. 9.—For Building Workshops, Offices, &c., and for Construction of Gridiron

and Berth for Offshore Floating Dock and Sea Wall. Mr. H. W. Butler, C.E., 35 West Bute Street, Cardiff.

**CARLISLE.**—Feb. 2.—For Building Hotel, Lowther Street. Mr. James Leslie, Architect, 27A English Street, Carlisle.

**CHARLTON.**—Feb. 4.—For Construction of Urinal. Mr. G. Whale, Clerk to the Plumstead District Board of Works, Old Charlton, S.E.

**CHELSEA.**—Feb. 3.—For Pulling Down large Hall in rear of Vestry Offices. Mr. J. Risdell Salway, Vestry Clerk, King's Road, Chelsea.

**CHESHIRE LINES.**—Feb. 3.—For Supply of 1,500 tons Bessemer Steel Rails. Mr. W. G. Scott, C.E., Central Station, Liverpool.

**CREWE.**—Feb. 6.—For Supplying and Laying Cast-iron Water Mains with Valves, Hydrants, Fittings, &c., in connection with the Water Supply. Mr. J. Aldersey Davenport, Surveyor, 152 Hospital Street, Nantwich.

**CROYDON.**—Feb. 9.—For Making Roads and Paths, Asphalted Yards, &c., at New Infirmary. Plan and Specification, by Messrs. Berney and Monday, Architects, at the Infirmary, Mayday Road, Croydon.

**DAGENHAM.**—Feb. 4.—For Building School and Teacher's Residence at Hainault. Mr. John Hudson, Architect, 80 Leman Street, Whitechapel.

**DANISH STATE RAILWAYS.**—Feb. 4.—For Supply and Delivery of 70 tons of Tires for Locomotive and Wagon Wheels. Otto Busse, Chief Mechanical Engineer, Aarhus, in Denmark.

**DARLINGTON.**—Feb. 18.—For the Works in Building Central Passenger Station, including Platforms, Roofing, &c. Mr. William Bell, Architect to the North-Eastern Railway Company, York.

**DEWSBURY.**—Feb. 6.—For Building Butcher's Shop, Reading Rooms, and House, for the Dewsbury Pioneer Industrial Society. Mr. Henry Holtom, Architect, Bond Street, Dewsbury.

**DUNDALK.**—Feb. 14.—For Supplying the Clogher Valley Tramway Company (Limited) with 3,000 tons of 45-lb. Steel Rails (ordinary

flat-foot railway form), with Fishes and Washers, and 90,000 Baltic Sleepers, 6 feet by 8 inches, creosoted. Messrs. Barton, Company's Engineers, Exchange Buildings, Dundalk.

**EBBW VALE.**—For Building Master's House for the Bedwelty School Board at Briery Hill. Mr. C. Dauncy, Clerk to the School Board, Tredegar.

**EDGCUMB.**—Feb. 6.—For Building Wesleyan Chapel, School-rooms, and Vestry. Mr. Silvanus Trevel, Architect, Truro.

**EDINBURGH.**—Feb. 6.—For Building Church Manse at Ladybank. Mr. James Campbell Walker, Architect, 2 N.-E. Circus Place, Edinburgh.

**ELGIN.**—Feb. 7.—For Additions to various Farm Buildings. Messrs. M'Bey & Gordon, Surveyors, Elgin.

**ELTON.**—Feb. 3.—For Ironwork for Fire-proofing Mill. Mr. J. H. Wood, Architect, Castle Chambers, Bury.

**EYEMOUTH.**—Jan. 31.—For Cutting Track, Laying Pipes, &c., for Addition to Water Supply. Mr. J. Donaldson, Clerk to the Police Commissioners, Eyemouth.

**FARNWORTH.**—Feb. 19.—For Construction of Bridge. Mr. W. Radford, 1 Princess Street, Manchester.

**FERRYHILL.**—Feb. 7.—For Building Superintendent's House, Porch, Boundary Walls, &c., and for Draining and Laying out Cemetery. Mr. Robert W. Thompson, Architect, Bishop Auckland.

**FORGNEY.**—Feb. 10.—For Alterations to School-house for Conversion into Glebe House. Mr. C. A. Owen, Architect, Molesworth Street, Dublin.

**GENERAL POST OFFICE.**—Feb. 12.—For Laying and Working Telegraph Cable to the West Coast of Africa from St. Vincent, Cape Verde Islands. The Secretary, General Post Office, E.C.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

## SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

### INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c. JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy." "Baptist Chapel, Clapham; J. AMMON, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public."

"Mr. John Grundy." From Hon. and Rev. G. G. C. Talbot, M.A., Withington Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen."

"Mr. John Grundy." From F. J. Yates, Esq., Architect, Birmingham. "The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. p. cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## PATENT WROUGHT STEEL NAILS. OVAL WIRE NAILS.

Ask your Factor or Ironmonger for  
"MITRE NAILS."

WHOLESALE AND EXPORT ONLY.

For Heating New Business Premises, Chenies Street, W.C.

J. L. BACON & Co., London (accepted).

**BELLMAN'S PATENT GULLY.**

This Gully possesses the following advantages:—

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

**ART PLATES FROM "THE ARCHITECT."**

Proof Impressions of the following Illustration which has appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

**The Bard.**

**FACSIMILE OF CARTOON BY PROFESSOR MAILLART.**

## VENETIAN ENAMEL MOSAIC

FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

A. CAPPELLO, 472 KING'S ROAD, CHELSEA, LONDON, S.W. Established in 1880. 15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per square ft. Venetian Enamel Mosaic Figure Work at 20s. per square ft., including expenses of Fixing.

## MOSAIC PAVEMENTS.

YOCKNEY & CO., Quarry Owners. Prices quoted on application for Delivery at any Port or Railway Station, for all varieties of BATH STONE, { Selected specially to suit Architects' Specifications and Builders' use. Address—YOCKNEY & CO., Corsham Down Quarry, Wilts.

**BUILDING TRADES AND GENERAL  
MANUFACTURERS' EXHIBITION AT  
LEEDS.**

ON Saturday, the 17th inst., an exhibition embodying the above characteristics was opened in the Coloured Cloth Hall, Leeds, and is decidedly the best one of its kind that we have seen in the provinces. From his close connection with exhibitions held at the Agricultural Hall, and particularly with the annual building trades' display, Mr. Philip Shrapnel makes an admirable manager, and, as every year adds to the confidence that exhibitors repose in him, we may reasonably hope to see each one that is "built up," so to speak, under his guidance, an improvement on its predecessor. Leeds and its district are well represented, both in the heavy class of machinery for which she enjoys a well-earned reputation, as well as in the lighter and more ornamental articles required in the dwelling-house, which includes cabinet furniture, blinds, school furniture, grates and ranges, &c. We select the following from amongst the general exhibits, as possessing the greatest amount of interest to our readers.

Messrs. C. KITE & Co., Christopher Works, 117 Chalton Street, N.W., are present with models and full-sized specimens of their different ventilators and system of ventilation as applied to an entire building, or in the case of drains to an entire row or street. Having been awarded the gold medal for their exhaust ventilator, and a silver for the drain ventilator at the late Healtheries Exhibition, they now stand in the front rank as regards awards. A meed of praise is certainly due to them for the attractive and ingenious modes in which they have disguised the presence of inlet ventilators. Thus a mirror, a charming little cabinet, and kindred ornamental adjuncts have been so cunningly devised, that although to all appearance they are simply what they profess to be, they are all the while discharging fresh air into the apartment from the outer atmosphere "unseen and unheard." We are justified in say-

ing as much in favour of their chimney-breast ventilator, large numbers of which are now in use, specified for by some of the most noted architects, and scarcely known to fail in the slightest degree.

Of local firms as ventilating engineers, Mr. JAMES EDWARD ELLISON, Victoria Square, Leeds, contributes a very attractive stand, artistically built up of his various ventilating appliances. Amongst these are to be found his well-known "Radiator" ventilator, and conical perforated bricks and air-grates; Stevens' patent exhaust, turret, and soil-pipe ventilators, of which he is now the maker; and the exhibit is further supplemented by a collection of Cooper's glass louvre ventilators, smoke-testing machine for drains, fumigating, &c. (Baird, Thompson & Co.'s patent).

Earth closets are represented by MOULE'S PATENT EARTH CLOSET COMPANY, Limited, Garrick Street, Covent Garden, who again at the Healtheries carried off the palm (gold medal) from all competitors. The extensive ramifications of this company, the superiority of their manufactures, and the well-known abilities of their engineer, have placed them in a very advanced position in this increasing industry.

The HOPTON WOOD STONE COMPANY, Wirksworth, show some fine examples of their celebrated Yorkshire stone. There is an excellent specimen in the form of a chimney-piece, in what they term their wood stone. The samples of fossil marble and other specimens of wood stone are highly interesting, and point to the varied purposes to which the contents of the Hopton Wood quarries may be made available. There is also to be seen a collection of paving setts, cubes, and chisel-dressed kerbings, all of which are extensively used in the northern district as well as other parts of the country.

Another firm of note in this part of the kingdom showing Yorkshire stone is Messrs. THOMAS WOOD & Co., of the Spinkwell Quarries, Bradford. The principal feature in this stone is its purity of colour and evenness of texture, which causes it to rank amongst the very best emanating from the county. The quality of the

material is seen in a thoroughly finished monumental cross exhibited here, though perhaps to the untechnical observer the Spinkwell stone would show to better advantage in a properly worked than ornamental state, as it appears in the example named.

Horticultural work is exhibited by the noted North of England firm, Messrs. W. RICHARDSON & Co., of Darlington. They show a very useful and inexpensive improved portable span garden-frame, 8 feet long by 6 feet wide, easily fixed, and as readily taken to pieces. There are also samples of their glazed wall tree protectors, of different widths, to which the foregoing remarks also apply, and they exhibit a variety of well-made models of horticultural buildings, showing their patent system of ventilation. Their Parisian greenhouse blinds, made of wood and zinc, will be found excellent adjuncts to any conservatory. They show in addition several boilers possessing great heating power, one of these being their patent hooded tubular boiler, with a heating power of 850 feet of 4-inch piping. The display is supplemented with a collection of hot-water valves and fittings.

Mr. R. ADAMS, of Blackman Street, Borough, is present with his usual collection of fanlight openers, safety windows, and the numerous *bric-à-bracs* connected with windows and doors, for which he has become famous, and that we have called attention to on many occasions. There are two new features shown here for the first time, one of which in particular is ingenious, and will no doubt be extensively adopted. It is a new spring hinge, named the "Victor," for double-action doors, composed of two strong coils, capable of resisting hurricanes, however exposed the situation; and should the wind be blowing in an opposite direction to that for which the one spring is set, they can be reversed in a few seconds by any unpractical person with the assistance of a bradawl or any similar tool, and they can be adjusted to the greatest nicety, to compensate for wear, so as to adjust the door to its true centre position. The strength of the springs of the "Victor" is greatest when the door is closed, and diminishes with a pleasant easy motion as it is opened

# "THE BANQUET."

Owing to the great and continuous demand for

"The Banquet,"

BY

HENRY STACY MARKS, ESQ., R.A.,

This elegant and artistic Chromo-lithograph (size 39 inches by 15 inches) has been reprinted, and can now be had at the

OFFICE: 175 STRAND, LONDON, W.C.

PRICE ONE SHILLING; OR BY POST, 1s. 3d.

Now ready,

VOLUME XXXII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.

Office: 175 Strand, London, W.C.

When this hinge is kept properly oiled, the door will close with perfect silence; and a further advantage claimed for it is that, when repairs are needed, it can be done on the premises, and without taking down the door. An improvement is also shown in his patent fanlight opener, by which the mode of fixing is simplified, and is effected without cutting away the smallest piece of woodwork, all the parts being made to be screwed on instead of being let into the frame.

Messrs. HODKINSON & CLARK, Limited, Canada Works, Small Heath, Birmingham, make an imposing display of their well-known specialities, which have been so often mentioned in these columns that detailed recapitulation is not needed on this occasion. Manufacturers of school furniture will find they have now to do battle with this enterprising Birmingham firm in addition to their other competitors. Messrs. Hodkinson & Clark have thrown a *verve* into this branch of their manufactures since they commenced it, highly creditable to themselves and pleasing to those who have to use the appliances, and their improvements show, amongst other things, how much can be effected at a small additional cost, where a little taste is exercised. A schoolroom should be made as pleasing in its surroundings as possible, with, of course, a due regard to economy, and this has evidently been a point of study with the firm. Besides the display of school furniture and appliances, the exhibit contains a varied assortment of the firm's stained-glass windows, blinds, revolving-shutters, and "lights" of different character.

A good collection of wood-working machinery is shown by Messrs. WILSON BROS., Victoria Road, Leeds, a firm who have secured considerable reputation for the superiority of their work. There are several specimens of combined circular and band-sawing machines and circular saw benches for both hand and power suitable for different trades, including a very useful band-saw, for fixing to a bench or post, that will cut straight or in a curve up to 6 inches thick. The Leeds Improved Circular

Saw Bench is also worthy of remark. Twenty-four inches long, it is fitted with a rising and falling spindle running in long gun-metal adjustable bearings, that are raised and lowered by a screw and hand-wheel, for purpose of ripping, cross-cutting, rabbeting, tenoning, grooving, &c. It is a very substantial machine, the frame being cast in one piece. The Leeds Improved Band-sawing Machine is no less notable. The wheels are of wrought-iron, made on the "Ariel" or bicycle pattern, which secures strength with lightness, and a better appearance than the heavy-looking cast wheels generally attached to them. The desire of the makers has also been to prevent the breakage of the saws, and this is to a great extent obviated by facing the wheels with indiarubber, which secures greater flexibility than leather. There are several points in this machine of decided advantage, which space prevents our noticing, but which may be known by writing for the firm's circular. A new centre-motion mortising, boring, and tenoning machine is also exhibited, which secures a greatly increased power, and reduces the wear and tear usual upon the side-crank pinion wheels and toggle movement. There are several other machines of merit on this stand well worth the attention of the building trade.

Mr. JOSEPH SHAW LOCKWOOD, Huddersfield, shows Milan & Shaw's patent indicator for the prevention of household boiler explosions and indicating the water supply, a well-devised and useful addenda to the kitchen range where high-pressure boilers are in use; Shaw's patent Universal Union Joint, an ingenious invention that has secured a large sale; and other useful inventions.

Wood-working machinery, of good quality, is exhibited by JOSEPH GREEN & NEPHEW, of the Globe Point Ironworks, Crown Point Road, Leeds, and in connection with this exhibit Mr. ROBERT STEEL provides a  $3\frac{1}{2}$  horse-power gas-engine, with some commendable features for driving the machines.

Messrs. J. SAGAR & Co., Well Lane, Halifax, also show some excellent wood-working

machinery, a prominent feature being their "Premier" hand and power feed planing and thicknessing machine, which effects a large amount of different classes of work, including chamfering, bevelling, surfacing, straight or taper-work, &c., at varying speeds, and one of Steel's gas-engines is also employed at this stand.

Mr. WM. JOHNSON, Queen's Road, Leeds, sends his patent lever steam brick-pressing machine, which is capable of turning out 10,000 semi-plastic bricks per day ready for the kiln, from any grindable clay or marl. It can also be used for pressing peat, patent fuel, &c., and appears to be a most reliable piece of machinery.

Stone-breaking machinery is exhibited by Mr. H. R. MARSDEN, of Leeds, whose apparatus has been before the public for many years, and has proved of great value to those requiring such appliances, Messrs. W. H. BAXTER & Co., of Leeds, contributing a similar machine with a knapping motion, that has also secured a large amount of patronage.

The well-known firm of SAMUEL DENISON & SON, of Leeds, contribute a commendable collection of weighing machinery suitable for different trades, a prominent feature being their suspended machine weighing up to ten tons, made without springs, employing no liquids or loose weights. This is an admirable appliance, strictly accurate, and has secured a large amount of patronage.

Mr. WILLIAM COURT, of Court Street, Carlisle, exhibits a new invention in block flooring that we believe is destined to supersede ordinary parquetry to a large extent. Every kind of design applicable to parquetry can be carried out by this invention, each block being cut by machinery with a dovetailed tongue underneath, so that when laid in composition it is impossible to loosen or lift it. As we purpose giving illustrations of this invention at a future date, we defer more detailed remarks for the present.

Messrs. DOULTON & Co., of Lambeth, are present with a selection of their most recently

# RICHARDSON'S HORTICULTURAL BUILDINGS.

Erected in any part of the Kingdom with Hot Water Heating Apparatus, &c., complete.

ARCHITECTS' DESIGNS FOR CONSERVATORIES, &c.

Carried out with great care, correct in detail, and with the latest improvements in Construction.

Sole Agents in Great Britain for the Parisian Blinds for Greenhouses, so largely used on the Continent. They are made of Wood and Zinc only.

NORTH OF ENGLAND HORTICULTURAL WORKS—

**DARLINGTON.**

introduced sanitary appliances, Doulton ware, &c., of similar character (though on a smaller scale) to those exhibited at the late Health Exhibition, and that were fully described in the columns of *The Architect* on that occasion.

The AIRESIDE HEMATITE IRON COMPANY, Leeds, show a good collection of concrete of a most multifarious character, showing that they are by no means behind any of their competitors in the manufacture of this useful material; in fact they may fairly be said to be in advance in some features, a dado, with red ornamental panel, and other specimens of ornamental concrete, having elicited general approbation.

Messrs. ILLINGWORTH, INGHAM & Co., of Leeds, make a large display of school furniture of improved design, strong, well made, and looking fit for hard work. The exhibit is supplemented with a variety of machine-made wood mouldings, wood turnery, Swedish doors, &c. This firm have extensive ramifications and several branch establishments, enabling them to turn out an immense quantity of work in a short time.

Messrs. VERITY BROTHERS, of Call Lane, Leeds, whose inventions in connection with window-openers, skylight-lifters, and reversible sash-windows are well known to the profession and building trade, are present with their several appliances, amongst which we notice a new reversible sash-window that must secure the approbation of all who see it. Although strong, it is of the most simple character as regards its attachments. The pivot is carried through the framework of the window, thus securing great strength. We have always been of opinion that too much strength could scarcely be employed in this part, and when it is remembered that the sash is dependent on these two pinions for its fixity, this much will be admitted. The breakage of one of these would in all probability cause the sash to fall into the street, and probably with results of a most distressing character. Another new invention shown by Messrs. Verity Brothers is a blind action of the most simple and effective character.

Messrs. A. ATTWOOD & Co., successors to Messrs. Salmon, Barnes & Co., of Ulverston, have sent their several specialities in lifts, containing their patent self-sustaining gear, revolving shutters, &c., with which the readers of *The Architect* are generally conversant.

Messrs. H. THOMPSON & Co., Merrow Street, Walworth, show their noted magnetic iron oxide paint, for which a gold medal was awarded them at the late Healtheries. These paints are suitable alike for all materials, whether wood, iron, stone, or brick. They possess great tenacity of incorporation with the substance they are set to cover, and do not scale. Examples of their damp proof wall-paint are also shown, water being unable to penetrate it.

Messrs. CORDINGLEY & SONS, Thorncliffe, Bradford, exhibit a variety of specimens of their patent fibrous plaster, concrete granite faced, and a new decorative material that they have named Parianetic, from its similarity in appearance to Parian china. The exhibit is especially noteworthy for the excellence and varied character of the designs in fibrous plaster, which cover a wide range, including pilasters in the Queen Anne and "Adam" style, enriched cornices, over-mantels, consoles, full-sized statues, &c., the new Parianetic having that beautiful dull gloss appertaining to real Parian. The granite-faced concrete is no less commendable, and is in large demand, the customers of the firm including the War Department, Board of Works, and other public bodies, who have testified to its great strength and universal adaptability.

Messrs. KAYLL & Co., Aire Street, Leeds, add to the artistic appearance of the exhibition by their choice display of painted and stained glass, the examples being of a very meritorious character. One of the principal exhibits is a panel representing the arts and sciences, designed and carried out by the firm for the new Technical College at Bradford. Two other panels of equal merit have been made for a private mansion in the neighbourhood of Leeds. There are several specimens of windows in rolled cathedral and antique glass, and also muffled glass in attractive kind for leaded work.

A variety of casements in stained glass, suitable for ecclesiastical purposes, including the hopper, fall-back hopper, pivot casement, &c., lend an additional attractiveness to the exhibit, which in addition comprises samples of glass of various thicknesses and colours, as well as brilliant cut-glass. This firm hold a high reputation in their art, and we understand have recently been obliged to increase their staff of artists, lead glaziers, &c., from the number of orders on hand.

The HARDING VENTILATOR COMPANY, East Parade, Leeds, exhibit their principle of ventilating buildings without draught by means of their patent air-diffusers, of which we append some examples. This mode of ventilation has been very extensively adopted in the midland and northern counties in both public and private buildings for the last four or five years, and has given general satisfaction, though as yet it does not appear to have been brought prominently into notice in the metropolis. For an ordinary apartment the Air-Diffuser consists of a small projecting box, as shown in our sectional engraving. It has a semi-pyramidal top, perforated with small tubes of wood, set in rows, on the three triangular faces of which the upper part is composed. Below the triangular part is a small box or cabinet, supported on brackets, and contains a door for the insertion of a filter, composed of a very fine silk gauze, such as is used in the milling trade for passing flour through, and which frees the incoming air from dust and other impurities. The apparatus being fixed against the wall, communication is made with the outer atmosphere, as shown in the illustration, and the air entering through the aperture first passes through the filter and then into the room through the small tubes, which are placed at an angle of about 30 degs. with the wall. The apparatus is fixed at about 7 feet 6 inches from the floor level. When passing through the tubes the currents of air are necessarily compressed, but immediately they are released they again expand, and diffuse themselves in all directions, so that all draught is counteracted. It is almost

# THE "HARDING" VENTILATING COMPANY,

## HARDINGS' PATENT AIR DIFFUSER FOR VENTILATING ALL KINDS OF BUILDINGS.

Diffuser with Filter.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required. Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

unnecessary to add that the diffuser can be made in any style, so long as the pyramidal form is retained at the top, and may even form a receptacle for holding ornaments. For instance, Messrs. Harding received orders from

the Dean of York to ventilate Archbishop Zouche's Chapel in York Minster, and for this a special design was made, in which the trefoil and the angular form were combined, the success, both as regards design and ventilation, being so perfect as to call for the highest encomiums from the Dean. From what we have seen of the Harding Air Diffuser we feel bound to speak of it in the highest terms, and we may add that it is generally accompanied by a simple valve, by which the amount of incoming fresh air can be regulated at will. The addition of the filter, and particularly of one of the material employed by the Messrs. Harding, is of the greatest value; for we have only to look at any

wall where an inlet ventilator is fixed that does not possess a filtering medium to see how soon it becomes discoloured. For the extraction of vitiated air in an ordinary apartment the open fire-grate will often be found sufficient, but any improved form of outlet ventilator may be used if necessary, and in a large building containing a sunlight there would be no need of any other appliance; but we call attention to Messrs. Harding's air extractor below. Another form in which the Harding ventilator has been found of great service is in our next illustration, de-

signed for a church window. Here the tubes are composed entirely of glass, but, it will be observed, the pyramidal form, which is one of the salient features in the Harding system, is still retained. The fresh air is admitted here at the outside bottom. We now give an illustration of the firm's patent air extractor, which is a fixed appliance of simple construction, and very inexpensive. It consists of two perforated cones and a central tube. The air impinging

upon them becomes deflected, creating an induced upward current in the tube, and the small inner cone acts as a deterrent to the admission of rain, snow, &c., which cannot possibly

enter. These extractors can be placed within an ornamental turret, which does not affect their action in the least. Taking the Harding system of ventilation in its entirety it presents meritorious features, and we cannot but think that if introduced into London, as we believe is now contemplated by the proprietors, it will secure a large amount of patronage.

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

# The Architect.

## THE WEEK.

THERE was a discussion lately at the Institute of Architects about the management of the library, which suggested one of the difficulties of a librarian's office. People are everywhere fond of taking up books, glancing at them, laying them down with the intention of having another glance, and then forgetting all about them. In the British Museum there is constant inconvenience in the Reference Library by the practice. Where books are lent it prevails as far as limits allow, and every librarian knows that books are returned to him which have never been opened by the borrowers. In a limited library any irregularity becomes almost fatal, and we are not surprised to find that in consequence of the delay in returning books, the Council of the Edinburgh Architectural Association have been compelled to close the library until further notice. Some of the books are mere shilling volumes, which the members might be supposed to be able to purchase; but works like VIOLLET-LE-DUC'S "Dictionnaire" in several volumes, and SHARPE'S "Parallels," are expensive, and may be often needed for reference, and it is selfish on a borrower's part to detain them longer than is necessary.

THE collection of architectural drawings which was exhibited at the Institute was of extreme interest. It was curious to observe the contrast between the old and the modern styles. The bulk of the drawings belonged to the present century, and certainly there was a great variety in the execution. A larger number of THOMAS ALLOM'S drawings might have been obtained. No man was more loyal to the profession. It would also have been of interest to have had some of the sketches which were made by H. K. BROWNE ("Phiz") about the same time as those by MCKENZIE, and more than one of TALBOT BURY'S drawings or lithographs should have been exhibited. DIGBY WYATT'S vigorous sketches of Italian detail were also deserving of some notice. But the difficulty of gathering a number of drawings must be considered, and the limited space which had to be filled.

A REMARKABLE discovery has been made near Paris, being nothing less than a work of PHILIBERT DELORME, and of all places it has been found at Mont Valérien, which is supposed to be the principal fort in connection with the defence of the city. The work in question is an arcade, with niches for statuary, which at one time formed the entrance to the cemetery at Nogent. On the destruction of the cemetery, the arcade was given over to the monks of Calvary, who had a house there. They preserved it until some time in the last century, when it was purchased by a gentleman, who converted it into a park entrance. Under what circumstances it found its way from a village on the east side of Paris to a fortification on the west side has yet to be discovered, but there appears to be sufficient evidence to satisfy French archaeologists of the genuineness of the arcade as a work of the architect of the Tuileries, who died in 1577. It might with more reason be supposed to have formed a part of the structure which surrounded the Calvary, which was founded on Mont Valérien in the reign of LOUIS XIII., and became a place of pilgrimage from all parts of France.

THE last competition of the Bradford School Board by itself is enough to demonstrate the necessity of a professional assessor, and make architects refrain from competing unless one had been nominated. About seventy sets of plans were submitted, and eventually the prize was awarded to a design described as "No. 24," which bore the motto, "Thought, Examples, and Experience." The process of selection was irregular, even if judged by committee morality. Five sets, including No. 7 and No. 24, were selected on December 10; nine days afterwards No. 7 and No. 24 were set aside. The chairman of the Board about that time was attacked with sciatica, and from his sick chamber he sent a request that No. 7 and No. 24 should be re-admitted. The members could hardly refuse anything

that would assuage the pains of their chief, so the plans were brought back. Afterwards there was a convenient absence on the part of some of the members, others were tacticians, and declined to vote at certain times. In this way No. 24 found itself chosen. The spirit in which the Board discharged their duties may be inferred from a statement of the chairman. He said that "he had never in any way sought to influence votes since he had been on the Board for any friend of his, or in the interests of any special party. He had been asked to vote for the appointment of a certain individual, on condition that if he did so the member making the request would vote for a friend of his, but he declined to do that." This may exonerate the chairman, but, from what he says, it is plain that log-rolling prevails in the Board-room, and is looked on as a part of the machinery of business. At the last meeting of the Board, a few members who suffered compunctious visitings of conscience for their former indifference brought up the subject of the late competition, with curious results. An equal number of votes was given for and against an amendment disapproving of the action of the Sites and Buildings Committee. The casting vote of the chairman upheld the committee. The same thing happened when the formal award of the prizes in the competition was proposed. A member finally proposed that Mr. E. R. ROBSON or another experienced architect should be asked to give a report on the designs, and once more the casting vote of the chairman decided the contest. Whether the opponents of the fortunate design are correct it is impossible to say, but a prize won under such circumstances cannot give much pride to the possessor.

AN exhibition of the works of the late HANS MAKART has been opened in Vienna, but it does not contain the pictures on which the painter's reputation mainly depends. The *Catherine Cornaro* is in Berlin, the *Entry of Charles V.* is in Hamburg, the *Plague of Florence* is in Florence. The picture called *Printemps*, on which MAKART was engaged at the time of his death, has been withheld, as his executor feared damage might arise to it while being carried to the exhibition. It is considered that the principal attraction in the gallery is the unfinished series of paintings which MAKART had in hand for the new Fine Arts Museum in Vienna. After the exhibition closes there will be a sale of the valuable collection of *bric-à-brac* belonging to the artist, which is likely to attract many connoisseurs.

A MEETING of the archdeacons and rural deans, under the presidency of the Bishop of the Diocese, was held at Norwich, on Saturday last, for the purpose of electing a surveyor for ecclesiastical dilapidations in the place of the late Mr. PHIPSON, F.S.A. It was unanimously decided to have two surveyors in the place of one. Mr. HERBERT GREEN, of Norwich, and Mr. E. F. BISSHOPP, of Ipswich, were elected, Mr. GREEN obtaining twenty-five votes, and Mr. BISSHOPP eleven votes. Mr. CLEMENCE, of Lowestoft, Mr. LACEY, Mr. WILLINS, and Mr. PEARCE, of Norwich; Mr. LÖHR, Mr. ROLFE, and Mr. MILNE, of London, were also candidates.

It has been resolved that the exhibition of the works of EUGÈNE DELACROIX, which is expected to be a source to derive money for the memorial, is to be held in the Ecole des Beaux-Arts, Paris, from March 1 to April 30. MM. MEISSONIER, PAUL DUBOIS, BAUDRY, GÉROME, LÉON BONNAT, and JULES DUPRÉ, on the part of the Memorial Committee, have been requested to solicit the loan of works for the exhibition. There are not many of the painter's works in this country, but Sir RICHARD WALLACE possesses *The Death of Marino Faliero* and *Faust and Mephistopheles*.

A CASE which was heard in the Preston County Court on Monday may serve as a warning to investors in antique furniture. Mr. HENRY LORD, architect, in December last purchased an oak chest and chair for 10*l*. According to his evidence, the dealer stated that the carvings on both were ancient. When the two articles were submitted to an expert on their arrival in Manchester, he said that the woodwork of both articles was ancient, but the carving, with the exception of a small portion, was modern. The dealer denied having given a warranty, and the judge nonsuited Mr. LORD. The moral to be drawn is to have the warranty in writing, if the purchaser cannot trust his own judgment.

## THE ASSOCIATES' VOTE AND THE INSTITUTE CHARTER.

THE memorial presented in the name of the Associates of the Royal Institute of British Architects at the opening meeting of this session was a very important one. It was extensively signed, and those who supported it, judging from the reports of the meeting held during the last conference, are unanimous in their action and resolute in carrying their desire into execution. What is sought for is that the franchise of the Institute shall be extended to themselves, the Associates. The answer to this demand has hitherto been, "The charter is against you." The Associates reply, "Then let us have it altered." Mr. CATES, one of the strongest men on the Council, and always earnest in his support of young men, some time ago foreshadowed changes that would demand some revision of the charter and extension of the aims of the Institute. Mr. CHRISTIAN, the President, in his observations on the occasion of the presentation of the memorial, gave great encouragement to the Associates, and stated that in the address which he was about to deliver he had anticipated their wishes. The conclusion we draw from this is, that many of the Council are fully alive to the alterations that have taken place in the profession generally, and are anxious to march with the times, and, by judicious and well-considered reforms, to strengthen the Institute and make it more popular and representative.

At the time the charter was granted, the Associates were a very small number, and doubtless were chiefly drawn from the class of assistants who were, so to speak, probationers, hardly representative of the profession. Since 1837 (the date of the charter) the class of Associates has risen to the large number of over 690, and exceeds the number of the Fellows by over 280. In the ranks of the Associates are to be found men who are quite as competent as many of the Fellows, carrying out important works, entrusted with large responsibilities, and in the enjoyment of fairly lucrative practices as architects and surveyors. Many of these gentlemen would doubtless become Fellows of the Institute but for the fact that, under the charter, they would be debarred from following their practice of taking out quantities. Another reason that may be urged in favour of a vote being given them is, that recently a by-law has been passed making it obligatory for Associates to pass a test examination before admitting them to the Institute, thus raising the standard, but hitherto granting no additional privilege to those who pass the examination and present themselves for election.

Then the contribution made by the Associates to the funds of the Institute is a very large proportion, yet, under the present restrictions, they have no voice whatever in the expenditure of the income they subscribe. In other societies incorporated recently, such as the Surveyors' Institute, which is very flourishing and well organised, the Associates have a vote. Again, the extension of the franchise in the political world has called attention to the anomaly which exists in the Institute of Architects, and no surprise need be felt that the Associates have at last determined to try and see whether they cannot remove the reproach which now attaches to them, and obtain from the President, Council, and Fellows a right, which, we can see no reason should be withheld any longer. We can trace no sign of any real opposition to this reasonable request; only advantage can result from acceding to it, and this should be done with courtesy and graciousness. We believe that those who are most alive to the good of the profession will lend their aid to accomplish this object, and the Associates themselves should not rest satisfied or accept anything short of a vote equal to that enjoyed by the Fellows. That there should be certain restrictions in their voting power is reasonable and usual in all such societies.

The difficulty that many Fellows will see in the touching of their charter is, perhaps, the sacrifice of it in its present form. But if to conserve it they are compelled to withhold this measure of justice from the Associates, they must be prepared to see a large secession from the ranks of the Institute, which will most assuredly follow. Then of what value is the charter to the Institute? We have always maintained that the Institute is, and should be, the representative body in the profession; but it simply cannot

maintain that position unless it absorbs into itself the young blood, which gives vitality and vigour to all institutions. Open the vein, drain away the blood, and a feeble and inert body is left. We feel confident that, if the Council will look the problem steadily in the face, the solution of it is not so difficult a matter.

Precisely in what way the change is to be made we shall not stop now to consider. The government authorities charged with the conduct of such matters will doubtless, if they are made aware of all the circumstances, be desirous of furthering the wishes of the Institute, if they can be assured that by so doing they further the aim and object of the profession, and thereby benefit public interests. Our sympathies are entirely with those who desire to maintain the date of incorporation, and to keep up the prestige that results from that; and if, happily, some plan may be devised whereby this is accomplished, the vote granted to Associates, and other reforms gained, we should rejoice. If, on the other hand, a fresh charter is necessary, let that be applied for. Even with a new charter the date of the original incorporation may be maintained on all the official documents of the Institute, and we do not see that it will lose one jot or tittle of its honour or dignity, but rather gain in both.

What use will the Associates make of their voting power when they get it? We can only surmise, but we imagine that in the election of the Council they will plump for those men who they think are most alive to the duties devolving upon them as the governing body. This will probably bring about more frequent changes at the Council body, and thereby an accession of energy, which, curbed by the more experienced at the table, will result in a prompter discharge of the duties imposed upon them. Members of the Council will be stirred to greater activity, greater decision and firmness will mark their actions, and the voice with which the Council then speaks will be less uncertain in its sound, because, cognisant of the views, hopes, and wishes of those outside the walls of the council-chamber, the tone will be firmer and more confident. Men respect strength and decision of character, and are more ready to forgive and condone an error of judgment resulting therefrom, than eminently respectable officialism, guarded at all points, and robbed of everything likely to give offence.

One thing to the observer's eye is clear: the Council has not now that influence which it ought to have, if it is to exercise any power at all. For this reason, and speaking in the best interests of the Institute, we desire to see this change in its constitution, feeling sure that great practical good will result. We should also hail with satisfaction the presence of two or more Associates on the Council, still further making it representative of the Society. The nomination and election of the President of the Architectural Association on the Council for the first time last year, and the wish expressed by Mr. CHRISTIAN in his address that that precedent might be repeated and become a custom, will be productive, we hope, of good. The Architectural Association contains the architects of the future, has been most useful to the profession, and is an ever-increasing body; it was therefore a wise and politic step to give its chief officer a seat on the Council of the Institute, and the Institute should do all in its power to cultivate a feeling of unity, and aid the younger Society by all legitimate means. Another result which may be expected to follow an extension of the franchise will be a larger attendance at the ordinary and business meetings. If the Associates have the vote, they will be more anxious and eager to speak and take part in the discussions, knowing that when questions have to be settled they will have a voice in the matter; and we do not think any alarm need be felt as to how that voice will be expressed. It has been too often the habit in past times to snub young men when they got up to express their views, with the usual, but unfortunate, result that bitterness was engendered and the speaker discouraged. Anything that will give life and vigour to the meetings would be a great gain, an improvement on the present dulness, too often visible. In conclusion, we hope that the Council will be prompt in their action in dealing with the memorial, and not let the grass grow under their feet. Their action and decision are being, we doubt not, watched with great interest.

## TOWN VERSUS COUNTRY.

IN the genial address which was delivered by the President of the Royal Academy at Canterbury there are many things which merit consideration, but we have now to deal with only one of them. It is well known that people in the provinces occasionally feel that they are at a disadvantage when compared with the inhabitants of the metropolis, and a student of an art school in a small town might be excused for having more or less despondency about his future if he stuck to art. In a manufacturing town there are always openings, but in a staid cathedral city like Canterbury or Lincoln, people who will buy designs or paintings are necessarily rare, and those encouraging stories of good fortune which are incentives to exertion cannot be heard every day in the classes. It was, therefore, both wise and kind on Sir FREDERICK LEIGHTON'S part to recall the names of Old CROME and JOHN SELL COTMAN, who also belonged to a cathedral city, and to tell the Canterbury students that "most of our greatest artists come to us from the purer air of the provinces." This is an interesting fact which is worth consideration.

In the first place, it may be remarked that in all kinds of businesses, trades, professions, as well as among artists, the majority of those engaged are not natives of London. Physiologists say that families in the metropolis do not endure, and, if it were not for the continual additions from other parts of Great Britain and elsewhere, the city would lose its position. This is especially seen in the arts. Take any society, from the Royal Academy to the Architectural Association, and it will be found that members who have a claim to be called cockneys are in a minority. Provincial architects are rather disposed to imagine that their London brethren assume airs and look down on the practice in country towns. But where are the native London architects? In a profession which counts so many members, there must be a goodly number who come under that class, but we maintain the great body of architects in the metropolis is made up of men from the provinces, Scotland, and Ireland. In painting and sculpture there is a much less proportion of London men.

This is no new phenomenon. Take, for example, the Royal Academy at the time of its foundation, which is as good a test as can be applied. The President came from Plympton, and among the thirty-three names appearing in the catalogue of the first exhibition, in 1769, we can only find six which can, with certainty, be said to belong to London members. The remainder is made up of provincial, Irish, and foreign artists. The proportions may have varied, but the metropolis was always in a minority. It is also worth noting that not one of the presidents has been a native of London.

Some parts of England are apparently more fruitful of artists than other parts. Devonshire is a remarkable example. REYNOLDS was a Plympton man, EASTLAKE, NORTHCOTE, and HAYDON, were fellow-townsmen from Plymouth. HAYMAN, the painter, and STEPHENS, the sculptor, belonged to Exeter. Many other names could be cited, and would appear to bear out the theory that pure air and beautiful scenery have much to do with the making of an artist.

In the same way the marvellous success of Scotsmen in art might be explained. If among the foundation members of the Academy they are not to be found, they were not long before they secured recognition; and it is not improbable that in a few years the majority of the members will be from beyond the Tweed. There never was a Devonshire school, and the Norwich school was, after all, but limited; but the strongly characterised personality of the northern works, of which Sir FREDERICK LEIGHTON spoke is certain to have an extensive influence. The only danger is that, owing to the attraction exercised by London, the artists may be induced to emigrate southwards before they have matured their style, and that those who remain in Edinburgh or Glasgow will be powerless to retain the characteristics which are necessary to give distinction to a school.

It is undoubtedly a great advantage for the northern painter to find so much beauty in the scenery and so many vigorous forms wherever he may turn. He has mountains,

foaming torrents, calm lochs, pastoral scenery of the softest kind, and if he has a turn for history or legends the literature of the country affords him an abundant supply. It is no wonder that foreign artists, in spite of the disadvantages under which they labour, have been fascinated by Scotland. An island like Arran affords subjects for years; and it might be said that a student who confined himself to the Castle Rock of Edinburgh would find a new subject every day in the variation of colour, the play of light and shade, which almost endow it with life. But brown heath and shaggy wood, mountains and floods, would be useless without energy, is seen from a comparison between Scotland and Ireland.

The scenery in Ireland is no less remarkable than that of Scotland. It would be difficult to discover anything in North Britain which will compare with the cliffs of Donegal and Clare; the mountains of Galway and Kerry have as much stern grandeur as is to be found in any part of Europe. Such coast scenery as is seen at Glengariff, the Killarneys, Clew Bay, Carlingford, in another country would attract admiring crowds. The Munster Blackwater surprises every stranger with its beauty, and excursionists and guides cannot deprive Killarney of its charms. Dreary and monotonous as the bogs appear at first sight, Mr. WHISTLER could in any of them find materials in the course of a day for symphonies in brown and gold that would afford a refreshing novelty to the jaded eyes of Bond Street loungers, and out of the desolation that is found at Clonmacnoise on the Shannon, a river scene could be produced that would surpass everything that is to be derived from Battersea or Bermondsey. Within less than an hour's journey on every side of Dublin picturesque scenes are to be found. But although nature has been so liberal in affording delight for the eye in Ireland, it is astonishing how few landscape painters have been derived from the island. In the last century GEORGE BARRET obtained so much applause in London for a couple of landscapes he brought over from Dublin that his head was nearly turned. His countryman, DANBY, at a later time could not complain of want of patronage, although he might be supposed to be too imaginative to suit English taste. Irish landscape-painting in England is represented by those two artists, unless we include the vigorous sea-pieces of Mr. EDWIN HAYES in that class of work. From time to time a few men have appeared, but they were wanting in perseverance, and failed to make their mark.

The Irish figure-painters have been more numerous. BARRY's success might have convinced his countrymen that there was a field for them in England. About ten years after BARRY's death, WILLIAM MULREADY, who belonged to the little town of Ennis, in Clare, was elected an Academician. In 1830 a third Irishman, MARTIN ARCHER SHEE, from Dublin, who, like BARRY, was a protégé of EDMUND BURKE, rose to the presidency of the Academy. In this case the honour was probably due to SHEE's social and oratorical gifts rather than to his skill in portrait-painting. DANIEL MACLISE, a Cork man, who was elected in 1840, might also have worn the president's red gown if he cared for the honour. ELMORE, from the more remote Clonakilty, was another representative of his country among Academicians. If water-colour art were recognisable there, the Irish Director of the National Gallery would be entitled to a like position. FOLEY and MACDOWELL and LAWLOR gained reputation as sculptors. JOHN HOGAN, another Irishman, was one of the few British members of the Pantheon in Rome, but his works are almost unknown in England.

When we consider the history of art in England, it is difficult to avoid drawing the conclusion that at one time the provincial spirit, which is so efficacious in giving vitality to painting and sculpture, was likely to have been derived from Ireland. The Irish painters and sculptors gained a footing in England before the Scotsmen, but they failed to keep it; and not only is the Royal Academy at the present time without an Irish member, but among the artists who are likely to be candidates, there is not one Irishman. Do the Irish painters ever think of this?

London cannot compete with the rest of Great Britain as a birthplace of artists, but its "roll of fame" contains names of which any city or country might be proud. Genius is full of freaks, and has an odd way of appearing in places where it is least expected, and thus MALLORD

TURNER, one of the greatest of landscape painters, comes out of a barber's shop in the narrow Maiden Lane; the visionary BLAKE cultivated his fine fancies in a hosier's shop near Golden Square; and WILLIAM HUNT, who knew more about flowers and country boys than any man of his time, was brought up amidst the constant hammering of a tinsmith's shop in Long Acre. HOGARTH was also a Londoner, and the future realist began with engraving heraldic animals, somewhere near Leicester Square. CHARLES LESLIE, LEECH, CRUIKSHANK, three humourists whose names may worthily be placed alongside HOGARTH'S, can also be claimed by London. Then there are INIGO JONES, EDWIN LANDSEER, the two BACONS, and BANKS, the sculptors; COCKERELL, ELMES, JAMES WARD, the animal painter; WILLIAM COLLINS, Sir A. W. CALLCOTT, and many other men whose reputation is likely to endure. But it must be said that London, in proportion to the number of its inhabitants, does produce rather few artists. Whether this arises from the opportunities which exist of dispelling all romance about the artist's life, or from more profitable employments awaiting the inhabitants, or from seeing too many pictures, has yet to be determined by those members of the Statistical Society who can so readily solve the most difficult problems by the aid of arithmetic.

It is remarkable that in France we also see how much art owes to provincial recruits. Among the painters MEISSONIER comes from Lyons, so does PUVIS DE CHAVANNES, GÉROME comes from Vesoul, near the eastern boundary of the country, PAUL BAUDRY from Roche-sur-Yon, HENNER from Alsace, CABANEL from Montpellier, BONNAT from Bayonne, J. P. LAURENS from Fourguevaux, BOUGUEREAU from La Rochelle, CAROLUS DURAN from Lille, HEBERT from Grenoble. The sculptors who are most widely known, such as MM. CHAPU, GUILLAUME, FALGUIÈRE, CARRIER-BELLEUSE, CRAUK, PAUL DUBOIS, are provincial men. The architects, on the other hand, who have gained the highest distinction are generally Parisians. MM. GARNIER, VAUDREMER, BALLU, ANDRÉ, BAILLY, QUESTEL, ABADIE, who have attained the dignity of chairs at the Institute, are all natives of Paris. Why there should be so remarkable a difference between architecture and its sister arts may be explained by the influence which is exercised on the mind by early associations. There are splendid buildings all over France, but the sight of one or two cathedrals or churches in a town is not so impressive to the imagination of the young as the public and private buildings of a city like Paris.

### THE ARCHITECTURAL ASSOCIATION.

THE eighth ordinary meeting of the Association was held on Friday evening, the 30th ult., Mr. H. W. Pratt, vice-president, in the chair. A vote of thanks was passed to Mr. Harris in connection with the visit to St. Marylebone parish church.

Mr. W. H. ATKIN BERRY, hon. secretary, said that some tickets had been placed at their disposal by the Carpenters' Company for a course of free lectures to be given at Carpenters' Hall, the first of the series to be delivered by Professor Kerr on the evening of the 11th inst.

The next meeting of the Association, it was pointed out, would take place on the 6th inst.

The business set down for the evening was the discussion of a paper, read by Professor Kerr at the Conference of Architects last year, under the title of

#### English Architecture Thirty Years Hence.

Professor KERR offered some preliminary remarks. He explained that he had no wish to interfere with perfect freedom of debate; but as some of the criticisms passed on his paper seemed to have missed the mark intended by him, he would tell them how the paper came to be written and to be read, more especially as some of his critics had spoken as if he had come forward presumptuously to make prognostications of the future, but had not done so. The Conference Committee had thought it well to discuss the immediate future of the profession, and had asked him to undertake to read a paper on the subject. In the journal in which he had the privilege to write, he had taken a peculiar view of architecture. He had altogether discountenanced the idea that we had been baffled in any points. He contended that we were advancing now by some minor arts on a certain course, and he saw no reason to doubt that in the next or the following generation England would take the lead

in the world. His doctrine involved the assertion of the abandonment of the academicalism of the arts and the recognition of freedom of thought, and what might be called universalism in art; perfect liberty and equality in all the arts; generosity of all artists towards each other, &c., and on the basis of this he contended that England was now assuming an honourable position which it was desirable to understand, and which it was to the advantage of art to speculate on. Mr. Kerr then looked at England as compared with other European nations, and, pointing out the differences of national characteristics, said it might safely be acknowledged that the English were not a sentimental race; they preferred practical views in everything, and they preferred to see a substantial outcome rather than anything that might be called visionary or transcendental.

During the last thirty or thirty-five years a remarkable change had come over the mind of the country with regard to art, and compared with the sluggish intelligence of the period before the Exhibition of '51, the state of things at present as to the arts universally was as different as one thing could be different from another on the same ground. In the domain of art, English intelligence was now acquiring a national purpose peculiar to itself, one which was specially identified with the broad basis on which English operations were universally performed, and which was summed up in the phrase that England is the workshop of the world. This pointed to industrial art in its widest sense, and he contended that industrial art would and must develop into art of altogether a different kind from anything which had hitherto been accepted in Europe, either in ancient or modern times; and it was in this respect that he expected England to take the lead. The Professor next spoke of what used to be called the sacred circle of the academical arts, and showed how the principle of academicalism and exclusiveness had been losing favour and had become gradually undermined—circumstances under which architecture had in the last fifty years come in a remarkable way to the front, and, as the minor arts rose into a position of public recognition, they had formed a cluster or galaxy of art around it. Mr. Kerr spoke of the peculiar position occupied by architecture as an art, because it combined as no other profession did three elements which were seldom found combined at all—art, meaning artistic design; science, meaning the mathematical contrivance of construction; and, lastly, commerce. The question dictated to him by the Conference Committee was, "What was coming?" There was one way of discerning what was coming. To take a leap, we should go backward and then take a run forward, and the force of the momentum carried us forward in the one direction towards which we tended. To find out, then, what the progress of art would be, it would be best to go back so as to get a run forward, keeping steadily on the course that public taste was taking, and having acquired a momentum, let it carry you on as it would. For this precise purpose he had adopted the principle of retrospection and not of foresight. Persons were apt to consider what ought to be coming, and this was a matter of opinion only rather than what was coming, which was a matter of fact. What would be was matter of calm and dispassionate calculation based on sufficient data and sufficient means; or, to put it in another way, they might inquire what was the general direction public taste was now taking, and what might they, as young men, gather for their own profit out of a studious contemplation of the course which had been pursued for so many years as regarded its being pursued for so many years to come? The modern European style of architecture was an expression of his own that he had used for some years. It must be perfectly plain, when you considered what modern Europe was, that the idea of modern Europe existing without its own modern style of architecture was impossible. Modern Europe had its rise in the fifteenth century. The modern style rose at the same time. It had pursued a certain characteristic course ever since, and with its examples, good or bad, it had been continuous. Whatever its merits or demerits, it could not be denied that Classic was the modern European style, and in this we had a basis on which to stand. Turning to another remarkable incident without entering on to the question of its merits, Professor Kerr said it was enough to understand that, regarding the Gothic revival as an episode in the history of English architecture, it introduced into the modern architectural mind, especially in this country, the element of vigour. It was said that the modern European style, pure and simple, had become effete, that it lacked masculinity, vigour, &c., while Gothic was characterised by vigour, truthfulness, determination to turn neither to the right nor to the left.

Next there was the incident of the Exhibition of '51. Some people were accustomed to sneer at the Exhibition and all that it brought forth. The sneer was a vain and a futile one. No enterprise in the whole history of art had ever produced in so short a time what that enterprise produced in England. It brought immediately into prominence the universality of the minor arts or industrial art, a word more expressive than the mere term "minor arts," which indicated only the subserviency

of those arts not included in the academical régime. Mr. Kerr recounted the changes effected, among others, as to liberty, freedom, criticism, &c., and the rise of popular art in England, which every day became more and more pronounced, and from all this he contended that the future of England lay along a path of great distinction; and, having completed his arguments, he deduced that, as a matter of fact, the Italian must be accepted as the style of the present age, and pointed to this style in conjunction with the two main elements or leading features of Classic and Gothic, namely, the grace of the former and the vigour of the latter as what was coming.

The CHAIRMAN said that Professor Kerr had laid great stress on what he termed the modern European style, but had not, he thought, given sufficient importance to the Gothic revival, for in passing criticism on it he had called it a mere episode in the history of English architecture. Now, the revival was surely to be regarded as something more than that. Would a mere episode have taken so deep a root in the country as it had done, and still continued to hold? It could not be considered a thing of the past, either now or during the next thirty years. No doubt it was influenced and carried on by the ecclesiastical branch of architecture. It had influenced civil and domestic architecture; but in these branches its life had been short, or at any rate it had not been taken up to the same extent. But it would be a long time before ecclesiastical architecture changed from the Gothic to the modern European style, or any other style. It was true that free Classic had been taken as a model or style which might be developed in church architecture, but that it would take any prominent part in this direction during the next thirty years he did not believe. Love of Gothic was so deeply rooted in the hearts not only of architects, but of the people of this country, that it would die hard. He thought the tendency of the day was to develop the later phases of Gothic. Now that speculative builders and quack architects were beginning to parody this free Classic, we should have to turn to some other style. The architecture of the next thirty years would depend probably on the influence of leading architects. In the past few years we had lost all our leading Gothic men, and consequently there was a dearth of leaders to guide us in this direction. Mr. Norman Shaw was still with us; in any other style than that in which he now worked he would have very many followers, as indeed he always had.

Mr. A. B. PITE said they did not seem out of the wood yet. What sort of work would they do, after this further consideration of "Architecture Thirty Years Hence?" Would it be anything different from what they had hitherto had? They would break up that evening with the question unanswered. Professor Kerr had very ably and brilliantly drawn their minds back to the rise of the Italian Renaissance. He had told them they must run backwards and then run forwards, and then take a jump and see where they got to. If they had lived a hundred years or fifty years ago, would any number of runs forward and jumps have brought them into the present state in which Queen Anne had plunged them? He did not think architecture went forward exactly in jumps. We seemed to be entirely at the disposal of geniuses. There was no reason for the rise of the Italian Renaissance except for Michel Angelo, Bramante, &c.; for the Gothic revival except for Ruskin and others; and there was no other reason for Queen Anne except for the existence of Mr. Norman Shaw. Art seemed entirely at the mercy of a few men. Architects of the nineteenth century lived in an age of architectural springs or founts. One revival had followed on another, and we were now in the throes of a nine years' wonder in the shape of Queen Anne. Architects of the nineteenth century would be looked on as a most eccentric set. The century would be put down as one of power, though the architecture of Queen Victoria Street and Moorgate Street, which the Professor considered the style of the future, would not be owned by architects as a profession. Mr. Pite moved that their most cordial thanks should be given to the Professor for his kindness in addressing them.

Mr. BLAGROVE, who seconded the vote, said he thought the style of the future would be eclectic. He called to mind that Professor Kerr had before then proved a true prophet, and had discerned the signs of coming change long before even Mr. Street.

Mr. BLASHILL said that he had proposed to the Conference Committee that it would be well to have a paper on the future of English architecture. As none of them felt qualified to deal with the subject, they had asked Professor Kerr to do so. He attributed the rise of the Italian Renaissance to be due to the great impulse given to study of pagan art, literature, &c., at that time. He was not prepared to say that anything like the pure Italian style alluded to by Professor Kerr would take the place of everything. There must necessarily be a best style, and it was for the young architects to find it out.

Mr. HOOPER thanked Professor Kerr for the encouraging view he had held out to them. Signs of progress in art there were, indeed, even in the humblest matters. The Renaissance, he believed, had its rise among the educated classes, as also the Gothic revival had.

Mr. H. D. APPLETON pointed out the improvement in architectural criticism among laymen.

Mr. W. H. WOOD thought they had not gone back far enough. Every one in ancient Greece was an artist, or understood art; so it was impossible for an artist to do bad work. The Romans sought out good artists, and employed them. Religious fervour was the ruling influence in Mediæval times, and also underlaid the Gothic revival. In the past few years, on the contrary, scepticism had arisen.

Mr. T. ELLISON said Professor Kerr had preached a funeral sermon over Gothic, and Mr. Pite on Classic. They must, however, at least own that the ghosts of both still walked the land.

Mr. JOHNSTON thought there was too much restlessness nowadays. Architecture would be all the better if sober judgment and careful attention guided architects in their studies and in their actual works.

The vote of thanks was then carried by acclamation.

Professor KERR thanked the members, and the meeting adjourned.

## BRITISH SCHOOL OF ARCHÆOLOGY AT ATHENS.

A MEETING of the promoters of the proposed British School of Archæology in Athens was held on Monday in Albemarle Street. The Bishop of Durham presided. The report stated that the committee had accepted from the Greek Government a piece of ground at Athens containing nearly two acres, for the proposed British school. It was in the immediate vicinity of Athens, on the southern slope of Mount Lycabettus, west of the Monastery of Asomatos, and was valued at about 2,700*l.* The upper part commanded a view of Mount Hymettus in front, while the Bay of Phaleron and the Island of Ægina were visible to the right. The funds were estimated at about 4,000*l.* This sum would suffice to build a house containing accommodation for a resident director, and affording one good-sized room to serve as the library of the school. Besides building such a house, the sum of 4,000*l.* would also, it was believed, suffice to provide a library of reference for the school, or at any rate the nucleus of such a library.

The Chairman, in moving the adoption of the report, said his own studies led him across some question of Classical archæology almost from day to day. When he wanted his difficulties solved he had to go, not to any English source, but to some monograph in German, French, or sometimes in Italian. It was very rarely that he could find what he required in English. That was a state of things with which we ought not to be content. It was a great satisfaction to know that the Universities were taking up the study of archæology, making it part of their examination system, and so endeavouring to promote its spread. But what we wanted was to connect ourselves directly with the heart of Hellenic culture so that its very lifeblood might flow through our veins, and this we should gain by the establishment of the school at Athens.

Mr. C. T. Newton moved a resolution to the effect that the first aim of the school should be to promote the study of Greek archæology in all its departments. Among these should be the study of Greek art and architecture in their remains of every period, the study of inscriptions, the exploration of ancient sites, and the tracing of ancient roads and routes of traffic; that it should be a school of classical studies, and that the director should afford information and advice to all properly-accredited British travellers in Greece who might apply to him. In describing what had been done by other nations, Mr. Newton said there was room for inquirers in Greece. A single ancient city would take years to explore thoroughly. It would be a regret to him for the rest of his life that he had been called away from Cnidus after considerable exploration, but without having explored a tenth part of the city. At Halicarnassus, again, he had made what he might call a house-to-house visitation to see where there might be any inscriptions, and yet since he had left inscriptions of the highest value had been discovered. Besides these cities, there were others, of which "Vidi tantum" was the only entry in the traveller's note-book.

Professor Jebb, in proposing that a part of the funds subscribed should be expended in erecting a suitable building, stated that the executive committee had had the good fortune to receive the aid of Mr. Penrose, than whom no one could more appropriately design a home for a British School at Athens.

Mr. Penrose exhibited the plans for the proposed house, and explained that it would be possible to make a lateral extension afterwards, if it should be found necessary. He thought that the building itself, without any extension at present, could be built for 3,000*l.*

It was finally resolved—"That a formal appeal in aid of the school be made to the Universities, the Royal Society, the Society of Antiquaries, the Hellenic Society, the Royal Academy, the Institute of British Architects, and other public bodies."

## THE ARTISTS' CORPS.

THE annual meeting and distribution of prizes of the 20th Middlesex Rifles was held on Saturday evening at the Criterion, Piccadilly. There was a large gathering of the friends and members of the regiment. Lieutenant-Colonel Edis, commanding, who was supported by Sir Frederick Leighton, P.R.A., honorary colonel, and most of the officers, gave a brief *résumé* of the work done during the past year, and in congratulating the regiment on its general efficiency and on the great improvement shown in shooting, urged increased efforts. They had 732 efficient out of a total enrolled strength of 743, or a percentage of 98.5, and the improvement in musketry practice was shown in the fact that the marksmen had increased from 133 to 155. Now that the Martini-Henry rifle had been issued to the regiment he hoped that much better results would be obtained, and that the year on which they had now entered would produce a still larger increase of marksmen and first-class shots. Colonel Edis was glad to say that the regiment was generally in a very efficient state, that the finances were satisfactory, and that the musters at all the important parades had been good. With reference to the work of this year, first of all they would attend the manœuvres at Brighton. They might not all like Brighton for the work, but, as the review was fixed to be held there by the Field-Marshal Commanding-in-Chief, it was their duty to support His Royal Highness's views, and he hoped he would see 500 men on parade on Good Friday morning. He hoped also to take the whole battalion to Aldershot for a week's training with the Regular troops, as he believed that the experience to be gained there was of the first importance to all Volunteer regiments, as teaching them the duties and discipline of camp life. In conclusion, Colonel Edis said that as the political horizon was clouded it behoved them as volunteers to do their utmost to promote real efficiency. The prizes were then distributed by Sir Frederick Leighton, the principal winners being as follows:—Hartley Challenge Cup and Jewel, Private Willett; Marksmen's series, Sergeant J. Phillips, Private Willett, Sergeant Bigsby, and Private Hawkes: field firing, Private Ingles, Sergeant Williams, and Privates Dove and Billson; judging distance, Private Thompson; battalion marksman, Private Wells, &c. At the close of the distribution, in response to a vote of thanks, Sir Frederick Leighton expressed the pleasure he felt in coming among his old comrades, and remarking upon the excellent report furnished by Colonel Edis, said it was particularly gratifying, as these were days when Englishmen could not afford to neglect their duty. Afterwards the regiment dined together to the number of about 300. Colonel Edis, who was in the chair, was supported by a large and distinguished number of guests.

## TESSERÆ.

## Skill in Colour.

C. R. LESLIE, R.A.

IT is a fatal error to believe that colour is a matter of more easy acquirement than form; I conceive it to be far more difficult. Form may be measured; its anatomical structure may be investigated; its lines are not changed, as tints perpetually are, by the shifting light of day or the accidents of reflexes. If the beauties of form are subtle, those of colour are evanescent; and, combined with *chiaro-oscuro*, from which, in nature, they are inseparable, they become the last refinements of the art, as it addresses itself to the eye. It must be remembered that at the present day there are greater obstacles in the way of becoming colourists than existed in the infancy of painting. The discovery of *chiaro-oscuro* has much increased the difficulties of colouring; and, unfortunately, ever since the time of Raphael indolence in a study so difficult has been able to shelter itself under the example of him who was indolent in nothing that belonged to the art.

## Origin of Caryatids.

CHEVALIER E. Q. VISCONTI.

Vitruvius informs us that, after the victories obtained by the Greeks over the Persians, it became the custom to employ in some buildings, as supports or columns, statues representing either prisoners taken from the conquered nation, or the captive wives of the inhabitants of such Grecian cities as had been unfaithful to the cause of their nation. Carya, in Arcadia, was among the cities that had betrayed the Greeks; and, according to Vitruvius, it is from the name of the Caryatic women, whose statues were employed in architecture, that the technical name of this kind of support has been borrowed. The well-informed Athenians, whose remarks are engraved in an inscription, have very properly denominated the caryatids of the Temple of Pandrosos *Koras* (girls or damsels), for, in fact, they represent not captives but Athenian virgins, bearing

on their heads the sacred vases for the ceremonies of the sacrifice. Lessing believes that the tradition of Vitruvius is a fable, and that the caryatids were only Lacedæmonian virgins, who celebrated at Carya, in Laconia, the festival of Diana. The statues of Lacedæmonian virgins may very possibly have been employed as columns, in the same manner as the statues of the virgins at Attica have been in the temple of Pandrosos. In truth, no ancient caryatid with which I am acquainted represents a captive. But as the figures of Persian prisoners supported at Sparta the roof of a portico (see Pausanias, book 3, chap. ii.; Vitruvius, book 1, chap. i.), it is not wholly improbable that figures of captive women may have been employed in a similar manner in some of the Grecian edifices.

## Size in Architecture.

SIR M. D. WYATT.

The intellectual banquet falls upon senses dulled by fatigue, and, if enjoyment fails, the most nourishing mental food ceases to assimilate. The human eye can really take in, with what the great Italian architects were wont to study with much care, the "colpo d'occhio," but a limited dimension; and beyond such dimensions no increase of enjoyment can be derived from additional scale or extent of structure.

## Titian as a Colourist.

SIR DAVID WILKIE, R.A.

After seeing all the fine pictures in France, Italy, and Germany, one must come to this conclusion, that colour, if not the first, is at least an essential quality in painting. It is richness and depth alone that can do justice to the material. Upon this subject every prejudice with which I left home is, if anything, not only confirmed but increased. What Sir Joshua Reynolds wrote, and what our friend, Sir George Beaumont, so often supported, was right; and after seeing what I have seen, I am not now to be talked out of it. With us, as you know, every young exhibitor, with pink, white, and blue, thinks himself a colourist like Titian, than whom, perhaps, no painter is more misrepresented and misunderstood. I saw in Florence his famous *Venus* upon an easel, with Kirkup and Wallis by me. This picture, so often copied, and every copy a fresh mistake, is what I expected it to be—deep, yet brilliant, indescribable in its hues, yet simple beyond example in its execution and colouring. Its flesh was a simple, sober, mixed-up tint, and apparently completed while wet. No scratchings, no hatchings, no scumblings, no multiplicity of repetitions, no ultramarine, lakes, nor vermilions, and not even a mark of the brush visible—all seems melted in the fat and glowing mass; solid, yet transparent, giving the nearest approach to life that the painter's art has yet reached. This picture is, perhaps, defective in its arrangement, but in painting quite admirable. Now, can nothing like this ever be done again? Is such toning really not to be reproduced? I wish to believe the talent exists, and assure the material exists. But we have now got another system; our criterion or judging is changed. We prefer something else, or, what is still more blinding, there is a something else that we mistake for it.

## Diameter of Public Clocks.

SIR EDMUND BECKETT.

I have no difficulty in saying that one-tenth of the height from the ground is the least size which a public dial ought to be, except in some unusual positions where they can only be seen a very little way.

## The Tie Beam.

SIR JOHN ROBISON.

The thrust which a roof exerts on the walls is the most hazardous of all. Our ordinary walls, instead of being able to resist any considerable strain pressing them outwards, require in general some ties to keep them on foot. When a person thinks of the thinness and height of the walls of even a strong house, he will be surprised that they are not blown down by any strong puff of wind. A wall 3 feet thick and 60 feet high could not withstand a wind blowing at the rate of 30 feet per second (in which case it acts with a force considerably exceeding two pounds in every square foot) if it were not stiffened by cross-walls, joists, and roof, which all help to tie the different parts of the building together. A carpenter is therefore exceedingly careful to avoid every horizontal thrust, or to oppose them by other forces. And this introduces another essential part into the construction of a roof, namely, the tie or beam, laid from wall to wall, binding the feet of the rafters together. This is the sole office of the beam, and it should be considered in no other light than as a string to prevent the roof from pushing out the walls. It is indeed used for carrying the ceiling of the apartments under it, and it is even made to support a flooring. But, considered as making part of a roof, it is merely a string, and the strain which it withstands tends to tear its parts asunder. It therefore acts with its whole absolute force, and a

very small scantling would suffice if we could contrive to fasten it firmly enough to the foot of the rafter. If it is of oak we may safely subject it to a strain of three tons for every square inch of its section. And fir will safely bear a strain of two tons for every square inch. But we are obliged to give the tie-beam much larger dimensions, that we may be able to connect it with the foot of the rafter by a mortise and tenon. Iron straps are also frequently added. By attending to this office of the tie-beam the judicious carpenter is directed to the proper form of the mortise and tenon, and of the strap.

#### Modernness of the Italian Style.

SAMUEL HUGGINS.

The Italian style may claim the preference over all others in virtue of its length of possession. I know not what may be the feelings of others on this point, but to me a modern Gothic building, however unique a combination of elements it may boast, always looks like a reproduction of a Mediæval one; while an Anglo-Italian example, though of so recent a date as the other, and without one original feature, has an air of genuine and entire modernness. Why is this? It is, I believe, because the style of the former work, discontinued ages ago, was only resumed within our own recollection, as because its original examples are amongst us to remind us of the gap between their date and that of the nineteenth century representatives; whereas the style of the latter, however it originated, was in operation centuries before our time, and its example of to-day is therefore, as it were, one of an apparently interminable series, coming down from the past and leading on to the future, to which it more significantly and eloquently appeals, and to which it has as much reference as to the past.

#### Michel Angelo and Raphael.

H. FUSELI, R.A.

Michel Angelo came to nature. Nature came to Raphael; he transmitted her features like a lucid glass, unstained, unmodified. We stand in awe before Michel Angelo and tremble at the height to which he elevates us. We embrace Raphael, and follow him wherever he leads us.

#### Early Flock Hangings.

CARL ROESNER.

It is generally allowed that flock hangings were first manufactured in England and invented by Jerome Lanyer, who obtained a patent in the reign of King Charles I., dated May 1, 1634, and carried on his art in London. In this patent it is stated "that by his endeavours he hath found out an art and mystery of affixing wool, silk, and other materials of divers colours upon cloth, silk, cotton, leather, and other substances, with oil, size, and other cements, to make them useful for hangings and other occasions which he calleth Londriniana, and that the said art is his own invention." Savary in his "Dictionary of Commerce," 1720, says that *tonture-de-laine* or flock hangings were first made at Rouen, but in a coarse manner, being only used for grounds, on which, with flocks of different kinds, were formed designs of brocades. A French author, writing in 1723, says that paper-hangings called tapestry, in paper, were only employed by the country people for their cottages, or by small tradesmen in their shops and rooms. In England the manufacture continued from the time of Lanyer, and obtained a high reputation. In 1712 a duty of 13s. 4d. per square yard was imposed, and a Mr. Jackson, who established a factory at Battersea for paper-hangings of Classic design on chiaro-oscuro, writes, in a work published in 1754, in praise of his own productions, and condemns the fanciful paper-hangings at that time so much used, comparing them with the Chinese. In the year 1786 there was established at Chelsea a manufactory for paper-hangings of a very superior description, by George and Frederick Echarlts. They printed not only on paper, but also on silk and linen, and employed a number of artists in addition to workmen and children.

#### Lightning Conductors.

E. HIGHTON.

Where a building has any quantity of vertical metallic work, it is quite necessary, for its protection against lightning, that it should have an artificial lightning conductor, unless the materials of themselves form a natural one. (2) It is very desirable that all metallic circuits, especially those in a vertical direction, should be metallically connected with the system of lightning conductors. (3) In many instances a single insulated lightning conductor attached to a building may become positively injurious and dangerous, as it may cause many a cloud to discharge its electric force at that point which would otherwise have passed over and poured its terrific power into some other channel. (4) Where lightning conductors are employed they ought to be thoroughly well erected, and every course or channel that the electric fluid has open to it carefully considered, and a

division of the charge in those quarters provided against. (5) A lightning conductor, or a system of lightning conductors, where properly and scientifically erected, are perfect safeguards against the effects of heavy discharges of atmospheric electricity; but if improperly applied they may become a most dangerous addition to a building. (6) It is essentially necessary for the safety of the public that all public buildings, and especially churches, should, if naturally deficient in safe and secure lightning conduction, have artificial lightning conductors erected for their protection. That all and every town, building and vessel in the world can be most securely protected from the effects of lightning, however severe, I have not the shadow of a doubt; but, knowing from experience the terrific power of lightning, I must still assert that, as a person may be poisoned by an improper application of medicines, so may a building be destroyed, or even human life sacrificed, by an improperly or injuriously erected lightning conductor.

#### Bond in Masonry.

PROFESSOR RANKINE.

The strongest bond in ashlar masonry is that in which each course at the face of the building contains a header and a stretcher alternately, the outer end of each header resting on the middle of a stretcher of the course below, so that rather more than one-third of the area of the face consists of ends of headers. This proportion may be deviated from when circumstances require it; but in every case it is advisable that the ends of headers should not form less than one-fourth of the whole area of the face of the building.

### MANCHESTER ARCHITECTURAL ASSOCIATION.

AT a meeting held at the Old Town Hall, February 3, Mr. J. Spencer Hodgson in the chair, Mr. T. L. Worthington read a paper on "Aspects of Old Manchester," illustrated by drawings, sketches, and engravings. Having described the extent and aspects of Manchester during the British, Roman, and Saxon rules, he depicted and commented upon the appearance and progress of the town during the eleventh, twelfth, thirteenth, fourteenth, fifteenth, and sixteenth centuries, and gave a history of the cathedral church and Cheetham College. Speaking of Manchester in the seventeenth century, he described the few remnants of the old half-timbered houses of that time.

A discussion followed, in which Messrs. Chadwick, Hodgson, Mee, Harrison, and Woodhouse took part.

### MASTER BUILDERS' ASSOCIATION.

THE National Association of Master Builders of Great Britain held its half-yearly meeting on Wednesday, January 28, at the Saracen's Head Hotel, Lincoln, and local associations from London, Manchester and Salford, Liverpool, Birmingham, Bristol, Bradford, Hull, Lancaster, Doncaster, Bolton, Walsall, Northampton, Lincoln, Warrington, Ashton-under-Lyne, and Stalybridge, were represented.

The report and accounts for the past half-year were read and adopted. Mr. W. H. Cowlin, of Bristol, was elected president; Mr. R. Neill, junr., of Manchester, and Mr. J. H. Colls, of London, were elected vice-presidents; Mr. Stanley G. Bird, of London, was elected hon. vice-president; Mr. J. C. White was re-elected treasurer; and Mr. Joseph Stevenson Jones, of Liverpool, was elected hon. auditor, and representatives of the local associations of Birmingham, Bolton, Bradford, Edinburgh, Huddersfield, Hull, Lancaster, Leeds, Lincoln, Liverpool, London, Manchester and Salford, Northampton, Nottingham, St. Helens, Wigan, and Wolverhampton.

The Chairman explained the various clauses in the form of contract suggested by the special committee, to be laid before the committee of the Royal Institute of British Architects, and it was resolved to leave the matter in the hands of the special committee appointed.

The Secretary was instructed to obtain statistics from the members of the local association, as to the fires they have had upon their premises and buildings in course of erection, and what damage has been done during the last five years.

It was resolved that the best thanks of the Association be embodied in an illuminated address, and presented to Mr. S. G. Bird for his valuable services as president during the last four years.

The Association decided to hold its next half-yearly meeting at Bristol.

Messrs. Healey, of Bradford, have prepared plans for the restoration of Bradford parish church.

## NOTES AND COMMENTS.

THE Royal Gold Medal of the Royal Institute of British Architects is to be awarded to Dr. SCHLIEMANN, and the honour has been fairly won. We have endeavoured to point out the errors into which the explorer fell through want of archaeological knowledge, and from allowing his enthusiasm to control his judgment. But we have always tried to do justice to the fervour and self-sacrifice of Dr. SCHLIEMANN. His life is one of the romances of the century. That a youth of the humblest class should be inspired with the idea of discovering Troy, that by perseverance he was able to amass sufficient wealth to enable him to carry out his intentions, and that finally he should have discovered prehistoric settlements in a remote part of Greece, are circumstances which do much to redeem the prosaic character of our time. The treasures which were found have been generously given to his countrymen, and Dr. SCHLIEMANN has had no other reward than fame and the gratification of his aspirations. If he could be persuaded to turn his attention to the discovery of the remains of temples, instead of rude dwellings, he would make architects his debtors.

EVERY visitor to Rouen cannot fail to remember the suspension bridge over the Seine. Like most structures of the kind, it was a pleasing work, owing to the curves of the chains, and was generally introduced into views of the city by English artists. The bridge has disappeared. It was erected in 1836 from the designs of the Brothers SEGUIN, at a cost of 750,000 francs, and, according to the terms of the concession, was to become public property at the end of ninety-nine years. But in one-half that term the bridge (which was only about 20 feet in width) was found to be too narrow to accommodate the trade of Rouen, and it was considered advisable to purchase the proprietary rights, and to replace the bridge by one in stone. The change will involve many alterations in the old Rue Grand-Pont, leading from the bridge to the cathedral. The Rouen suspension bridge would appear to have been formed on a similar principle to that of the Hammersmith Bridge, and both have been fated to disappear about the same time.

THE past year has been the most successful in the history of the Edinburgh Sanitary Protection Association. The number of members at the present time is over 800. Of these about 700 are resident in the town and neighbourhood of Edinburgh, the remainder being country members. About 1,200 inspections have been made during the year, and every member has had the opportunity offered him of having his house inspected since January 1, 1884. The income during the past twelve months has been 1,493*l.* 1*s.* 9*d.*; expenditure, 1,215*l.* 8*s.* 5*d.*; balance, 277*l.* 13*s.* 4*d.*; making, with the balance from last year, a total of 617*l.* 13*s.* 3*d.* A curious case has happened, which may be taken as a precedent. One of the members, having taken a yearly lease of a house in the country from Whit Sunday last, applied in June for an inspection of its drainage and water-supply system. The proprietor, being dissatisfied with the terms of the Association's report, brought an action in the Sheriff Court against the engineer who wrote the report and the council of the Association, seeking for damages in 500*l.* Both the Sheriff-Substitute, before whom the case was first tried, and the Sheriff, to whom it was appealed, gave judgment, with costs, in favour of the Association.

HUNGARY has, by the sudden death of ADOLPHE HUSZAR, lost a sculptor who seemed destined to increase the fame of his country in art. He had hardly reached his fortieth year. HUSZAR belonged to a very poor Slovak family, and from his boyhood he was compelled to depend on the labour of his hands for sustenance. In his seventeenth year he entered PASSER's atelier as a hewer, and there he was filled with a passionate desire to become a sculptor. By studying at night he was able to produce models which gained him assistance from the Government in order that he might pursue his studies. In 1870 he was successful in the competition for the statue of the poet EOETVOES, and it was followed by memorials of other

Hungarian celebrities. His last work was the memorial of the patriot FRANCIS DEAK, which was completed about a month before the sculptor's death. HUSZAR's form was herculean, and he was of a robust constitution.

THE question of ownership of gas and water works was considered by the President of the Society of Engineers in his address on Monday. It was contended that it is doubtful whether any advantage arises from the ownership being undertaken by local authorities. Water being a necessary of life, there is, perhaps, less to be argued against its being so supplied; but in the case of gas it was thought there was no more reason for the supply being in the hands of local authorities than for such bodies to acquire railways, or to undertake the exclusive supply of bread or meat. In describing the experiments for smoke abatement, it was explained that other evils besides those arising from visible impurities of the air are to be found in the London atmosphere.

A STATUE of NICÉPHORE NIEPCE, who, in 1814, invented permanent photography, or, as he called the process, heliography, will be set up in Chalon-sur-Saône in May next. He found that by coating a piece of plated silver or glass with a coating of prepared asphaltum varnish, and exposing it in a camera obscura for about six hours, an image could be developed. Greater sensibility was obtained by DAGUERRE. Afterwards the two chemists entered into partnership, and on the death of NIEPCE, in 1833, his son ISIDORE took his place. The French Government guaranteed a pension for life of 6,000 frs. to DAGUERRE and one of 4,000 frs. to ISIDORE NIEPCE, with reversion of one-half to their widows, to enable them to pursue their studies. It was, in a great measure, by this liberality that the early success of photography was insured. But it deserves to be remembered that THOMAS WEDGWOOD, as far back as 1802, discovered a method of copying paintings on glass and making profiles by the agency of light on nitrate of silver, of which an account was published at the time. But he was unable to give any permanence to the copies.

THE Report of the Nottinghamshire and Midland Merchants and Traders' Association indicates the opinion which men of business now hold about the hazardous speculations of building societies. It is suggested that all building societies ought to be registered, and be subject to the Act of 1874; that proper balance-sheets, according to an approved form, should be issued, and filed with the Registrar of Joint-Stock Companies, in the same way as life assurance companies' accounts now are; that the balance-sheets should be examined and certified by competent auditors, such as experienced accountants or actuaries; and that some limit should be placed to the present dangerous form of balloting for the advance of moneys without interest.

THE supervising architect of the American Government, in his annual report, refers to three conditions, which, under provisions of existing law, operate to the disadvantage of the public service, viz.: 1, the limit of cost of public buildings appears in many cases to have been fixed without sufficient regard to the needs of the public service in cities where the buildings are to be constructed; 2, the appropriations, made from time to time within the limits of cost, are often inadequate for the proper prosecution of the work after its beginning; 3, under existing law, no contract can be made binding the Government to an expenditure in excess of an existing appropriation. During the last year work has been in progress on forty-two new buildings, under the direction of the supervising architect, of which number sixteen have been begun, five completed, and two others practically completed. The year's expenditure on all new buildings, including sites, amounted to 2,772,413 dols. 58 cents; for repairs and preservation of public buildings, 164,102 dols. 32 cents; for heating, hoisting, and ventilating apparatus, and repairs to same, 135,000 dols.; for vaults, safes, and locks, 80,362 dols.; and for storage of silver dollars, 85,402 dols. 32 cents.

## ILLUSTRATIONS.

THE success attained of late years through Europe by Austrian and Hungarian painters has been very remarkable, but it has been mainly in large historical pictures. M. ALBERT HYNNAIS, of Vienna, who now resides in Paris, has shown by his works that an Austrian artist can compete with Frenchmen in that decorative manner which was supposed to have been a special product of Paris. The illustration, which we give from one of M. HYNNAIS's decorative panels, is characterised by a grace that is worthy of his former master, M. BAUDRY.

## NEW WAREHOUSES, CANNON STREET, E.C.

THESE buildings are erected on the north side of Cannon Street, close to St. Paul's Churchyard, for Messrs. SPENCER, WICKS & Co., of Bread Street, on a site formerly occupied by Messrs. CHAS. CANDY & Co.'s warehouse, which has been divided into three portions—one warehouse facing Watling Street, and two fronting Cannon Street. The buildings are of a plain, substantial character, and the front is built of Portland stone. Messrs. MARTIN WELLS & Co., of Aldershot and London, were the contractors, and Mr. GEORGE EDWARDS, of Brompton Road, S.W., the architect.

## HOUSE, EARLEY, NEAR READING.

WE illustrate this week one of the houses on the Earley Estate, near Reading, recently erected for the owners of the property. The estate is about a mile out of Reading, on the brow of a hill, and commands fine views of the town, the Thames valley, and the Oxfordshire hills. The house is built of local red brick, with tile hanging and occasional half-timber work. The principal joiner's work is in pitch-pine, stained and varnished. The accommodation is shown by the accompanying plans. The work has been satisfactorily executed by Messrs. SPEAR & KING, from the designs and under the superintendence of Messrs. CHARLES SMITH & SON, architects, of Reading.

## CHIMNEY-PIECE, ST. GILES'S VICARAGE, NORTHAMPTON.

THIS chimney-piece is of wood, painted in light tones to match the room. The dado shown is of Lincrusta. The long panel over the shelf has a bevelled mirror, and the four small panels have mirrors. The woodwork was executed by Messrs. G. & A. BROWN, Newman Street, London, from the design of the architect for the vicarage, Mr. S. J. NEWMAN, Abington Street, Northampton.

## COTTAGE, DUSTON, NORTHANTS.

THIS is a sketch for a better-class mechanic's cottage proposed to be erected at Duston for Earl COWPER, to cost about 400/. The walls to be of the local stone obtained on the estate, being of a very pleasing colour; the upper portion of the exterior to be covered with brown Broseley tile-hanging, and the roofs with brindled tiles. Mr. S. J. NEWMAN, Northampton, is the architect.

## GATE, SCHAFTOFT HALL.

## YORK ARTS GUILD.

A LECTURE on the "Domestic Life of the Edwardian Period," as shown by its architecture, manners, and customs, was delivered by Mr. Priestley Shires, in the saloon of the York Arts Guilds, Stonegate, on January 29. The lecture was illustrated with measured drawings and sketches, prepared by Mr. Shires. There was a large attendance of members and friends. Mr. J. Watson, the president, presided.

Mr. Shires, after referring to the historical part of the subject, spoke at length on many interesting details, both as regards the plan and character of the houses of the period, and described the purposes for which each room was used, together with the gold and silver plate, tapestry, furniture, &c., &c. Mr. J. W. Knowles, vice-president, proposed, and Mr. G. W. Milburn, seconded, a hearty vote of thanks to Mr. Shires, and after a few remarks from the President, the meeting terminated.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh ordinary meeting of the Institute was held on Monday evening, Mr. Ewan Christian, president, in the chair.

## Award of Prizes, &amp;c.

The PRESIDENT announced that the Pugin Travelling Studentship had been awarded to Mr. W. H. Bidlake, of Leicester, and a medal of merit to Mr. Herbert Osborn Cresswell, of 19 Queen Anne's Gate, Westminster. The Godwin Bursary was awarded to Mr. John Bradshaw Gass, of Bolton, who proposed to visit certain cities in Canada and the United States of America.

## Gold Medal.

The PRESIDENT said the Council proposed to submit to Her Majesty, as the recipient of the Royal Gold Medal, the name of Dr. Henry Schliemann, of Athens, hon. corresponding member, for his excavations at Hissarlik, Mycenæ, Orchomena, and Tiryns, and for his various works describing his discoveries.

Professor KERR made a suggestion that the Council should consider the propriety of awarding another medal of merit to Mr. Maclaren, the third in order in the competition for the Pugin Travelling Studentship.

Mr. CURREY supported this suggestion, and said that, judging the works submitted, it had been matter of difficulty to decide the order of merit between Mr. Cresswell and Mr. Maclaren.

The suggestion was approved of.

Mr. MAURICE B. ADAMS then read a paper on

## Architectural Drawing.

Mr. Adams called to mind that skill in architectural drawing and greatness of treatment in architecture could not be taught or learned by talking of them. He then described the beautiful ideal architect, as sketched in a quaint old French book on architecture in Sir John Soane's library, to show that actual work was better than words, and example of practice better than theories of precept. Acting on this, Mr. Adams said that, aided by several friends and collectors, he had brought together for exhibition a rather comprehensive series of many typical and historically interesting examples of architectural sketching and drawing, including remarkable specimens by Inigo Jones from the Royal Library at Windsor, lent to him by special permission of Her Majesty. Others equally valuable were contributed by the Duke of Devonshire. The series represented most of the names of leading Englishmen to the present day whose drawings characteristically illustrated his subject. They had been selected that he might exhibit side by side some of the best architectural drawings ever produced by students in the English school, and workers in the more recent successive phases or revivals of all the styles, and thus afford a practical lesson such as few essays could possibly give. As to the literature of the subject, Mr. Adams alluded to papers by the late Mr. Burges, A.R.A., Mr. R. Phené Spiers, Professor Donaldson, Mr. H. B. Garling, Mr. Ashpitel, and a paper of his own, "Architectural Illustrations," read at a meeting of the Architectural Association in 1877. Mr. Burges, with an ardent love and masterly knowledge of Mediæval architecture, the thirteenth-century phase of which he always taught them to admire, described characteristic examples of Mediæval drawing, and advocated, as consequent upon the progress of the Gothic revival, the use of a similar style of bold outlining, and which he himself so charmingly adopted in his drawings. With still greater force he urged the necessity of learning to delineate the figure and animal forms. Mr. Phené Spiers, a most successful student from Paris and an authority of considerable experience at home, with equal devotion to his art, claimed for the modern French system of shadows and tints many advantages. For his own part, Mr. Adams confessed to a decided preference for the individual character and personal freshness peculiar to English drawings, and while admiring the French mode, he should be sorry to see it adopted literally here. Despite of disadvantages, or possibly failings, English architectural education and draughtsmanship had made remarkable progress in the past few years. Moreover, the public interest taken in architecture and the higher forms of architectural delineation had increased and become more widespread. As a set-off against this, owing to the increased struggle of modern daily competition, there was a scamped and hurry-scurry work done under pressure, and further, mountebank performances of acrobatic draughtsmen and designers meant only to attract, men whom Mr. Ruskin had described with pungent terseness. Drawing, if not the chiefest qualification for an architect, was certainly of paramount importance to him. This assertion might seem uncalled for, had it not of late become the shibboleth of a would-be advanced art party to decry and discredit good drawing. This negative view had taken a very tangible form, and a well-known member of the Institute, who had put up more buildings of a kind in London than any other architect living, told him but

the other day that one reason why the Royal Courts of Justice were in his opinion so miserable a failure, was because Street was such a splendid draughtsman. No better protest against such theories could, he thought, be offered than the works exhibited that night, including such names as Inigo Jones, Carter, Pugin, Barry, Cockerell, Street, Burges, Ruskin, Nesfield, Norman Shaw, Ernest George, E. W. Godwin, &c. Sir Edmund Beckett, who had been described elsewhere as "our only British architect," once told him, and he was not surprised to hear it, that he was not much of a draughtsman. Sir Edmund Beckett was supposed to be a leader of public opinion in regard of the failings of architects generally. "Architects," said the public, "are all very well to make pretty drawings, but only those who venture on ground that angels fear to tread court failure or waste money by attempting to realise their pictures in bricks and mortar." Though the criticism was untrue in a general sense, it was perhaps not so wrong as persons in the profession might imagine, for half the troubles of an architect were due to careless drawing and slipshod preparation of details. Without good draughtsmanship it was impossible to convey your ideas to the workman. Good drawing was the secret of much of Mr. Street's success as well as the leading beauty of his versatile designs; but it must be remembered that it was long practice that had won him the dash and cunning of his mature hand. Mr. Street's chief lesson was good, honest, hard work, and the same was the point emphasised by the entire collection of drawings. Most were private studies drawn not as pictures merely, but simply to record and impress on the mind the architecture thus delineated. Architects could not draw too well for the purposes of their art. The architect's object was the erection of buildings, and not merely the elaboration of drawings of them. Sketches and measured work were made with the view of storing his mind with knowledge and cultivating his taste. His preliminary drawings and designs for his clients should illustrate his proposals in the best and most easily understood form, and his working plans and contract details show actually to precise scale the designs resolved on for execution. Architectural drawing also included the more advanced and elaborated studies made for exhibition, or for the illustration in perspective of either ancient or modern buildings, schemes for decoration, and details of ornamental design. Each of these divisions was as necessary to good work as the other, and no good architect could afford to neglect them.

Mr. Adams referred at some length to the examples of architectural drawings that were exhibited. In connection with Sir Charles Barry the name of the great Augustus Welby Pugin, the master, if not the father, of the Gothic revival, he said must always be associated. As a strictly technical draughtsman, Pugin was not only by far the most able, but also the most voluminous of his day, while his figure drawings and artistic powers as a water-colour artist were even now almost unsurpassed by architects. Pugin was generally supposed to have drawn in a hard, cold manner and unsympathetic style, but a study of his autograph drawings would at once show what a false impression was given by his published works. The original drawings for his "Book of Examples," executed by himself, Joseph Nash, B. Ferrey, and F. T. Dollman, were many of them as spirited as they could be, and quite unlike the cast-iron backlined renderings seen in the books themselves. Mr. Adams remarked that no list of modern examples of drawing would be complete without the presence of M. Viollet-le-Duc, and so he had borrowed from Mr. Wethered an original pencil drawing showing the Romanesque church at Saintes, while the memorial book of autograph facsimiles was in the Institute Library. From Mr. Phéné Spiers also he had a drawing by Professor E. Brune, giving a "Study of Superimposed Orders," which, with Mr. Spiers' "Study of Design," executed in Paris, well represented the French style of architectural drawing he had alluded to.

Professor KERR proposed a vote of thanks to Mr. Adams. A more interesting collection of drawings had, he said, never been presented to the profession, and a more interesting description of them had never, as far as he knew, been given. Mr. Kerr said he remembered his old friend Allom reading a paper on "Representations of Buildings," and he was afraid to say how many drawings he presented to be hung for the occasion, all of them executed that day. "I remember," said Mr. Kerr, "he looked at a very large drawing of mine, which I had done in my best manner, but it was not sufficient, and Allom said, 'Oh, for half an hour at it!'" That would have been sufficient for him. Mr. Kerr said he preferred the present style of drawing almost to Allom's, and this showed the way popular drawings of the time laid hold of one.

Mr. COLE A. ADAMS, in allusion to the collection of drawings, said that the crowded state of the room showed that the art side of the architect's profession always elicited their sympathies. He noticed that drawings of Frederick Deshon hung beside those of his master, the late Mr. Street. Street's idea had been that Deshon was the only man in London who knew how to draw. Mr. Adams seconded the vote of thanks.

Mr. ALFRED WATERHOUSE, A.R.A., said he rejoiced to see the crowded state of the room for once, and so many of the profession enjoying the treat which had been set before them on the walls, as well as the admirable discourse they had had on drawing. He was pleased to hear the practice of sketching had been enforced. English architects differed from their Continental brethren by making perspectives. In our dark climate perspectives had the advantage over other drawings.

Mr. JOHN HEBB doubted the identity of Inigo Jones's hand in some of the drawings.

Mr. AITCHISON, A.R.A., thought the last speaker was under a mistake as to Inigo Jones. Jones, though we called him an architect, was a painter-architect, but not a constructor. Wren was architect and draughtsman; he was the Michel Angelo of this country. The collection of drawings exhibited was the finest he had ever seen, and with Mr. Adams's remarks on drawing he thoroughly agreed.

Mr. R. PHENE SPIERS said Mr. Adams had somewhat misunderstood the tenor of his (Mr. Spiers's) paper, and confounded his remarks on drawing with those on education. In France, Germany, and Holland elevational drawings had tinted shadows projected at an angle of 45 deg., to show the relative proportions of one part of a building to another. They showed at a glance the depth one part projected beyond the other, and the principle was carried into details, capitals, &c. It was impossible, he held, to study a Classical elevation properly without having the shadows projected. Certain definite advantages were gained by this, and you could tell from remarks passed in German and French picture exhibitions that the public understood the meaning of the shadows, and formed their judgment of the pictures accordingly. He had been anxious to see this in England. Perspectives, unlike elevations, were, however, more difficult to make and more difficult to understand. Mr. Street discouraged the principle. Mr. Street, he thought, did not understand it, for he once told the Academy students that the shadows were projected at an angle of 45 deg. on the north side of a building. Mr. Spiers said the principle was tried once in the competition for the Tite prize, but he had never wished to see the experiment repeated. The drawings of the Royal Academy School were made merely in outline with a firm hand, and untinted. No one, however, would have imagined the improvement that had taken place during the last ten years in England as regarded the work of the typical English architect. Professor Kerr had anticipated his remarks concerning Tom Allom, who was the first architect to whom for a short time he went. He remembered the wonderful celerity with which he made his drawings, and though Professor Kerr doubted whether they would go down at the present day, he thought they were the finest competition drawings ever made. He had seen drawings turned out by Allom in about three hours' time, and more should not be required in competition work. It was to be regretted that such an amount of time should be wasted when so much more effect could be obtained by use of the brush, by sepia drawings, than by pen and ink. Cockerell's perspectives were, he thought, finer than any drawings, either English or French, and his skill in drawing and in grouping he considered altogether unequalled. After referring to Professor Brune and Mr. Street, Mr. Spiers remarked that Mr. Waterhouse's drawings would mark an epoch in English architecture, and said that any artist might envy Mr. Waterhouse's ability, as they were drawings done by a person who might be supposed to have nothing else to do but use the brush. As to the inauguration of the additional room at the Royal Academy, now made available for architectural drawings, Sir F. Leighton had expressed to him the hope that it would be well filled by architectural works. Drawings would have to be sent by Friday, Saturday, and Monday March 27, 28, and 30.

The PRESIDENT said their most enthusiastic thanks were due to Mr. Adams for his paper, and for getting together the wonderful collection of drawings exhibited, and that their most cordial thanks were due to Her Majesty and those who had contributed.

Mr. ADAMS acknowledged the compliment, and the proceedings terminated.

## ARCHÆOLOGY IN ROME.

THE inaugural meeting of the British and American Archæological Society has been held in Rome. The opening addresses were delivered by the English Ambassador and the United States Minister, the vice-presidents of the society. Sir John Savile Lumley explained at length on the exceptional opportunities afforded at the present time for archæological studies in Rome by the excavations carried out on behalf of the Government, and by those which are a consequence of the extensive building operations in progress. He gave an interesting description of the enormous stores of objects found—such as hundreds of lamps, sacks of coins, inscriptions, pieces of sculpture, and architectural fragments of beauty, still

awaiting examination and study—and of the museum which was being prepared for them.

Mr. W. Waldorf Astor, the American Minister, speaking on the importance and direction of archæological researches, expressed a hope that the studies of his countrymen in Rome would lead them, on returning home, to further the investigation of that important field of inquiry which America offered in the vestiges and traces of civilisation, dating anterior to the foundation of Rome, when adventurous Phœnician sailors put out for the Isle of Atlantis, and tribes made their way from Europe across Behring's Strait.

Mr. F. M. Nichols, F.S.A., then gave an interesting review of the results of the Roman excavations since the days when everything led to controversy, and spoke of what future excavations might be expected to reveal. Finally, the honorary librarian gave a description of the Mediæval tower of the Anguillara, about to be demolished in the course of the Tiber improvements, and an historical sketch of the powerful baronial family to which it had belonged.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### MR. RUSKIN'S FIRST ARTICLE.

MR. RUSKIN was born in February 1819, and some notes on natural history by him appeared in the *Magazine of Natural History* in 1834, and in the year following there were verses in one of the annuals. The first of Mr. Ruskin's writings on architecture was the article below, on "The Poetry of Architecture," which was printed in the *Architectural Magazine* in November 1837. It is not only remarkable from its style and as the production of a writer who had not reached his nineteenth year, but it foreshadows the principles which Mr. Ruskin insisted on afterwards in his larger works, and especially through the importance given to the emotions as a test of architectural effect:—

The science of architecture, followed out to its full extent, is one of the noblest of those which have reference only to the creations of human minds. It is not merely a science of the rule and compass; it does not consist only in the observation of just rule or of fair proportion; it is, or ought to be, a science of feeling more than of rule—a ministry to the mind more than to the eye. If we consider how much less the beauty and majesty of a building depend upon its pleasing certain prejudices to the eye, than upon its rousing certain trains of meditation in the mind, it will show in a moment how many intricate questions of feeling are involved in the raising of an edifice; it will convince us of the truth of a proposition, which might at first have appeared startling, that no man can be an architect who is not a metaphysician. To the illustration of the department of this noble science, which may be designated the poetry of architecture, this and some future articles will be dedicated. It is this peculiarity of the art which constitutes its nationality; and it will be found as interesting as it is useful, to trace in the distinctive characters of the architecture of nations not only its adaptation to the situation and climate in which it has arisen, but its strong similarity to, and connection with, the prevailing turn of mind by which the nation who first employed it is distinguished.

I consider the task I have imposed upon myself the more necessary because this department of the science, perhaps regarded by some who have no idea beyond stone and mortar as chimerical, and by others who think nothing necessary but truth and proportion as useless, is at a miserably low ebb in England. And what is the consequence? We have Corinthian columns placed beside pilasters of no order at all, surmounted by monstrosified pepper-boxes Gothic in form and Grecian in detail, in a building nominally and peculiarly national; we have Swiss cottages, falsely and calumniously so entitled, dropped in the brickfields around the metropolis; and we have staring, square-windowed, flat-roofed gentlemen's seats, of the lath and plaster, mock magnificent, Regent's Park description, rising on the woody promontories of Derwent Water. How deeply is it to be regretted, how much is it to be wondered at, that in a country whose school of painting, though degraded by its system of meretricious colouring, and disgraced by hosts of would-be imitators of inimitable individuals, is yet raised by the distinguished talent of those individuals to a place of well-deserved honour; and the studios of whose sculptors are filled with designs of the most pure simplicity, and most perfect animation; the school of architecture should be so miserably debased! There are, however, many reasons for a fact so lamentable. In the first place the patrons of architecture (I am speaking of all classes of buildings from the lowest to the highest) are a more numerous and

less capable class than those of painting. The general public, and I say it with sorrow because I know it from observation, have little to do with the encouragement of the school of painting, beyond the power which they unquestionably possess and unmercifully use, of compelling our artists to substitute glare for beauty. Observe the direction of public taste at any of our exhibitions. We see visitors—at that of the Society of Painters in Water-Colours—passing Taylor with anathemas and Lewis with indifference, to remain in reverence and admiration before certain amiable white lambs and water-lilies, whose artists shall be nameless. We see them, in the Royal Academy, passing by Wilkie, Turner, and Callcott with shrugs of doubt or of scorn, to fix in gazing and enthusiastic crowds upon kettles full of witches, and His Majesty's ships so-and-so lying-to in a gale, &c., &c. But these pictures attain no celebrity because the public admire them, for it is not to the public that the judgment is entrusted. It is by the chosen few, by our nobility and men of taste and talent, that the decision is made, the fame bestowed, and the artist encouraged. Not so in architecture. There the power is generally diffused. Every citizen may box himself up in as barbarous a tenement as suits his taste or inclination; the architect is his vassal, and must permit him not only to criticise but to perpetrate. The palace or the nobleman's seat may be raised in good taste and become the admiration of a nation, but the influence of their owner is terminated by the boundary of his estate; he has no command over the adjacent scenery, and the possessor of every thirty acres around him has him at his mercy. The streets of our cities are examples of the effects of this clashing of different tastes; and they are either remarkable for the utter absence of all attempt at embellishment or disgraced by every variety of abomination. Again, in a climate like ours, those few who have knowledge and feeling to distinguish what is beautiful are frequently prevented by various circumstances from erecting it. John Bull's comfort perpetually interferes with his good taste, and I should be the first to lament his losing so much of his nationality as to permit the latter to prevail. He cannot put his windows into a recess without darkening his rooms; he cannot raise a narrow gable above his walls without knocking his head against the rafters; and, worst of all, he cannot do either without being stigmatised by the awful, inevitable epithet of "a very odd man." But, though much of the degradation of our present school of architecture is owing to the want or unfitness of patrons, surely it is yet more attributable to a lamentable deficiency of taste and talent among our architects themselves. It is true that in a country affording so little encouragement, and presenting so many causes for its absence, it cannot be expected that we should have any Michel-Angelo-Bonarottis. The energy of our architects is expended in raising "neat" poor-houses and "pretty" charity-schools, and if they ever enter upon a work of a higher rank economy is the order of the day; plaster and stucco are substituted for granite and marble, rods of splashed iron for columns of verd-antique; and, in the wild struggle for novelty, the fantastic is mistaken for the graceful, the complicated for the imposing, superfluity of ornament for beauty, and its total absence for simplicity.

But all these disadvantages might in some degree be counteracted, all these abuses in a great degree prevented, were it not for the slight attention paid by our architects to that branch of the art which I have above designated as the poetry of architecture. All unity of feeling (which is the first principle of good taste) is neglected: we see nothing but incongruous combinations; we have pinnacles without height, windows without light, columns with nothing to sustain, and buttresses with nothing to support. We have parish paupers smoking their pipes and drinking their beer under Gothic arches and sculptured niches, and quiet old English gentlemen reclining on crocodile stools and peeping out of the windows of Swiss chalets.

I shall attempt, therefore, to endeavour to illustrate the principle from the neglect of which those abuses have arisen; that of unity of feeling, the basis of all grace, the essence of all beauty. We shall consider the architecture of nations as it is influenced by their feelings and manners, as it is connected with the scenery in which it is found, and with the skies under which it was erected. We shall be led as much to the street and the cottage as to the temple and the tower; we shall be more interested in buildings raised by feeling than in those corrected by rule. We shall commence with the lower class of edifices, proceeding from the roadside to the village, and from the village to the city; and if we succeed in directing the attention of a single individual more directly to this most interesting department of architecture, we shall not have written in vain.

**Erratum.**—A paragraph in last week's *Architect* stated that Mr. Ellice Clarke had been appointed county surveyor for Sussex. It should have been "a county surveyor." Mr. Clarke is appointed to the western division, but the eastern division of Sussex for upwards of thirty years has been in charge of Mr. Henry Card, C.E., Lewes.

#### Borough of Croydon Street Improvements Competition.

SIR,—We have been asked by some architects who signed the agreement not to compete unless an assessor was appointed, as to whether the above competition came under the terms of that agreement. After careful consideration of the published conditions, we are of opinion that it is architectural in character, and that architects who signed the said agreement cannot, consistently with the terms of it, compete in this one, as we are officially informed that no assessor will be appointed. If you can give publicity to this letter we shall consider it a favour.

Yours obediently,

(Signed) HENRY CURREY, Chairman.  
 COLE A. ADAMS, } Hon. Secs.  
 ASTON WEBB, }

February 4, 1885.

#### Architectural Drawings.

SIR,—As the late Mr. Bloré was mentioned among the several artists by Mr. Adams in his lecture of Monday last, I should like to state that the working drawings of Lambeth Palace, made by Mr. Bloré, are preserved in the Archiepiscopal Library, which is open daily, Saturdays excepted. There are also two fine water-colours, by Paul Sandby, R.A., of the old gates of Canterbury, among the Kentish collection of prints and drawings, to which notice is invited, and assistance asked in completion.

As an example of the unexpected whereabouts of art, there is here, in the margin of MS. No. 1,106, a pen-and-ink sketch of the west end of St. Paul's Cathedral in the fourteenth century.

Faithfully yours,

February 4, 1885.

S. W. KERSHAW, F.S.A.

#### The Professional Education of Architects.

SIR,—The discussion which recently took place at the Architectural Association is not without interest to the profession at large. From the remarks of the President, at the discussion which recently took place at Conduit Street, it may be gathered that a special committee has been, and is, busily engaged in considering how the educational work carried on by the Association may be rendered, if possible, more effective and useful to the members. This is a wise step, and much good may result from such an inquiry. All who are interested in the Society have been invited to state their views, and to contribute towards the desired end, so that, as far as possible, all interests may be considered, and no hole-in-corner reforms instituted.

Civilisation moves very quickly in these days of steam and electricity, and, with the keen competition which is such a characteristic of our times, it is apparent that the architectural profession has great need to see that it is armed for the conflict. The profession owes a debt of gratitude to the Architectural Association for the wisdom displayed by the founders, and the unselfish manner in which, year after year, those desirous of helping in the work of education, voluntarily come forward and give their services. A glance at the balance sheet yearly published shows at what a very small cost the large amount of work is carried on; and when it is considered that the Institution now numbers over a thousand members, those acquainted with the working-cost of like societies, will appreciate the sacrifice demanded from the active officers in the Association, and the great money-saving they effect by their honorary services. The committee merit success in their labours of readjusting and improving their machinery. The principles upon which the Architectural Association has hitherto worked should be maintained and, let us hope, strengthened and enlarged.

The examination for admission to the Royal Institute of British Architects was undoubtedly a step in the right direction, and, as time goes on, we may see a yet more stringent test applied, and that architects seeking to be admitted as Fellows shall be obliged to show cause why that honour should be conferred upon them. Let it be an understood thing that admission to the Institute requires something more than to be proposed and seconded, and the honour will be sought after; and, if the Institute becomes more alive to the wants of the profession, its influence will be greater, and its voice better listened to. From some cause or other, there is a want of touch and sympathy now existing between the council, the members, and the profession at large, which those who have the desire for greater unity at heart should try to overcome. We believe the council desirous, individually, of establishing a feeling of confidence; but as a body they procrastinate over necessary reforms, and, to all appearances, spend too much time over

matters of trifling interest, which in their own offices would be promptly dealt with. The remedy for much of this will probably be found, if the alterations which have been proposed in relation to the charter are carried out. More elasticity is required, and more of the vigour which characterises the executive of the younger society. Most are ready to give the council full credit for a desire to see the Institute made more popular and representative, and should they extend the franchise, the new voters will give renewed strength to the council, and infuse into the whole body the warmth of younger blood.

Returning to the subject of the examination, let us consider how it is to be prepared for. Students can attend the very useful courses of lectures at King's College and University College, and in the Architectural Association they will find opportunities presented for enabling them to learn some of the many branches of their profession. But the Architectural Association does not go far enough in its teaching. Whether the authorities in the scheme now under consideration will see their way to extend their system has yet to be seen; that they should do so is, in the interests of the Association, to be desired. The failure now to be found in the working of the Association arises chiefly from the fact, that instruction in the scientific branches is not so thorough in its character and so far-reaching as it might be made.

On looking through the Brown Book, it is found that, beyond the two courses of lectures on the History of Architecture and Construction, no special instruction is given in such subjects as warming, lighting, ventilation, or in sanitation, ornament, mouldings, &c., their origin, kind, *motif*, suitability for modern adoption, and the rational use they may be put to, with examples of the various kinds calculated to impress and fasten the student's attention. Again, there is no mention of any defined course upon the many materials which the student ought to know about: their strengths, nature, compositions, durability, causes of decay, &c.—questions which force themselves upon the practitioner in some form or other every day. Estimating and quantities are not taught. The chemistry of building materials apparently finds no place now in their curriculum. Perspective, stereotomy, and such-like studies are not included either. Thus it will be seen that the student of to-day, though much better off than those who went before him, still needs those sources of instruction provided for him, if he is to hold a high place in his profession and in society.

To teach many of these subjects requires the knowledge and experience of older men, who are besides capable of imparting what they know to others. It is hardly to be expected that, relying only on honorary and voluntary help, the Architectural Association can provide such instruction; but there is no reason why the suggestions thrown out by the President at the discussion which took place the other evening should not be carried into execution. If the Institute demands the test of an examination, the council should contribute towards the means for passing it, either by organising a course of instruction themselves or by granting a sum of money to the Architectural Association, unhampered by any conditions beyond those of a statement from the committee showing how the money has been spent.

Were the committee of the latter body in possession of funds, they might easily supplement their present work by classes and lectures with some paid teaching, and so add increased usefulness to their Society. It is difficult to see any reason against adopting such a course. The Association has done good service in the past; it must take a fresh departure now with the times, or it may find, in default, that what it does not give, will be provided in other quarters, and its classes and members suffer in consequence. Competent men can surely be found, who, for moderate fees, would undertake to teach those subjects which are not taught now, and the Association, would gain in prestige. We trust good counsel will prevail, and that no feelings of rivalry and jealousy will interfere should the older Society offer aid to the younger. The most harmonious good feeling now exists, and may be strengthened, conferring benefits on both institutions, and extending them to the profession generally. The scale of requirements and acquirements has risen in every walk of life, and architects must go with the times, or find themselves elbowed away by outsiders.

Individual men in any profession will work their way to eminence, apart from any organised system of teaching, but would generally be the better for having had it. But it is the general body who need to be systematically taught—the men who are pouring into the profession who need properly educating. The amount of ignorance existing among many architects, of even the rudiments of their calling, tells most injuriously upon the reputation of the profession generally, and it is only by demanding some test of competency that this can in any way be checked.

Let the public learn that in employing a member of the Institute they have some guarantee of competency, and men

will qualify themselves for membership. It is not to be supposed for a minute that to pass the examination is the "be all and end all here" of an architect's aim; but it is something towards it. As time goes on, the requirements of the Institute for admittance will become greater, and perhaps at no very distant date we may see architecture a diplomated profession, and a college established for the thorough and systematic training of its members. In the meantime, something may be done. Let that something only be taken up with the determination to do it as thoroughly as circumstances will allow, and fearlessly. The profession has slumbered long enough; something more than making pretty artistic drawings is necessary, and if art cannot be taught, but is inborn, as we are so often told, it may be developed, and, in fact, must be, by systematic study; and science, its twin sister, must be most assiduously courted by him who wishes success. Neither sister can be won without a life of serious devotion, or any success achieved without showing that it is merited.

KNOWLEDGE IS POWER.

## LEGAL.

### Queen's Bench Division.—Feb. 2.

(Before MR. JUSTICE GROVE and MR. BARON HUDDLESTON.)

SILSBURY v. ISLE OF WIGHT SANATORIUM COMPANY.

#### ARCHITECT'S CERTIFICATES.

In April 1884 a contract was entered into with the plaintiff, who is a builder, for converting a building at Blackgang, Isle of Wight, into a sanatorium. The amount was 1,246*l*. There were the usual clauses in the deed that extra works were to be authorised by the architect, that his final certificate was necessary, and that in case of dispute it should be referred to him, and his decision was to be taken as final. The contract and extra works were duly completed in last August. Certificates were given in November by the architect, one for a balance of 225*l*. arising out of the contract, the second for 357*l*. for additional works, and the third for 113*l*. for works out of the contract. The plaintiff was paid 100*l*. on account, as the directors were not in a position to pay the whole. It was arranged that there should be an inspection of the particulars of the extra works. In the inquiry some differences arose, and an action was accordingly brought to recover the balance due on the certificates, and it was put on the part of the plaintiff, the contractor, as a clear case in which under the architect's certificates he must be entitled to recover, and in which, therefore, he was entitled to summary judgment under "Order XIV.," the order giving a power of summary judgment in cases in which there is no defence. A Judge at Chambers, however, gave leave to defend the action, and this was an appeal by the plaintiff against that decision. The affidavits on the part of the defendants stated that the prices were too high, and that if these were considered and penalties for delay were allowed there would "scarcely remain anything due." But the defendants did not state that they had ever objected to the architect that his certificates were wrong.

Mr. Charles, Q.C., submitted that the plaintiff's case was clear, and that there could be no defence against the architect's certificates showing the sums claimed to be due.

Mr. Justice Grove: But what the contract says is not that the certificate shall be final, but that the decision of the architect on any dispute between the parties, which is to be referred to him, is to be final. Is not this a "dispute" which ought to be referred to him?

Mr. Charles: It is in effect decided by his certificates given.

Mr. Justice Grove: Is there not a "dispute" arising upon his certificates?

Mr. Charles: How can there be, as his certificates are to be final?

Mr. Baron Huddleston: That is not the contract, but his "decision" on a "dispute" is to be final, and he could not decide without hearing the parties on the "dispute."

Mr. Charles: The only dispute that can arise is as to whether he ought to have given his certificates, and it is provided that on his certificates the moneys shall be payable.

Mr. Baron Huddleston: If there is a dispute between the parties they are entitled to be heard upon it; and it does not appear that, upon the certificates, the parties have been heard by him.

Mr. Charles: That is the fault of the defendants, who ought to have objected to the certificates being given. (He cited a case of *Goodyer v. Corporation of Weymouth* to the effect of his contention in 35 *Law Journal Reports*, Common Pleas, but the Court said the point had not been taken in that case.) What is there to decide if the certificates are rightly given?

Mr. Baron Huddleston: Suppose a mistake in addition, making a large sum due which is not due? Is there to be no means of correcting it?

Mr. Justice Grove: Is the certificate to be in any case final, though the contract says it is not to be so?

Mr. Charles: That would be a case of misconduct, and no doubt it might be corrected. But that is not this case.

Mr. Justice Grove: Suppose a mistake in the measurements?

Mr. Charles: In this case there has been a general payment on account, and an acknowledgment that the money has been spent on other matters.

Mr. Baron Huddleston: That is not material now, for the question is whether the certificate of the arbitrator is final.

Mr. Charles: Surely after such an admission and a part payment the defendants ought not to have unconditional leave to defend the action?

Mr. Justice Grove: The most satisfactory course would be to refer the case back to the arbitrator.

Mr. Charles: In the 26 *Law Times*, p. 763, is a case which shows that the certificates are final.

Mr. Justice Grove said that case was different from this, as there it was only provided that the engineer should certify that the work was done. Here there is a provision that the arbitrator is to decide any dispute between the parties.

Mr. Charles: The defendants ought to have gone to the arbitrator, either before he gave his certificates or immediately upon their being given, and asked him to review his decision.

Mr. Baron Huddleston: That seems to be an answer to the argument that the arbitrator is to decide any disputes between the parties. You say that the defendants ought to have raised a dispute by objecting to the certificates. I do not find on the affidavits any statement that they had so objected.

Mr. Charles: No; there is no such statement and could not be; yet the action was not brought until a month after the certificates.

Mr. Bompas, Q.C., for the defendants, the company, said to refer the case back to the arbitrator would not be very satisfactory to them.

Mr. Justice Grove: Because he has already decided against you.

Mr. Bompas: On account of his having given his certificates as he did, he would naturally be inclined to uphold them. It was enough, surely, that there was a substantial question to be decided between the parties, and a Judge at Chambers had held that there was such a question. There were two questions here: whether in law the architect's certificates were conclusive; and whether, in fact, if that were not so, the money was really due. Now as to the question of law the certificates were not final and had not indeed been given on the questions now raised. The defendants put forward an affidavit that, on a proper investigation of the accounts, nothing more would be found due to the contractor, and the contractor, relying on the certificates, did not swear that anything was now due. Surely the defendants ought to be let in to contest the matter and defend the action.

At the conclusion of the second day's hearing the Court asked when the case was to be tried, and were told that it was to be tried at Winchester next week. They then said that they thought that if 400*l*. were paid into Court the company might be let defend.

Mr. Justice Grove said, in announcing this decision, that there was a difference of opinion between himself and his brother as to whether the company ought to have leave to defend, and under the circumstances the order suggested was the best that could practically be adopted.

Mr. Baron Huddleston agreed in that view as the practical result. He differed with his brother as to whether there ought to be leave to defend, but would not insist on his view, especially as the only result of his doing so would be that the order of the Judge would stand.

### High Court of Justice.—Chancery Division.—Feb. 3.

(Before MR. JUSTICE KAY.)

#### BULLERS v. DICKINSON.—LIGHT AND AIR CASE.

The plaintiff in this case, a builder, was the owner of certain houses on each side of Gilbert Court, a *cul-de-sac* situate at right angles to the north side of Jacob Street, Bermondsey. On the west side of the court there were four houses—Nos. 1, 2, 3, and 4 Gilbert Court—No. 1 being the nearest to Jacob Street; and on the east of the court was a house, No. 1, Jacob Street, which fronted that street and presented its side to the court. Jacob Street was now 24 feet wide, and No. 1 stood on part of the site of an old toll-house which was pulled down about nine years ago. The frontage of the old toll-house, which was a wooden house three storeys high, inclined forward at an angle into Jacob Street, and when it was pulled down the then owner sold that part of the site which projected into Jacob Street to the Vestry of Bermondsey for the purpose of widening and straightening the street. He then erected the present No. 1 Jacob Street, a brick building one storey high, carrying back the frontage to the line of the rest of the street. This new building, which was used as a shed for storing iron, had a window in it occupying,

according to the evidence, a portion of the corresponding space of an ancient light in the old house, but situated in a wall not built in the same plane as or parallel to the old wall, but set further back, 7 feet at one end and 4 feet at the other. The defendant had erected on the opposite side of Jacob Street a large building 57 feet high, and the only question of novelty in the case was whether, under these circumstances, the ancient light of the ground-floor window of No. 1 Jacob Street had been lost or abandoned. With regard to the houses Nos. 1, 2, 3, and 4 Gilbert Court, the chief defence was that there had been no material diminution of the access of light and air; and on the one side a number of people in a humble station of life, who occupied tenements in the court, deposed to their own actual experience of the loss of light; while on the other there was the evidence of certain experts that no material diminution of light or air could have taken place, and one of these witnesses gave evidence that, having regard to the class of people who inhabited the court, there was as much light as they could expect. The hearing of the case has occupied nearly three days.

Mr. Justice Kay delivered judgment, in which he recapitulated the evidence and referred to the authorities. As to the loss or abandonment of the ancient light in No. 1 Jacob Street, he said that the burden of proof lay on the defendant to show this, and he had not discharged it. If only the part of the old house which projected had been pulled down, and a wall, built across the remainder of the site, with a light in it, had been erected, leaving the rest of the old house standing, it could not have been said that the light had been abandoned; and there was no difference in principle between this and what had been done. The projecting piece had been parted with expressly that it might not be built upon, but thrown into the street, and the new No. 1 had been built without any delay. Nor was the smallness of the present room on the ground floor of No. 1 material, as had been argued. Upon the other points his lordship was satisfied that the defendant's huge building did interfere with the access of light and air to Gilbert Court; and, after commenting severely upon the evidence of some of the expert witnesses, and observing that the question was not what the class of persons were who inhabited the houses, but whether the light to which they were entitled was or was not materially diminished, he ordered the defendant to pay 200*l.* damages within a month, and, if this were not done, declared that the defendant's building materially interfered with the plaintiff's light, and gave him liberty to apply to the Court to give effect to that declaration, the defendant to pay the costs of the action.

#### Manchester Assizes.—Jan. 29.

(Before MR. JUSTICE DAY).

MITCHELL *v.* SHEPLEY.

ARCHITECT'S COMMISSION.

This action was brought by Mr. Thomas Mitchell, F.R.I.B.A., against an alderman of Oldham, to recover 54*l.* balance of commission. The question in dispute was whether the plaintiff was entitled to 5 per cent. or 2½ per cent. commission. The defendant contended that he was only entitled to 2½. In May 1882, the defendant instructed the plaintiff to draw plans for fifteen houses which he proposed erecting on a plot of land at Oldham. The plans were drawn and approved by the Borough Surveyor on July 2, and quantities were taken out in the ordinary way. Plaintiff said that nothing was ever suggested that he should receive less than the usual commission, except on one occasion in June, when the defendant said that as he was a member of the Town Council, vice-chairman of the Board of Guardians, and without doubt the future chairman, he ought to reduce his terms, as he would give him his influence in connection with Corporation work and the new workhouse schools that were then projected. Plaintiff replied that he could not reduce his terms to him (the defendant) without reducing them to others, but that if he carried out his suggestion he should be quite prepared to give him discount equal to 2½ per cent. The defendant indignantly denied ever having made this offer. Plaintiff said that since this conversation took place the defendant had said once or twice that he should expect the work to be done at a lower rate. He said he could bring several members of the Board of Guardians and the clerk to prove that he had used his influence. The defendant's version of the agreement as to terms was that as he had heard that the plaintiff was in the habit of having the quantities taken out in Manchester, and not by his clerks at his own office, he declined to pay 2½ per cent. for the quantities. He said he told the plaintiff that he only intended to pay 5 per cent. on the whole work. The plaintiff at first demurred to that arrangement, but afterwards accepted 5 per cent. for the whole work. Defendant denied having promised the plaintiff to use his influence for him in the Town Council and in the building of the workhouse schools. The Judge directed the jury to consider whether a contract was definitely entered into when the defendant gave instructions for the drawing of the

plans, remarking that if a legal contract was then made, it could not be affected by the subsequent conversations. The jury returned a verdict for the plaintiff for the full amount claimed.

#### GENERAL.

**M. G. J. V. Clairin** has completed a series of water-colour drawings of the principal scenes in the drama of "Theodora," which is attracting immense audiences every night to the Porte St.-Martin Theatre.

**An Exhibition of Eastern Art**, comprising Persian, Rhodian, and Damascus works from various private collections, will be held in the Burlington Fine Arts Club during March and April.

**A New School of Art** is about to be erected in Lincoln, and is expected to be opened by December 1.

**Dr. John Evans, F.R.S.**, in a late address to the Archaeological Society at St. Albans, condemned the work now carried on by Sir Edmund Beckett at the cathedral. It was said that great damage had been done in dealing with the ancient work of John of Wheathamstead, and it was regretted that the society was not stronger, in order to withstand the unchecked vandalism, for it could be called nothing else, by which so much ancient and valuable work had been destroyed.

**The King of the Belgians** has approved of the election of M. H. Hymans as a titular member of the Royal Belgian Academy of Fine Arts.

**The Private View** of the Spring Exhibition of the Nineteenth Century Art Society, at the Conduit Street Galleries, will be held on Saturday next, and the exhibition will be open to the public on the following Monday.

**The Surplus** of the Health Exhibition will amount to about 19,000*l.*, but it is not to be disposed of until the financial success of the Inventions Exhibition shall be secured.

**M. Franceschi** has completed a bust of Her Royal Highness the Countess de Paris, which will be exhibited at the next Salon exhibition.

**Professor Baldwin Brown** will read a paper on "Gottfried Semper and his Theory of Architecture" at the meeting of the Edinburgh Architectural Association on Monday next.

**Mr. John Jones**, art metal worker of Walker's Croft, Manchester, has just supplied the whole of the casements and lightning-conductors used in the new town-hall at Hyde, near Manchester.

**Mr. John Graham** has lent to the Glasgow Institute of Fine Arts Gainsborough's picture of *The Sisters*, Turner's *In the Scheldt*, and Ary Scheffer's *St. John at Patmos* and *Mary Magdalene*.

**Mr. A. Bruce Joy** has completed a bust of Miss Mary Anderson in a medium the composition of which is being patented. The work is at present exhibited at the Free Library and Museum, Liverpool, where Mr. Joy's large marble statue of Mr. Bushell has been unveiled by the Archbishop of York.

**M. Vinçotte** has nearly completed the statue of Aguesseau, which was commissioned by the city of Brussels.

**A "Portrait of an Old Woman,"** by Rembrandt, has been sold in the Hôtel Drouot, Paris, for 25,000 francs. *The Artist's Wife as Pallas*, of which the history was less certain, brought 12,000 francs.

**Mr. James Gowans** has been unanimously recommended by the Council of Guildry to be the successor of the late Mr Hutchison as Dean of Guild for Edinburgh.

**The Annual Meeting** of the Leeds Society of Artists took place on Tuesday, and arrangements for holding an autumn exhibition were considered.

**Additional Vestries**, church parlour, lavatories, &c., are about to be erected in connection with Christ Church, Enfield. Mr. W. D. Church, of 12 South Place, Finsbury, E.C., is the architect.

**Mr. G. Beavell**, architect to the Duke of Northumberland, has delivered a lecture "Home, Sweet Home; or, House Sanitation," in the Town Hall, Alnwick.

**M. Koehlin's** collection of pictures were sold last week in Paris, and realised 74,755 frs. The highest price, 16,200 frs., was obtained for Troyon's *Abreuvoir*. *A Turkish Interior*, by Diaz, brought 15,500 frs.

**Mr. L. Kershaw**, of Brighouse, has commenced the laying-out of the Corporation cemetery at Bowling. The buildings will be erected by Mr. Hepworth.

**Messrs. Rottmann, Strome & Co.** have manufactured and supplied the wall and ceiling decoration used in Messrs. Spiers & Pond's refreshment-rooms at the exhibition of a Japanese village in Humphreys Hall.

**Mr. Charles Longnet Higgins**, of Turvey Abbey, Beds., died lately in his seventy-eighth year. With the aid of Sir Gilbert Scott, he restored the parish church of Turvey at great cost to himself, besides erecting schools and rebuilding a great part of the village. From his exertions he was known as "the lay bishop of the diocese."

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, FEBRUARY 7, 1885.

## THE LITERARY AND ARTISTIC SOCIETY.

ON Monday last there was held at Willis's Rooms one of the monthly conversazioni of this young but most flourishing Society. The programme included a concert, in which Miss Pauline Lowenstark's brilliant playing of a "Rhapsodie Hongroise," by Liszt, and Miss Lena Laws's singing of Pinsuti's "Dream of Peace" call for special commendation. Mr. Sergeant Lee amused the audience by an admirably delivered recitation of the trials of "The Amateur Dramatic Association." During the interval, and while the second half of the concert was being performed, Dr. Carter Moffatt, the now celebrated inventor of the ammoniaphone, gave a short address on the properties of that remarkable instrument, and especially on its efficacy in strengthening and adding flexibility to the vocal powers and greatly improving the tone and *timbre* of the voice. A large number of these flute-like instruments were placed at the disposal of the audience, many of whom availed themselves of the opportunity to personally test this most recent of scientific discoveries. One gentleman, after reciting a part of Hamlet's address to the players, took a few deep inspirations through the ammoniaphone, and redelivered the same lines with a voice distinctly improved both in power and quality. Meantime, in the large room, Mr. W. H. Delf read a criticism of Mr. Chamberlain's recent speech, and the Rev. Dr. McCann gave "A Chat on Thought Reading," followed by some practical experiments which met with only moderate success. Shortly after 10 o'clock the seats were removed from the centre of the room and dancing commenced, and was continued until after midnight, thus bringing an excellent and successful entertainment to an agreeable close.

## SOUTHAMPTON WATERWORKS. Experimental Trials.

THE question of the best means of obtaining a fresh-water supply for the borough of Southampton, which has occupied the attention of the inhabitants of that town for nearly fifty years, seems at last to have been solved. On the chalk hills of Otterbourne, situate eight miles north of Southampton, springs rise to the surface and flow southward until they join the river Itchen. These springs are but the overflow from a great watershed created in the extensive outcrop of the chalk formation which reaches far up into Wiltshire. After careful examination of the district, and with a full knowledge of the geological features, a spot was selected by Mr. W. Whittaker, of Her Majesty's Survey Department, as suitable for obtaining the very large quantity of water required.

Mr. W. Matthews, C.E., the engineer to the Corporation Waterworks, then had the ground between Southampton and Otterbourne surveyed, and prepared the scheme which has just been unanimously sanctioned by the Town

Council, and also approved at a town meeting of ratepayers.

The "Abyssinian" tube-well system is that adopted for the preliminary borings, and Messrs. Le Grand & Sutcliffe, of London, have already completed two of 12 inches diameter and 100 feet deep. Powerful centrifugal engines, worked by portable engines, have been attached to these tube-wells. Working night and day for a week, with the pumps throwing between 400 and 500 gallons per minute, has demonstrated the suitability of the site selected. The total daily supply required is four million gallons, and it is calculated that six additional 12-inch tube-wells will easily provide this quantity of water, without unduly lowering the head of the springs at any one spot.

The quality of the water is pronounced upon analysis to be particularly pure. The permanent hardness is only 2.4. The softening process known as "Atkins's" will be employed, and considerable economy will be secured by manufacturing the lime necessary from the chalk on the spot. The water will flow from the tanks at Otterbourne to the existing reservoirs at Southampton Common. In the Parliamentary powers applied for, other districts have been included in the schedule.

The pumping-station has been visited by the Mayor, with thirty members of the Town Council, and several well-known engineers and geologists who are interested in the very satisfactory results that have been so rapidly obtained, the time occupied over the works having been only about six weeks.

## SANITARY WASHABLE WALL-PAPERS.

MESSRS. HEYWOOD, HIGGINBOTTOM, SMITH & Co., of 61 Watling Street, have just issued a new sample-book, composed entirely of washable papers, arranged in such a manner as to show at a glance the various fillings, dados, and borders *en suite*. It contains numerous and varied designs for halls, staircases, bedrooms, and other purposes, many of which are of great excellence and beauty. These papers, which are warranted *non-arsenical*, are impervious to water, can be readily washed, and possess the incontestable advantage of being remarkably cheap. Among those patterns which struck us as being most worthy of favourable notice were Nos. 3,120—a very pleasing "Japanese" design; 3,052—terra-cotta colour, in "Adams" style, with dado, filling, and border complete; and 37,278—a "willow pattern," which is especially pretty in the lightest colour. The extra cheap washable goods, printed on toned paper, will be found valuable as a preparation for the walls of new houses, which require to be left some time before papering with more expensive papers.

## THE COST OF A NAIL.

AN action has just been tried in Edinburgh in which a mason, named Borthwick, claimed 200*l.* from his employer, Thomas Ormiston, a builder, for damages. While the plaintiff was "pointing" the wall of a house near the station

at North Berwick, the plank on which he was standing gave way, and he fell from a height of 17 feet to the ground. He alleged that the accident occurred through a nail supporting the plank giving way, and that the nail, by the direction of the defender, had been driven into the wall at a spot where there was no sufficient hold for it. The defendant, in answer, stated that he supplied his workmen with proper materials for the scaffold, and that the accident must have arisen from the fault of one of his servants, and, he believed, of the pursuer himself. He accordingly denied liability, and also pleaded contributory negligence. After an absence of an hour and forty minutes, the jury, with consent of parties, gave a verdict by a majority for the plaintiff, assessing the damages at 75*l.*

## AUCTION SUMMARY.

For Week ending Feb. 14.

(See Advertisements.)

WEDNESDAY, 11th:—

Messrs. Fuller, Horsey & Co.—Engineering and Yacht Building Works, Erith.

THURSDAY, 12th:—

Messrs. Farebrother, Ellis, Clark & Co.—Freehold Building Site, Vauxhall.

## COMPETITIONS OPEN.

BEVERLEY.—Plans are required for the Beverley Dispensary and Hospital, for Accommodation for Twelve Patients, with Residence for Medical Officer, &c., cost not to exceed £1,500. Mr. Brigham, Dispensary, Beverley.

BRECON.—Feb. 9.—Plans are required for Altering the Town Hall. Mr. Rhys Davies, Borough Surveyor, Brecon.

CHELSEA.—Feb. 25.—Plans are invited for Additions to Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, King's Road, Chelsea, Clerk to the Vestry.

## CONTRACTS OPEN.

ACLE.—Feb. 11.—For Building House at Methodist Chapel. Mr. Sidney Rivett, Architect, Southtown, Great Yarmouth.

AYR.—Feb. 10.—For Supplying and Fixing Gasholder. Mr. W. Smith, Manager, Gasworks, Ayr.

BATH.—Feb. 23.—For Supply of Glazed Stoneware Sewage Pipes and Gully Traps for twelve months. Mr. Alfred Mitchell, Engineer, Municipal Offices, Market Place, Bath.

BATLEY.—For Building five Terrace Houses, Bath Street. Mr. Walter Hanstock, Architect, Branch Road, Batley.

BEDFORD.—Feb. 24.—For Plans and Specifications and Execution of Works in connection with Sewage Pumping at Outfall Works. Mr. J. Lund, Borough Surveyor, Corn Exchange, Bedford.

BELFAST.—Feb. 14. For Additions to House. Mr. W. H. Lynn, Architect, Calendar Street, Belfast.

BERMONDSEY.—Feb. 24.—For Formation of a Lake in Southwark Park. Mr. J. E. Wakefield, Metropolitan Board of Works Office, Spring Gardens, S.W.

BLACKBURN.—Feb. 9.—For Widening Bridge over George Street, Construction of Retaining Walls, Earthwork, Ballasting, &c. The Engineer, Hunt's Bank, Manchester.

BLACKBURN.—Feb. 9.—For Construction of Station. The Engineer, Hunt's Bank, Manchester.

BLACKPOOL.—Feb. 7.—For Building Engine and Boiler-houses, Offices, and Carriage-shed for the Electric Tramway Company. Messrs. Horsfall & Williams, Architects, Post-office Buildings, Halifax.

BLAENYWAUN.—Feb. 28.—For Building Baptist Chapel. Mr. John Llewelyn, Brynllwelyn, St. Dogmell's, Cardigan.

BOLTON.—Feb. 9.—For Building Goods Warehouse. The Engineer, Hunt's Bank, Manchester.

BRADFORD.—Feb. 9.—For Building Sunday Schools at St. Mark's Church, Manningham. Messrs. Morley & Woodhouse, Architects, 15 Darley Street, Bradford.

BUILTH.—Feb. 7.—For Supplying Socket and Splay Junction Pipes. Mr. Evan Owen, Clerk to the Local Board, Builth.

BUNDORAN.—Feb. 25.—For Excavation of Channel in Rock (400 feet long), Construction of Boat Slip and Platform, Landing Quay (165 feet long), and Inclined Approach. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

CANTERBURY.—Feb. 11.—For Building Engine and Boiler-houses, Chimney Shaft, and other Works, Barton Mills. Mr. John G. Hall, Architect, 4 St. Margaret's Street, Canterbury.

CARDIFF.—Feb. 16.—For Building Printing Works and Offices, Westgate Street, for Messrs. D. Duncan & Sons. Messrs. James, Seward & Thomas, Architects, Cardiff.

CARDIFF.—Feb. 9.—For Building Workshops, Offices, &c., and for Construction of Gridiron and Berth for Offshore Floating Dock and Sea Wall. Mr. H. W. Butler, C.E., 35 West Bute Street, Cardiff.

CARDIFF.—Feb. 17.—For Construction of Wrought-iron Retort House and Coal Store. Roofs, Hydraulic and Foul Mains, Retort Fittings, Ascension Pipes, and Lime Shed Roof, also Annular Condensers with Syphons and Connections. Mr. H. Morley, Engineer, Gas Office, Cardiff.

CASTLE BROMWICH.—Feb. 16.—For Widening and Remaking Stetchford Lane (760 yards). Mr. W. S. Till, Borough Surveyor, Council House, Birmingham.

CHADDERTON.—For Building Six Cottages. Plans, &c., at 87 Denton Lane, Chadderton.

CHESHAM.—For Building Congregational Chapel and School. Messrs. W. G. Habershon & Fawckner, Architects, 28 Bloomsbury Square, W.C.

CHORLTON-CUM-HARDY.—Feb. 7.—For Construction of Pipe Sewer (1,700 yards). Mr. Joseph Swarbrick, Surveyor, Town Hall, Withington, Manchester.

COLCHESTER.—Feb. 11.—For Building Three Cottages, Crowhurst Road. Mr. J. F. Goodey, Architect, 2 Victoria Chambers, West Stockwell Street, Colchester.

COLE VALLEY.—Feb. 7.—For Construction of Third Section of the Cole Valley Sewers (2,000 yards run of 4 feet by 2 feet 8-inch Brick Sewer), with Manholes, Lampholes, Railway Crossings, &c. Mr. W. S. Till, Borough Surveyor, Council House, Birmingham.

CREWE.—For Construction of Bicycle Race Track, Erection of a permanent Wood Fence, and Enlarging the Pavilion. Mr. Furber, Architect, Hightown, Crewe.

CROYDON.—Feb. 9.—For Making Roads and Paths, Asphalted Yards, &c., at New Infirmary. Plan and Specification, by Messrs. Berney and Monday, Architects, at the Infirmary, Mayday Road, Croydon.

DARLINGTON.—Feb. 18.—For the Works in Building Central Passenger Station, including Platforms, Roofing, &c. Mr. William Bell, Architect to the North-Eastern Railway Company, York.

DUBLIN.—Feb. 11.—For Works of Sewerage and Water Supply on Hill and Town of Howth. Mr. Richard A. Gray, C.E., Fortfield House, Upper Rathmines.

DULWICH.—Feb. 26.—For Building Infirmary for the Guardians of St. Saviour's Union. Messrs. Jarvis & Son, Architects, 29 Trinity Square, E.C.

DUNDALK.—Feb. 14.—For Supplying the Clogher Valley Tramway Company (Limited) with 3,000 tons of 45-lb. Steel Rails (ordinary flat-foot railway form), with Fishes and Washers, and 90,000 Baltic Sleepers, 6 feet by 8 inches, creosoted. Messrs. Barton, Company's Engineers, Exchange Buildings, Dundalk.

EDINBURGH.—Feb. 11.—For Additions to Coltbridge Public School. Mr. R. Wilson, Architect, 2 Queen Street, Edinburgh.

EDINBURGH.—Feb. 18.—For Completion of Industrial Museum. Mr. A. B. Mitford, Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

ELGIN.—For Erection of Academy Buildings, Gates, and Railings, Messrs. A. & W. Reid, Architects, Elgin.

ELGIN.—Feb. 7.—For Additions to various Farm Buildings. Messrs. M'Bey & Gordon, Surveyors, Elgin.

ELTON.—Feb. 21.—For Building Stone Base, Pillars, Entrance Gates, &c., for proposed Recreation Ground. Mr. J. Cartwright, C.E., Borough Surveyor, Bury.

ELY, CARDIFF.—For Additions to Paper Works. Mr. S. Rooney, Architect, 16 Crockherbtown, Cardiff.

FARNWORTH.—Feb. 19.—For Construction of Bridge. Mr. W. Radford, 1 Princess Street, Manchester.

FENTON.—Feb. 18.—For Supplying and Erecting Sulphate of Ammonia Plant to Gasworks. Messrs. G. W. Stevenson & Son, C.E., 38 Parliament Street, Westminster, S.W.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.]  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

**HENRY CONOLLY,**

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

**THE "SAFETY" VALVE WATER-CLOSET,**  
WITH  
**Conolly's Reversible Trap (Patent No. 3,754).**

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

**53 & 55 Hampstead Road, 169 & 171 Drummond Street.**  
**WAREHOUSES—TOLMERS SQUARE, N.W.**

**FERRYHILL.**—Feb. 7.—For Building Superintendent's House, Porch, Boundary Walls, &c., and for Draining and Laying out Cemetery. Mr. Robert W. Thompson, Architect, Bishop.

**FORDINGBRIDGE.**—Feb. 10.—For Building Workhouse for 117 Inmates. Mr. Fred Bath, Architect, Crown Chambers, Salisbury.

**FORGNEY.**—Feb. 10.—For Alterations to School-house for Conversion into Glebe House. Mr. C. A. Owen, Architect, Molesworth Street, Dublin.

**GENERAL POST OFFICE.**—Feb. 12.—For Laying and Working Telegraph Cable to the West Coast of Africa from St. Vincent, Cape Verde Islands. The Secretary, General Post Office, E.C.

**HEMPSTED.**—Feb. 19.—For Works connected with St. Swithin's Church. Messrs. Waller, Son & Wood, Architects, 17 College Green, Gloucester.

**HEREFORD.**—For the Erection of a Cask Shed, 127 feet long by 40 feet, of Corrugated Iron, Wrought-iron Principals and Cast-iron Columns. Mr. W. W. Robinson, Architect, 21 King Street, Hereford.

**HOLBORN.**—For Taking Down and Rebuilding Nos. 13, 15, and 17 Gray's Inn Road. Mr. R. W. Crawley, Architect, 12 Trinity Square, Tower Hill.

**HOVE.**—Feb. 13.—For Construction of Storm-water Outfall and other Works. Mr. Ellice Clark, C.E., Town Surveyor, Hove, Brighton.

**HOWDEN.**—Feb. 20.—For Construction of Glazed Socket Earthenware Tube Sewers, part in Concrete, Cast-iron Piping and Gulleys, Brick Shafts, Ventilators, Flushing-doors, &c. Mr. A. M. Fowler, C.E., 1 St. Peter's Square, Manchester.

**HUDDERSFIELD.**—Feb. 11.—For Construction of Brick Sewer with Manholes, Lampholes, &c. Mr. R. S. Dugdale, Borough Surveyor, Town Hall, Huddersfield.

**IRVINE.**—Feb. 12.—For Construction of Timber Wharf at Harbour Quay. Messrs. Leslie & Reid, 72A George Street, Edinburgh.

**KING'S LYNN.**—Feb. 7.—For Construction of a Three-span Wrought-iron Lattice Girder Highway Bridge over the River Nar. Mr. E. G. Mawbey, Borough Engineer, King's Lynn.

**KINSALE HARBOUR.**—Feb. 17.—For Construction of a Pier at the Town Rock; Quay and Embankment from Cramer Street to Pier (1,740 feet); Embanked Approach Road from Main Street; and Construction of Boat Slips, Flights of Steps, Culverts, Fences, &c. The Superintendent, Harbour Works, Kinsale. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

**KIRKBY OVERBLOW.**—For Heating (Hot-Water) Parish Church. Mr. Robert Burton, Pannal, near Harrogate.

**KIRKCALDY.**—Feb. 10.—For Supplying 1,780 tons of Dry Sand Cast-iron Pipes from 12 inches to 8 inches diameter. Mr. John Sang, C.E., Kirkcaldy, or Messrs. Leslie & Reid, C.E., 72A George Street, Edinburgh.

**LEEDS.**—For Building Detached House at Roundhay. Mr. John Hall, Architect, 59 Albion Street, Leeds.

**LERWICK.**—Feb. 21.—For Building United Presbyterian Church. Mr. Alexander Mitchell, Union Bank, Lerwick.

**LICHFIELD.**—Feb. 12.—For Extension of the Union Workhouse. Mr. W. H. Crompton, Architect, Horton Lodge, Lichfield.

**LISCANNOR.**—Feb. 25.—For Extension of the North Groin (60 feet), Deepening Harbour by Rock Excavation, Removal of Portion of Black Rock, Construction of Two Beacons, Boat Slip, and other works. Plan and Specification at the Office of Public Works, Dublin.

**LONG EATON.**—Feb. 16.—For Building School-room, Class-room, Out-offices, &c. Mr. John Sheldon, Architect, Market Place, Long Eaton.

**LONGFORD.**—Feb. 10.—For Erection of Farm Buildings, &c. Mr. C. A. Owen, Architect, 16 Molesworth Street, Dublin.

**LONGTON.**—Feb. 17.—For Constructing Telescopic Gasholder. Mr. J. M. Darwin, Engineer, Gasworks, Longton.

**MERTHYR TYDVIL.**—Feb. 13.—For Building Ward at the Workhouse. Mr. Thomas Roderick, Architect, 40 Monk Street, Aberdare.

**MILTON.**—Feb. 10.—For Repewing and Renovating Interior Walls of Parish Church. Rev. T. B. Robinson, Milton Rectory, Lymington.

**NEWARK.**—Feb. 12.—For Building Christ Church Parochial Rooms. Mr. Geo. Sheppard, Architect, 9 Kirkgate, Newark.

**NEW BRIGHTON.**—Feb. 12.—For Building Turnstile House and Boxes at the Landing Stage. Mr. A. Lowson, C.E., Great Queen Street, Westminster, S.W.

**NEWCASTLE-ON-TYNE.**—For Building Schools. Mr. Edward Shewbrooks, Architect, 2 Market Street, Newcastle-on-Tyne.

**NEWCASTLE-ON-TYNE.**—Feb. 7.—For Building Extensive Range of Shops and Show-rooms, Pink Lane. Mr. Wm. Glover, Architect, 16 Market Street, Newcastle-on-Tyne.

**NEW HEX, ROCJIDALE.**—Feb. 7.—For Building Shed for Spinning Company. Mr. Robert Evans, Architect, Royton.

**NORTHAMPTON.**—Feb. 12.—For Building Wesleyan Hall and School-rooms. Mr. H. H. Dyer, Architect, 42 St. Michael's Road, Northampton.

**NORTH-EASTERN RAILWAY.**—Feb. 18.—For Construction of Works in connection with Widening Main Line from Manors Station to Heaton Junction (1 mile 40 chains). Plans and Specification to be seen by Feb. 2 next, at the Engineer-in-Chief's Office, Newcastle-on-Tyne.

**NORTH-EASTERN RAILWAY.**—Feb. 18.—For Building Passenger Station. Mr. Wm. Bell, Company's Architect, York.

**NOTTINGHAM.**—March 4.—For Building Law Courts and Offices on Site of Old Cattle Market. Messrs. Verity & Hunt, Architects, 27 Regent Street, S.W.

**NUNEATON.**—Feb. 10.—For Building Shed for Steam Road Roller. Mr. C. Green, Surveyor, Nuneaton.

## SALES BY AUCTION.

**FOY, MORGAN & CO.** beg to announce that their Next PUBLIC AUCTION will take place on **WEDNESDAY, FEBRUARY 18, 1885,** at the **BALTIMORE SALE-ROOM,** Threadneedle Street, E.C., when they will offer their usual assortment of **DEALS, BATTENS, BOARDS, TIMBER,** &c. Catalogues will be issued in due time.

**FOY, MORGAN & CO.** {Wood Brokers, 108 Bishopsgate Street Within, E.C.

Sales for the Year 1885.

**MESSRS. BAKER & SONS** beg to announce that their SALES of LANDED ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Land, Ground-rents, Reversions, and other Properties, will be held at the Mart, Tokenhouse Yard, E.C., as follows:—

Friday, February 27  
Friday, March 6  
Friday, March 20  
Friday, March 27  
Friday, April 10  
Friday, April 17  
Friday, April 24  
Friday, May 1  
Friday, May 15  
Friday, May 22  
Friday, May 29  
Friday, June 12  
Friday, June 19  
Friday, June 26  
Friday, July 3

Friday, July 10  
Friday, July 17  
Friday, July 24  
Friday, August 14  
Friday, August 28  
Friday, September 11  
Friday, September 25  
Friday, October 2  
Friday, October 9  
Friday, October 30  
Friday, November 13  
Friday, November 20  
Friday, November 27  
Friday, December 4  
Friday, December 11

Auctions can be held on other days besides those above specified.—No. 11 Queen Victoria Street, E.C.

**CROWTHORNE, BERKS, and BLACKWATER, HANTS.**

**H. J. E. BRAKE** will SELL by AUCTION, at the Royal Swan Hotel, Blackwater, Hants, on Monday, February 9, 1885, at Four for Five o'clock in the afternoon, about 80 acres of valuable FREEHOLD LAND at Crowthorne, Berks (a portion of which is covered with thriving Fir Plantation), in plots from a quarter of an acre to 12 acres each, and a few choice plots with frontages to the main road suitable for shops; also three valuable Building Plots adjoining the Royal Swan Hotel, Blackwater. May be paid for by instalments.

Plans, particulars, and conditions of the Auctioneers, Farnborough, Hants.

Auction Sales for 1885.

**MESSRS. GLASIER & SONS** beg to announce the following dates upon which they will hold SALES by AUCTION of LANDED ESTATES, Residences, Business Premises, Reversionary Interests, and Freehold and Leasehold Property generally, at the Mart, Tokenhouse Yard:—

Thursday, February 19  
Thursday, March 26  
Thursday, April 16  
Thursday, May 14  
Thursday, June 11  
Thursday, July 2

Thursday, July 23  
Thursday, August 6  
Thursday, October 2  
Thursday, November 26  
Thursday, December 10

They will be glad to receive early intimation of property intended to be included in any of the above sales. Additional sale days can be arranged to meet the convenience of clients.—41 Charing Cross.

### VAUXHALL.

On the Albert Embankment, in close proximity to the river. A Freehold Building Site of about 12,500 square feet, with extensive frontages to the road and pathway of the Embankment, close to Messrs. Doulton's Potteries and other large factories, eminently suitable for the erection of a warehouse, Public Hall, or business premises requiring space and a prominent and commanding position unequalled in the district.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** are instructed to offer for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Thursday, February 12, 1885, at 2 o'clock, the above valuable FREEHOLD BUILDING SITE.

For particulars apply to H. E. Brown, Esq., Solicitor, 22 Great George Street, Westminster, S.W.; or to Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, and 18 Old Broad Street, E.C.

To Land Companies, Building Societies, Speculators, and others.—Lavender Hill and Wandsworth Common, S.W.—A highly important Freehold Building Estate (land tax redeemed), comprising nearly nine acres, occupying a most commanding position, extending from St. John's Road to Wandsworth Common, to which it has together over 1,000 feet of frontage. The property is situate only a short distance from Battersea Park and Clapham Common, adjoining St. Mark's Church, within two minutes' walk of Clapham Junction Station, giving exceptional facilities of access to the City and all parts of town, while good service of trams runs close to the estate at frequent intervals. The land, which slopes gently towards St. John's Road, is almost the only property in the neighbourhood yet uncovered, and is in the midst of a locality where houses of a moderate class are in constant demand. It is ripe for immediate building operations, and possesses unusual advantages for development, its position being such as to enable the whole estate to be most profitably dealt with. Possession on completion of purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** have received instructions to offer the above valuable FREEHOLD ESTATE for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two o'clock precisely, in one Lot.

Particulars, plans, and conditions of sale may be obtained of Messrs. Maples, Teesdale & Co., Solicitors, 6 Frederick's Place, Old Jewry, E.C.; of Sharon Grote Turner, Esq., Solicitor, 56 Lincoln's Inn Fields, W.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

The adjoining Freehold Property, as set out in the following announcement will be sold at the same time and place.

St. John's Hill, Wandsworth Road.—A valuable Freehold Property, ripe for building development, with an extensive frontage to St. John's Hill. This important site covers rather more than an acre, and is admirably circumstanced. There is at present on the land a detached cottage residence, with stable and outbuildings, and possession will be given on completion of the purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** will SELL this valuable ESTATE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two o'clock precisely, in one Lot. Particulars, plans, and conditions of sale may be obtained of Messrs. Maples, Teesdale & Co., Solicitors, No. 6 Frederick's Place, Old Jewry, E.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

**FULHAM, S.W.**—A valuable Freehold Building Estate, comprising altogether over 13 acres, with three detached residences thereon, occupying a commanding position on in one of the main thoroughfares in this rising neighbourhood. It is situated only a short distance from Hammersmith Broadway and the new St. Paul's Schools, close to the proposed Hammersmith and Fulham recreation grounds, and almost adjoining the extensive cricket-ground in course of construction on the Baron's Court Estate, while it possesses unusual facilities of access, being within a few minutes' walk of five railway stations, and close to good omnibus routes. The land, which contains excellent gravel, and sand, possesses an extensive frontage to the Little Road, is ripe for immediate building operations, and forms one of the most important estates recently brought into the market in this locality. There are also two detached plots in Margravine Road, eminently suited for the erection of cottage property. Possession of the greater portion on completion of the purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** have received instructions to offer the above important Estate for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two, in Two Lots. Particulars, plans, and conditions of sale may be obtained of Messrs. Few & Co., Solicitors, 19 Surrey Street, Strand, W.C.; of Messrs. Simpson & Collingford, Solicitors, 26 Gracechurch Street, E.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

Re Edward Grove, Esq., deceased.—Surrey.—Extensive and valuable Freehold Building Estates, in the parishes of Frimley, Chertsey, Kingston, Long Ditton, and Addlestone; and Meadow Land at Medmenham, Bucks.

**MESSRS. FAREBROTHER, ELLIS, CLARK & CO.** will offer for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., in May next, about 160 Acres of valuable LEATHLAND, situate at Frimley, Surrey, well adapted for building operations; 30 Acres of Building Land at Chertsey; 20 Acres at Addlestone, within one mile of the station; Tolworth Farm, Long Ditton and Kingston, comprising about 40 Acres, lying in an elevated position; and a productive parcel of Meadow Land at Medmenham, Bucks, containing 1a. 3r. 0p.—Particulars may be obtained as in preceding advertisement.

Lewisham. Second Portion of the Priory Estate.—Pleasantly situated, with important frontages to Lewisham High Road and the new roads leading therefrom; close to Ladywell Station, and within a short omnibus ride of Lewisham Junction Station, whence frequent trains run to the City and West End.—Freehold Building Land and fine old Mansion, which could be easily subdivided into two or three residences; also a very valuable tavern plot and a splendid walled-in kitchen and fruit garden, well stocked, and containing vineyard and forcing pits, &c. Easy payments. Free conveyances. Subsoil sand and gravel.

**MR. RICHARD J. COLLIER** having sold the whole of the first portion, will SELL by AUCTION, at the Plough Tavern, High Street, Lewisham, on Monday, February 23, at Six for Seven o'clock in the Evening, a further portion of this valuable estate, comprising about 50 lots of eligible FREEHOLD BUILDING LAND, free of title and land tax, including several capital shop plots and a magnificent site for a tavern; also the fine old mansion known as The Priory, and a well-stocked kitchen and fruit garden, with vinery, &c.—Plans and particulars may be obtained of C. A. Buss, Esq., Solicitor, 62 King William Street, E.C.; of H. Davis, Esq., 2 Arthur Street, East, London Bridge; at the place of sale; of the foreman on the estate; and of the Auctioneer, 28 Finsbury Pavement.

[For remainder of Auctions, see page xi.]

**OLDHAM.**—For Alterations and Additions to Vale Mills. Mr. Joseph Stott, Architect, 26 Clegg Street, Oldham.

**PENYCLAWDD.**—Feb. 12. For Restoring St. Martin's Church. Rev. J. P. David, Penyclawdd Rectory, near Monmouth.

**PORTO RICO.**—March 22.—For Supply of Dredging Apparatus. The Spanish Consulate-General, 21 Billiter Street, E.C.

**SHEFFIELD.**—Feb. 11.—For Construction of Main Sewers (3½ miles), part of Main Sewerage Scheme. Mr. Charles Gott, C.E., 108 Norfolk Street, Sheffield.

**SOUTHAMPTON.**—Feb. 12.—For Construction, in Brick, Cement, and Concrete, of Settling Pond and Lime Tank, at Pumping Works at Michelmarsh. Mr. J. J. Burnett, Secretary, South Hants Water Company, Guildhall Chambers, High Street, Southampton.

**SOUTH INDIAN RAILWAY.**—Feb. 10.—For Supply of 500 tons of Bridge Work, comprising Seven 150 feet Spans, and Eleven 40 feet Spans. Mr. Henry W. Notman, Managing Director, Company's Office, 55 Gracechurch Street, E.C.

**STONE.**—June 17.—For Improvement Works, Victor Street West. Mr. H. Fishwick, Clerk to the Local Board, Stone.

**SUNDERLAND.**—March 21.—For an Underground Hauling Engine. Mr. C. R. Barrett, Seaham Colliery, Sunderland. And for Winding Engine. Mr. F. S. Panton, Silksworth Colliery, Sunderland.

**TIGHNABRUACH.**—Feb. 7.—For Concrete Wall, Embankment, &c., for Reservoir. Mr. J. R. Thomson, C.E., Rothesay.

**TRIM.**—Feb. 7.—For Supplying and Fixing Iron Footbridge from Nurses' Residence to Hospital of Union Workhouse. Mr. John P. Davis, C.E., Trim.

**VENTNOR.**—Feb. 23.—For Construction of Promenade Pier and Landing Stage. Mr. H. E. Wallis, C.E., Palace Chambers, Bridge Street, Westminster.

**WALSALL.**—Feb. 14.—For Construction of Street and Outfall Sewers, together with three

Cast-iron Pipe Syphons under Canals, with Man-holes, Lamp-holes, Ventilators, &c. Mr. Arden Hardwicke, Borough Surveyor, Walsall.

**WEST CORNWALL RAILWAY.**—Feb. 24.—For Erection of Masonry of Penwithers Viaduct, near Truro. Plans at the Engineer's Office, Paddington and Plymouth.

**WESTMINSTER.**—Feb. 9.—For Supplying and Fixing Boiler at Baths and Wash-houses, 34 Great Smith Street. Mr. Warrington Rogers, Clerk to the Commissioners, 9 Victoria Chambers, Victoria Street, Westminster.

**WHITECHAPEL.**—Feb. 9.—For Works of Building at Goulston Square Baths, and for Construction of Two Swimming Baths. Mr. John Hudson, Architect, 8 Leman Street, Whitechapel.

**WINCHESTER.**—For Building Dwelling-house at St. Cross. Messrs. John Colson & Son, Architects, 45 Jewry Street, Winchester.

**WREXHAM.**—Feb. 11.—For Construction of Sewers. The Borough Surveyor, Guildhall, Wrexham.

**YORK.**—Feb. 16.—For Building Probate Registry. Mr. A. B. Mitford, Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

LAW, Kidderminster (accepted) . . . £13,991 0 0

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"Sir,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy." "JAMES WEIR, F.R.I.B.A.

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy,"  
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy,"  
From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

## TO ARCHITECTS, BUILDERS AND CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## PATENT WROUGHT STEEL NAILS. OVAL WIRE NAILS.

LETTERS PATENT.

ESTABLISHED A.D. 1774.

## AUSTIN'S

NEW IMPERIAL PATENT

## SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unequalled satisfaction to the trade for now over One Hundred Years; and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in town and country.

N.B.—Please note that all our goods as advertised above are labelled, either inside or outside, with our Trade Mark—The Anchor.

**BELLMAN'S PATENT GULLY.**

This Gully possesses the following advantages:—

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

**ART PLATES FROM "THE ARCHITECT."**

Proof Impressions of the following Illustration which has appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

**The Bard.**

**FACSIMILE OF CARTOON BY PROFESSOR MAILLART.**

Size, Thirty-six Inches by Twenty-two Inches.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

May be obtained from all Newsagents or Booksellers, or from the

**Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.**

INTERNATIONAL SMOKE ABATEMENT  
EXHIBITION, SOUTH KENSINGTON,

NOV. 1881 to FEB. 1882.

Houses, Infirmaries, Hospitals, Schools, or  
any kind of Building

# THOROUGHLY WARMED AND VENTILATED BY THE PATENT WARM-AIR GENERATING MANCHESTER GRATES OR STOVES

*By their use in ground-floor rooms of houses fires in bedrooms are not required.*

ROOMS RENDERED HEALTHY, COMFORTABLE, AND OF AN EQUABLE TEMPERATURE THROUGHOUT.

Thousands in use in Great Britain, Ireland, and the Continent.

MADE IN EVERY SIZE AND DESIGN.

## SHORLAND'S PATENT MANCHESTER WARM-AIR BACKS

Are made in every size, and are applicable to every description of Grate Front. No Grate complete without them. They convert the ordinary Open Fire Grate from being the most extravagant into the most economical method of warming. Rooms containing 50,000 cubic feet of space warmed by one Open Fireplace, a feat hitherto considered impossible. Hundreds of testimonials, alphabetically arranged, free on application.

## THE PATENT COMBINATION OPEN FIREPLACE MANCHESTER STOVE,

WITH ASCENDING OR DESCENDING SMOKE-FLUE.

Most suitable for rooms having no Fireplaces, such as churches, chapels, schools, halls, billiard-rooms, railway station waiting-rooms, asylums, hospitals, infirmaries. Fills the rooms with pure fresh air in the summer and warmed air in the winter. As in use at the Royal Observatory; Royal Naval College, Greenwich; Royal Naval Hospital, Greenwich; Royal Military Barracks, Eastney, Portsmouth; the Bank of England, and its branches at Manchester, Liverpool, Plymouth, Newcastle-on-Tyne, and Birmingham; and hospitals, banks, asylums, churches, &c., throughout the kingdom.

## VENTILATION BY MEANS OF VERTICAL TUBES,

Which are made in every size and design, for supplying rooms of every description with Pure Air  
WITHOUT DRAUGHT.

These Vertical Tubes and Bends (which can be easily fixed by an ordinary workman) admit volumes of fresh air from the outside into rooms without draught. The air being delivered in a fountainlike form ascends to the ceiling, where it mingles with the air of the room, gradually falls, and eventually is carried away through the Extractors, Ventilator, or Fireplace.

THOUSANDS IN USE in buildings of every description from the cottage to the palace.

"All difficulties in connection with Ventilation solved by the use of Vertical Tubes" (Vide the TIMES), of which  
SHORLAND IS THE ORIGINATOR, PATENTEE, and MANUFACTURER.

NEW ILLUSTRATED PRICE LIST, WITH TESTIMONIALS, &c., FREE ON APPLICATION.

In use in palaces, gaols, churches, billiard-rooms, banks, workhouses, mansions, cottages, schools, police cells, Royal Observatory, asylums, H.M.'s Government offices, &c., &c.

### LEGAL NOTICE.

SHORLAND'S PATENT GRATE BACK, No. 3,999, A.D. 1874; known as the "MANCHESTER GRATE."—In the action of Shillito and Others v. Larmuth & Co., 1884, S No. 4,408, on November 24, 1884, a PERPETUAL INJUNCTION was ordered, restraining the Defendants from Infringing SHORLAND'S PATENT, and ordering them to pay the Plaintiffs' costs of the action.

**E. H. SHORLAND,** WARMING, SANITARY, & VENTILATING ENGINEER  
(LATE SHILLITO & SHORLAND),  
CONTRACTOR TO HER MAJESTY'S GOVERNMENT,  
**St. Gabriel's Works, Erskine Street, Manchester.**

# The Architect.

## THE WEEK.

AN addition has been made to the teaching power available for archæology and art in Oxford. The new Lincoln professorship has been filled, and Mr. W. M. RAMSAY has been selected for the appointment. The Professor has for his province the arts, monuments, coins, and inscriptions of classical antiquity, and Asiatic and Egyptian antiquities, and will have charge of the University collections of objects connected with his subject, as the Arundel and Pomfret marbles. Mr. RAMSAY has done good work in the Levant during the time that he held the endowment provided by the late Professor MONTAGUE BERNARD for the encouragement of research in Greece.

It has been often remarked that the sketches for M. BAUDRY'S paintings in the Paris Opera House are more satisfactory than the finished works. M. VERON endeavours to account for the difference by saying that in each of the sketches we have not one but several gestures simultaneously suggested, while in the painting one only can be seen. But much of the disappointment hitherto felt must be attributed to the lighting of the Opera House, which was productive of a rather sombre effect. The electric light has now been introduced in combination with gas, and, owing to the clearer illumination, M. BAUDRY'S paintings have assumed quite a new aspect. Groups which before appeared to be an indistinct mass, like the wrong side of a piece of tapestry, and of which the meaning had to be derived from engravings, now resolve themselves into most graceful figures, with a significance which all *habitués* can recognise. Visitors to the Opera will henceforth be able to say that the praise given to the paintings by artists has been fully deserved.

THE annual meeting of the Sanitary Assurance Association was held on Monday. It was stated that the work of sanitary inspection and issue of sanitary certificates had been continued on the plan initiated by the Association in 1881. The properties inspected during the year had been of the most varied character, including residences of every class in London and the country. In every case save one the sanitary arrangements had been found to be more or less defective. During the past year the Council had so altered its work in details as to materially reduce the cost of the inspections, the supervision of work, and the sanitary certificates both for London and the country. A reduced and inclusive scale of fees had been issued, with the result that the demand for the services of the Association had so much increased that, in spite of the reduced charges, the financial statement for the year showed a greater income than in 1883.

It was announced on Thursday that the Earl of ROSEBERY had been appointed First Commissioner of Works in succession to Mr. SHAW-LEFEVRE, who is now Postmaster-General. The Minister of Works may hope to have the gratification of concluding the arrangements for the new Government Offices. It is expected that the altered plans will be ready soon after Parliament meets. Lord ROSEBERY possesses great ability, and it will be all required if the duties of the office are conducted in the able manner of the late Minister. His lordship might, however, with advantage to the State, more often seek the co-operation of unofficial architects in Government works.

THE design of the colossal Forth Bridge which is now in course of construction does not give satisfaction to all mathematicians. A paper was read by Dr. SANG in Edinburgh on Monday night in which the author said that in regard to the structure of the truss, he was at variance with the designer of the bridge. The crossed bracings introduced new points, each of which must have its three determinants; but as the bracings were in pairs, and as no collection of even numbers could ever make an odd number, there must

always be either deficiency or redundancy. Solely from a geometer's point of view, the construction was inadmissible. This opinion was supported by other speakers. But it should be remembered that the Tay Bridge, which was destroyed by a storm that was not very severe, was essentially a mathematician's bridge. The Forth Bridge having been designed by Mr. BAKER, who is a practical engineer as well as a mathematician, has a better chance of enduring.

ONE of the ugliest churches in Great Britain is the Barony Church, in Glasgow. The only point of interest about it is that the expense of repairing it has corresponded with the ugliness. It is at length to be removed, and a more seemly building erected. A letter has been published which throws a light on the peculiarity of the design. JAMES ADAM was one day informed at a dinner-table that a church was about to be built. He immediately asked for the commission, saying that he had never been able to design a building in Scotland, while his brother ROBERT was fortunate in that way. He offered to prepare a design without charge. After considering the subject, JAMES ADAM professed to be in a difficulty, for if, as he said, he made a fine Gothic building, it might hurt the cathedral; and if he made one in a more modern style, it might hurt his brother's infirmary. Everything was, therefore, made as plain as possible. The modesty of the man in putting restraint on his genius for the sake of Glasgow Cathedral is amusing, and his belief that his Barony Church would, when complete, form a picturesque group with cathedral and infirmary has not been realised. The history of the building should be a warning to clergy and churchwardens against the adoption of gratuitous plans.

THE wall of London town has always been a puzzle to archæologists. On Monday a paper, by the veteran Mr. C. ROACH SMITH, was read at a meeting of the London and Middlesex Archæological Society, in which it was maintained that the wall was coeval with the enclosing of London by the Romans, that this was the original wall, and that what are called the "bastions" were built up against it when it was erected. On the other side, it was contended that the bastions were built at a period subsequent to the erection of the wall, out of the materials of older buildings, for the purpose of strengthening it. But is it not rather unusual for a Roman fortification to need strengthening?

THE Blue Book on Technical Instruction, which has just been published, is of much value. It is suggested in one report that in Ireland it would be an advantage to have in the chief city of each province art schools or academies on a large scale, with a permanent collection of pictures and objects of art. The principal should be an artist with an adequate salary. Travelling studentships should be connected with the school. There are many parts of England and Scotland where an academy of the kind is no less needed.

THE paper which has been read before the Society of Arts by Mr. C. G. LELAND, the American writer on education in industrial art, suggests that it is not impossible to have work done by youths and children in England, which will compete with the Swiss and German work. In America Mr. LELAND'S classes have been very fortunate. He relates that one pupil—a schoolboy of seventeen—made over 40*l.* by *repoussé* brasswork during two months of a holiday, and Mr. LELAND lately paid a boy of fourteen more than 3*l.* for work which he had executed after school in ten days. In the wood-carving class the wages were about 2*l.* a week. While every one must wish to see children give aid to their families, it must not be overlooked that work of this class is not perfect, and that the value of really good work is affected by it. We have known cases where a mere nominal price was given for excellent Swiss carving, which was the work of an artist no longer young, on the ground that purchasers could not help believing that it was made by the united labour of several children. In this country art industries have many obstacles in their way, and the number is likely to be increased by philanthropic experiments.

## AN EXPERIMENT IN ART EDUCATION.

THE village of Bushey, in Hertfordshire, has a claim on the interest of artists. It was there that Dr. MUNRO, a physician of the Adelphi, owned a country-house, to which promising young artists were invited, in order that they might have opportunities to sketch in the neighbourhood. THOMAS GIRTIN, TURNER, and WILLIAM HUNT were among them; and HUNT, who stopped for a month at a time, received from the doctor 7s. 6d. a day for his drawings. Bushey bids fair to have still more artistic interest, for at the end of the straggling village Mr. HUBERT HERKOMER, A.R.A., has set up an art school, which, considering all things, is the most remarkable in England.

It would, perhaps, be more correct to say that the school has been established for Mr. HERKOMER. We trust we are not offending the gentleman who has so generously imitated the example of Dr. MUNRO by divulging his name, but it is only fair to say that the entire expense of the buildings and maintenance has been borne by Mr. THOMAS ECCLESTON GIBB, whose name is known as the principal official in the large parish of St. Pancras, and as one of the first authorities in England on all questions relating to local government. It is not to be supposed that the school is a speculation of Mr. GIBB'S. We are so prone in England to imagine that every good deed must have been inspired by a hope of reward in coin of the realm, that it is not always easy to convince people that other men besides Mr. RUSKIN can be disinterested when they try to promote a love and knowledge of art in this country. It cannot, however, be too widely known that Mr. HERKOMER has not the slightest intention of receiving any share of the fees which may be paid by the students, and Mr. GIBB will be perfectly satisfied if the fees balance the outlay. When it is stated that the cost of nine months' tuition is eighteen pounds, and that the school is never likely to have more than fifty students, the sum to be divided, after all expenses are paid, need not excite the interest of the local surveyor of income-tax. The artist is rewarded by having an opportunity to become a teacher; while his friend finds more gratification from believing that an interesting experiment is being carried out with his aid than could be derived from an investment in stocks or shares. That the project should be undertaken by a vestry clerk and one of the busiest of painters, goes far to prove that the age in which we live is not so selfish as has been alleged.

Mr. GIBB and Mr. HERKOMER are next door neighbours, and the schools have been built on Mr. GIBB'S plot of ground. They are approached through a cloister which has been erected from Mr. HERKOMER'S design, and affords a pleasant walking place for the students. The rooms are large and lofty, and each of them is lighted in a different manner. The illumination of one at least of them might be described by the laureate's "fierce light which beats upon a throne and blackens every blot." A student who honestly paints the model as it is seen there will find that his work differs from the life studies in most schools. The light is one of the factors in the system of education. The end that is sought is apparently that the student should use his eyes rather than his memory, and paint what he sees before him, regardless whether the lights and shades correspond with his recollections of pictures or studies which have been produced under different circumstances. In order that the students may not become too familiar with one effect of light, they change from time to time into the other rooms. It is not every one who knows how to see, and the training of the student for the attainment of artistic vision cannot begin too soon. The mind as well as the eyes must be exercised, for what are all the mysteries of light and shade which give life to drawing and painting but simple deductions, which have to be produced by a sort of logical process?

The visitor to the Bushey School cannot fail to be struck by the absence of all that paraphernalia which one finds in the humblest school that derives support from the Science and Art Department. There are none of those casts of which the cost is a burden to a committee, and the care a task to an attendant, and which chill and cramp so many students. We are still afraid of colour in this country, and not so long ago we saw virtue in whitewash; characteristically the authorities try to foster our colour sense by filling

art schools with white casts, and send young men who are brought up in this way to teach the Easterns how to apply colour scientifically. In the Bushey School the living model is "the end all and the be all." Professional models are brought down and live on the premises for a week, to be succeeded by others. The risk that ensues from servile copying from one figure is therefore avoided. It may be mentioned that one cast is seen, the splendid *Teucer*, by Mr. THORNYCROFT, which a Greek might be proud to claim. It is Mr. HERKOMER'S desire to put similar examples of art before his students—not to be copied, but as a source of inspiration. He has no difficulty in obtaining them, and on the day we visited the schools the examples shown were some vigorous pencil drawings which had been sent from Herr MENZEL.

It will be objected that few students are competent to enter upon so advanced a course. The students are in fact picked, and are not allowed to continue in the schools unless their competency is evident. But it is by no means certain that it is necessary for a student to be able to draw in black and white equally well with a French lithographer before he is qualified to take up painting. Preliminary grinding is supposed to be the basis of all kinds of education in this country, and it is so effectual that a good many lose all desire for more of another sort. In an ordinary English art school the students are wearied long before the oil-painting stage is reached. "Paint your studies instead of drawing them," was the advice of REYNOLDS; "by a short struggle of resolute industry the same expedition is attainable in painting as in drawing on paper," and it is this principle which is recognised at Bushey. But we understand that the experiment of an elementary class, in which of course drawing will be predominant, is to be tried in a month or two.

As care is taken in the selection of the students, it may be expected that in a little time the school will be surrounded with that atmosphere of floating knowledge on which REYNOLDS, like all teachers, placed so high a value. It was valued by the President because he believed that by means of it "every mind may imbibe somewhat congenial to its own original conceptions." There is more chance of such a result being secured at Bushey from the versatility of the master than there was in the Academy in Pall Mall. Mr. HERKOMER can do so many things that one is induced to credit the stories which are told of the men of the fifteenth-century. He is a painter of portraits, figure pieces, and landscapes; a carver, an etcher, a mezzotint engraver, a wood-draughtsman, a smith, a metal-worker, and could make a living by music or lecturing. A man so varied is equal to a staff of professors, and is likely to discover almost by instinct what is most congenial to a student. If a young fellow whom Nature intended for a sculptor or an engraver enters the school as a painter, there is not much chance that he will lose his time in fighting against himself. He is brought into contact with art in so many forms that if a genius for one kind more than another lies hidden in him it is sure to be revealed.

The school has gained the good wishes of many English and foreign artists, and as an effort to secure for the English student whatever is best in the Continental atelier system, it is deserving of the success which its projectors have desired.

## LANDSCAPE IN ART.\*

EVERYONE who has read the books called "Cadore, or Titian's Country," and "The Dolomite Mountains," will welcome the new volume by Mr. GILBERT. The subject is of extreme interest, and has to do with much more than painting. It relates likewise to descriptive poetry and to the history of human development. In fact, an upholder of the theory of evolution could hardly discover anything that is more convincing to him than the difference which exists between the representations of landscape as they are found in ancient and modern paintings and poems. The architecture and sculpture of the Greeks are held to be superior to modern works, but it cannot be said that Greeks or Romans were more sensible to the beauties of

\* "Landscape in Art before Claude and Salvator." By Josiah Gilbert. John Murray.

nature than the English, or were better able to depict them by words, lines, or colours.

It is the object of Mr. GILBERT's book to explain the progress which has been made in the course of centuries in landscape art; but it seems to us that a comparison of two parallel passages from a Greek and an English poet will suggest the difference between the theories which inspired art and literature then and now. Let us take first the "Prometheus" of ÆSCHYLUS. The victim in his soliloquy, after he is bound to a mountain in the Caucasus, cries out:—

Ethereal air, and ye swift-winged winds !  
Ye rivers springing from fresh founts, ye waves  
That o'er the interminable ocean wreath  
Your crisped smiles, thou all-producing earth,  
And thee, bright sun, I call, whose flaming orb  
Views the wide world beneath, see what, a god,  
I suffer from the gods !

This invocation is fine, and to a Greek who heard it spoken on the stage, earth, air, and water became powers endowed with life. But now let us see how SHELLEY in his "Prometheus" treats the scene:—

The point of one white star is quivering still  
Deep in the orange light of widening morn  
Beyond the purple mountains : through a chasm  
Of wind-divided mist the darker lake  
Reflects it : now it wanes : it gleams again  
As the waves fade, and as the burning threads  
Of woven cloud unravel in pale air :  
'Tis lost ! and through yon peaks of cloudlike snow  
The roseate sunlight quivers.

It may be said that an audience could follow the Greek tragedian's description, while SHELLEY's has to be read more than once before all its beauties can be realised. It is not, however, dramatic fitness that comes in question. What we contend is that the invocation of ÆSCHYLUS is a type of what is found in Greek literature, and that although a factitious animation is given to phenomena, all that form and colour which constitute a landscape are ignored. Colour is so rarely recognised that there is some ground for starting the theory that the Greeks were colour blind. The low condition of landscape painting in the palmy time of Greek art may be inferred from a passage in the "Critias" of PLATO, in which he says that people are satisfied with the most distant resemblance to mountains, rivers, and forests, and that nobody either examines or criticises paintings of the kind. In other words, the Athenians were satisfied with scenery which, if reproduced in a modern pantomime, would be hissed by the spectators in the gallery. Dr. WOERMANN has concluded from allusions in one of the tragedies, that the deep and delicate feeling for nature which is found in the poetry must have been aided by the resources of the painter's art. But in respect of landscape-painting the Greek spectators do not appear to have been in any better condition than those in an Elizabethan theatre, who were expected to piece out the imperfections of the stage by their thoughts.

The Pompeian landscapes probably show a very advanced state of Greek art. Mr. GILBERT deals gently with the imperfections, but he has to own that the rocks are lumps of matter, that clouds are omitted, and that there is no trace of trees like the stone pine which was to be seen about the city. The artists were evidently most dexterous in producing their pictures, and their shortcomings are less excusable. The Pompeian wall painters were aware of the importance of affording pleasure to the eye, and, accordingly, "it is pleasant habitable scenery that is preferred for decoration, telling of the time when the Italian people, all the world their own, dwelt at ease amidst fields and groves and vineyards, and along the sunny strands of their own Italy, busy with nets and boats enjoying the cheerful scene."

The trees which are found on the walls of the villa of Livia are signs that landscape-painting of a somewhat veracious kind was produced in Rome. The work was intended to suggest a garden; the branches of the trees are interwoven, forming a kind of trellis, and "the whole is painted with a vigour, precision, a glow of colour, and a clever cast of light and shade which are simply amazing." A wall-painting which survived at Palestrina until the seventeenth century, but is now known only

by means of an engraving, is supposed to represent a Nymphæum, or haunt of water deities. It is simply a collection of fantastic rocks and buildings, but it must have been interesting as an early example of a kind of manufactured landscape which prevailed in Europe until comparatively modern times. Works of this class can always be useful to geologists who are desirous to show the consequence of ignorance of their science. In the pictures from the "Odyssey" found on the Esquiline in 1848, and which are now in the Vatican, there is more of this ancient rockwork, combined with a clearer recognition of landscape effect, but the conclusion has to be drawn by Mr. GILBERT that "the spirit of nature in her finer moods, the play of light and shade and colour, the witchery of cloud effects, the pathos of evenings and mornings, of spring-tides and autumns—to apprehend all this and to give it pictorial expression was reserved for the art of the modern world."

It is remarkable that, in the writings of the Greek Fathers, HUMBOLDT found passages which express delight in natural scenery. CHRYSOSTOM anticipates COWPER in preferring nature to art, and bids his hearers to turn aside from the glittering buildings with their ranges of columns to the fields and the sky. The pastoral images in the New Testament which are depicted in the Catacombs might be considered as likely to lead to the creation of a class of art among the early Christians, in which landscape would assume more importance than an accessory to figures. A tree in St. Vitale at Ravenna of the sixth century shows, according to Mr. GILBERT, who has examined it with a glass, undeniable study of nature; "but the foliage is composed (like that of Greek sculpture) of large single leaves, similar to those of the sweet chestnut, showing, along with a certain faithfulness to nature, great lack of the power to generalise; the Classic freedom of foliage is gone." In the scenes which were represented, part of the action at least often takes place in the sky, but the artists completely failed in their attempts to suggest the appearance of clouds.

The early illuminators were as conventional as the mosaicists, and the trees were sometimes not unlike those which are found among Swiss toys of the cheapest class. Then the art fell into the hands of the Celts and Germans. We have always maintained that the origin of the interlaced ornament which is known as Scandinavian or Celtic, was among the monks who were adorning manuscripts. It is a style which is more likely to arise with men who were under no restraint from intractable materials, and could allow their fancy to run into elaborate intricacies of form, than with metalworkers or carvers of ivory or stone. Mr. GILBERT is of the same opinion, and describes the art as "elaborate ornamental penmanship, in forms derived in the first instance from those primitive combinations of plaits, knots, and chequer patterns which belonged to ancient needlework." In course of time the artists attempted the representation of flowers, and there are occasional examples of trees which appear to have been drawn from life. In a Bible of the ninth century in the British Museum there are trees which are "eminently natural," along with others which are unlike anything that ever grew. The difference may have arisen from the employment of several monks on the work. With the rise of Gothic architecture it was inevitable that the example of carvers who went to the fields for patterns should gradually lead to the abandonment of stereotyped forms among the miniaturists. For the diaper background a sky was substituted, and landscape forms were introduced. The struggle with conservatism, which marks all times of transition, can be seen in a fourteenth-century Bible in the British Museum. In the drawing of *Jacob Wrestling with the Angel* there are trees and grass, with a red diaper background. In the *Translation of Elijah*, the prophet in a four-wheeled cart, which is drawn by two horses tandem, ascends from the earth, not into a blue sky, but into chequers. On the abandonment of diapering, the French seem to have adopted skies which were intensely blue, while the Flemings used tender and more aerial tints. Artists of both nationalities appear to have been employed on the illustrations to the poems of CHRISTINA of Pisa, in the Harleian Collection, which are considered to present some of the earliest specimens of genuine landscape painting. In this manuscript, and others of the time, one feature is the peculiar rows or frill forms which do duty for clouds. It has been suggested

that they are allied to the heraldic nebuly or wavy lines which we see on some shields. They are so characteristic of Gothic art that Mr. BURGESS employed them to express clouds in some of the sculpture in Cardiff Castle.

For a long period the landscape-painting of Europe might be said to be as conventional as heraldic figures. The rocks, trees, clouds, have as much relation to nature as supporters have to real animals. Even when the figures were derived from living beings, it was not considered necessary to go to the fields for a background. It was not until the sixteenth century that the revolution was commenced which is still in progress.

(To be continued.)

### THE ARCHITECTURAL ASSOCIATION.

THE ninth ordinary meeting of the Association was held on Friday evening, the 6th inst., Mr. Cole A. Adams, president, in the chair.

Mr. ATKIN BERRY, hon. secretary, said that he had given away all the tickets he had received for the course of lectures at Carpenters' Hall, but thought there would be no difficulty in getting tickets for any of the lectures following Professor Kerr's of the 11th inst.

Mr. A. YOUNG then read a paper, from which the following is taken :—

#### Farm Buildings.

Mr. Young said :—Having arranged the yards, the next point to take into consideration is the aspect, as it is essential to place the buildings so in relation to the crew-yards that the stock fattening shall get the benefit of all the sun that can be obtained, and be sheltered from the cold winds. The buildings should, therefore, be on the northern and eastern sides of the yards, and the sides to the south and west left open. The level of the yard should be about two feet below the level of the stable pavement, and should be made as impervious as possible by well ramming and clay puddling so as to keep the straw-bedding, &c., in the yard as "good" as possible. In the yards provision should be made for drinking-water for the stock, and if this can be running water so much the better; for an overflow pipe to keep the yard sufficiently drained is a necessity. In disposing the various buildings round the yard, it is best to place the following within easy distance of the farmer's house or bailiff's cottage: the nag-stable, gig-house, and harness-room, the calf-house, and the infirmary box. About 18 feet by 14 feet is a good average size for the gig-house, and about half that width for the harness-room. A small loft is usually arranged over in which a small supply of corn is kept, along with apples.

Taking the buildings in the rotation plan before us, we next come to the calf-house, which, in an ordinary way, is simply a large box about 18 feet square, with a low manger on three sides, divided up by wooden palings into pens of about 6 feet square. In larger buildings it will sometimes form a detached building, with, perhaps, a tramway running down the centre for convenience of feeding, with the pens on each side, and a gangway all around of about 4 feet. With this arrangement the floor is sometimes sunk about 2 feet 6 inches, and I have seen a very simple and ingenious contrivance for altering the height of the manger daily as the bedding gradually becomes raised, so that the calves can get at their food without difficulty, but an ordinary iron trough answers all practical purposes. The internal temperature of the calf-house should be kept as even as possible, and it is better to build them with hollow walls. I need not add that no loft for hay or any other fodder should be placed over any cow-shed or similar building, as the hay is not by any means improved by the exhalations of the cattle, and the risk of fire is intensified. The most impervious floor is the best, and I advise any of the many forms of Portland cement concrete—whether called granolithic, imperial stone, or Wilkinson's patent concrete, is immaterial—so long as the cement is really good and the granite chips and shingle clean. I can speak in high terms of Wilkinson's work from practical experience.

The cowhouse may next be described. It is a great point here, as well as in the calf-house and stable, to insure an equal temperature and perfect ventilation. Where the buildings are of brick, hollow walls will be of great assistance, care being taken to have a thoroughly effectual damp-course of slates in cement and two or three courses of brickwork, also cemented under, to keep out the mice and rats, the great enemies of the farmer, as far as his buildings are concerned. The usual width of a cowhouse is about 18 feet; this allows of a feeding-passage at the back of the mangers of 4 feet. The floor should slope very slightly towards the heels of the cows, and there should then be a drop of 4 inches into a surface-gutter about 1 foot 6 inches wide, and the remainder will form the usual gangway.

It is not necessary to divide the building up into stalls, but it is better to do so at the manger. This is done in the simplest way with oak paling. The mangers should be constructed of some hard and impervious material. There are very good purposely-made glazed terra-cotta bricks for this purpose. Hard blue Staffordshire bricks also do very well, but one of the simplest and best mangers is formed by using the large-sized half pipes, of glazed stoneware used for drainage works, bedded on concrete, and having an oak capping. The joints are fewer and easier made than with the other materials mentioned. Again, the simplest methods of ventilation are the best, and the system I recommend is to carry up a large trough of wood, about 2 feet 6 inches broad at the base, gradually decreasing to about 1 foot 3 inches at the outlet, and having a plain cap at the top. The sides should be formed in two thicknesses, and the spaces between filled with sawdust. Sufficient air will find its way in by the door and windows to thoroughly change the air in a very short time. One ventilator in about every 15 feet of length will suffice. The doors of a cowhouse should always open outwards, and should not be less than 4 feet wide; 4 feet 6 inches is a better width, and sliding doors are best. But here again the question of cost will probably intervene. I may say here that it is better, if possible, to use nothing in the way of hinges or bolts, &c., except the strongest, and those only that can be made or repaired, if necessary, by the village smith. Avoid complicated patents. The windows should be placed at such a height that if the upper portion is glazed it cannot be reached by the horns of the stock in the yards. The old-fashioned hit-and-miss window, strongly made in wood, is as good as anything, and if with a small quantity of glass over will answer every purpose. Where the glass is omitted in the windows, a few glass slates or tiles in the roof will be of use. Cast-iron hit-and-miss windows can be obtained from many founders. The cost of one, 3 feet 6 inches by 2 feet 6 inches, will be about 25s., list price.

We next take in hand the stable. There is little to say about it that has not already been mentioned in describing the cowhouse. The stall divisions, which should be about 9 feet deep, should be about 6 feet 3 inches apart centre to centre, and should be thoroughly strong; the mangers should be much as described for the cowhouse, but one must bear in mind that the horse is rather a dainty feeder, and has a very strong objection to dirt. Therefore, to avoid waste it is a good thing to have the mangers of some materials easily kept clean, and here, again, any strong glazed ware will be found the best. A cart-horse stable should be, at least, 18 feet wide, and that dimension is quite sufficient. But it must be borne in mind that the harness, &c., is frequently kept in the stable (although this is a bad thing to do), and provision should be made for, at any rate, temporarily placing the saddles, &c., on rests until they can be put away in the gear-house.

As regards ventilation, the same as I described previously for the cowhouse will answer admirably. Avoid, if possible, any cross draughts, and if you are obliged, as may sometimes happen, to put either windows or ventilators in the same side as the mangers, keep them as high as possible. I do not think, even in the best stables, it is a good thing to lay on water to the drinking-pot forming part of some iron mangers. A horse will drink with much greater zest from a freshly-drawn bucket of clear water than from a slimy trough that may have been standing for days, and it is more natural for a horse to drink from the ground-level and not from a raised trough; he can get his nose much better into the bucket. If you are compelled, from motives of economy or want of space, to place lofts for hay or corn over the stable (only do so when you are absolutely obliged) be sure and have the loft-floor of cement. The old plaster floors cannot be beaten for this purpose as they are rather warmer than a Portland cement concrete; but in ordinary farm buildings it will rarely happen that you will have to place lofts over any of the buildings, but in hunting-stables and those attached to country houses the architect is obliged to put his lofts on the upper floor, and this arrangement has many conveniences; but, wherever possible, put lofts over coach-houses, harness-rooms, &c., and only put a passage for service over the stable. I fancy, as a rough rule in large stables, about half of the superficial area of the stable would give the requisite amount of floor-space for the lofts. Mice are troublesome amongst the corn. It is a good thing, where they are very destructive, to cover the floor and line the walls with thin zinc. The harness and gear-house should be placed as near to the stable as possible, and should be about 8 feet wide, and should have a fire-opening and flue, as here the farm labourers who are not boarded occasionally sit to take their "bit on the thumb," and it is frequently useful to be able to make up a fire quickly to heat a bran-mash or boil food for the pigs; and a fireplace here saves a journey to, and gossip in, the farm-kitchen. Harness fittings should be of the strongest and rudest description; there is nothing better than strong oak pegs, built well into the wall. The gear-house should have a good-sized window.

A small space should also be provided for storing, under lock and key, artificial manures and oil-cake. The floor of this department should be of wood, with about half an inch between each board, and plenty of ventilation under, as oil-cake very quickly gets mouldy, and requires to be kept in a dry and well-ventilated place. Between the stable and the cow-house is the best situation for the root and chaff-cutting place; in small farms an area about 12 feet by 18 feet will do, but in larger ones these dimensions should be increased. As the roots will probably be stacked and bedded on the opposite side of the stable range to the crew-yard, it is necessary to have a door at both ends of the building. In the ordinary way, of course, the machines will be worked by hand, but on large farms, and in other cases where steam-power is used for other purposes, the chaff-cutting, pulping, &c., will be done by steam-power. In this set of buildings the same engine, one of about 10 horse-power, drives, works the sawing-machine, and also does the chaff and root-cutting, &c., the gearing being interchangeable.

The barn, now partly I suppose by the greater facility with which farmers now dispose of their produce, and partly also from the fact that much that was formerly placed in the barn is now kept in separate places, is generally built very much smaller than used to be the case. Thirty-five feet to 50 feet by 20 feet will nowadays be considered a good barn. It is usual to put the doors of such size that a waggon can be driven through it, and about a third of the barn has a sort of loft over. Cement makes the best floor, and it is a good thing to render the walls in cement for about 5 feet in height all round. Sufficient ventilation is gained by putting a few air-slits, which should be covered with bird-netting to keep out intrusive sparrows.

The PRESIDENT observed, in regard to the depression of the times, that the construction of farm buildings had of late years been studied from a more scientific point of view, with the object of erecting them in the most economical manner, and so as to give the maximum of accommodation and usefulness in a minimum of space. The President further added some remarks explanatory of a dairy farm which he had carried out, a plan of which was exhibited by Mr. Young.

Mr. W. H. PRATT proposed a vote of thanks to Mr. Young for his paper. He inquired if concrete cement paving answered in stables, and whether it afforded sufficient foothold to horses. Farm buildings in their simplicity and picturesqueness had a claim to the interest of an architect, even though few might be called on to design them. He said he should be very sorry if the cutting-up of holdings led to the adoption of one uniform pattern for all farm buildings. There was nothing particularly picturesque about model farms, and they would considerably mar the beauty of any fine scenery in which they might be erected.

Mr. H. G. TURNER seconded the vote of thanks. He said his experience as to concrete floors was that they answered perfectly, gave a good foothold to horses, and were cheap. As to constructing farm buildings of concrete, it might answer if they had to put up farm buildings all over a large estate, as a set-off against the cost of the plant necessary, and the trouble of getting men accustomed to this particular work.

After some remarks from Mr. Blagrove and others, the vote was carried by acclamation.

Mr. YOUNG, in his reply, remarked that no farm buildings could be more picturesque than a group of Sussex farm buildings. Picturesqueness must, under the circumstances, be got from the utmost simplicity of construction. But, of course, if one had to lower the roof pitch, and the like, all picturesqueness would be lost.

## THE GLASGOW INSTITUTE OF FINE ARTS.

THE twenty-fourth annual exhibition of the Glasgow Institute of Fine Arts has been opened. The president, Sir Peter Coats, to celebrate the event gave a banquet, at which several artists were present. The duty of proposing "The Glasgow Institute of the Fine Arts" was assigned to Professor Jebb, of Glasgow University, who spoke as follows:—

In rising to propose the toast with which I have had the honour of being entrusted, I am very conscious, indeed, that it could have been proposed with far more knowledge and ability by gentlemen whom I see here to-night, and to whom I should have been prepared to listen. I will frankly say that I feel very much gratified at the same time by having been asked to propose it, and that it gives me peculiar pleasure to do so, not only for a personal reason, but also for a reason associated with the ancient Glasgow Institution with which it is my privilege to be connected. In days long gone by—in the last century—Glasgow College, at its old home in the High Street, was the scene, I believe, of the earliest art exhibition ever held in Glasgow; and now that the opportunities for the display of art among us have attained a development as much in advance of

those early attempts as the Glasgow of the present has surpassed the wildest dreams which could have been formed for the Glasgow of the past, it must naturally be a source of especial pleasure to any one connected with the university of this city to take a part, however small, in congratulating our host, the president, and his colleagues in the administration of this Institute on a success which the walls of these noble galleries declare in tones more eloquent than speech. The Institute was founded in 1861 for the purpose of promoting the knowledge and enjoyment of art throughout the West of Scotland, and it has endeavoured to attain that object especially by means of its annual exhibitions. This exhibition is, as you are aware, the twenty-fourth of the series. It is probably safe to say that there is no exhibition out of London in which the general quality of the work exhibited is higher than in this Institute. The labours which the honorary officers of this Institute have now conducted so unselfishly and so efficiently for well-nigh a quarter of a century are, I will venture to affirm, among the most patriotic and beneficent labours that any body of men could undertake. They have not been ministering merely to the pleasure of the wealthy and cultivated few; they have been doing an educational work of the highest value to the community at large; and a work I believe it might be added which, in certain respects, has no unimportant bearing on the manufacturing interests of this great city. There never was a time in the world's history, probably, when the soothing influences of art were more needed than they are in our day. You may, perhaps, remember the lines in which Mr. Matthew Arnold describes the great German poet's feeling about art in the years when the eighteenth century was drawing to a stormy close amid the perturbations, political and intellectual, of an age which had suddenly broken so many of the links with the past:—

He looked on Europe's latter hour  
Of fitful dream and feverish power;  
He said, the end is everywhere—  
Art still has truth—take refuge there.

The nineteenth century is drawing to its close under different and happier conditions. Art is no longer needed, in Goethe's sense, as the refuge of political and speculative despair. We look back on a period memorable for the wonderful changes which the discoveries of science have effected in the material life of man; but these very changes have made life more rapid, more exciting, and more exhausting. Day after day that electric chain with which the world is, in no figurative sense, bound vibrates with all tidings that can stimulate the brain and stir the heart. Is it necessary to say more, when we all know the emotions of honour and indignation against enemies of the human race—the feelings of pride in our unsurpassed heroes, and of sorrow for the brave dead which the last few days have brought? If the world no longer needs art as a refuge, it needs it more than ever as an ideal region of repose and refreshment, in which the weary brain may find relief and the jaded nerves may regain their elasticity. Nothing speaks more significantly for this Institute than the fact that Glasgow has now a local school of painting, and that gentlemen representing it hold so many places of honour among the artists of Britain and the Continent, whose works adorn these walls. It may be permissible in addressing this distinguished audience to re-echo a hope which is very generally felt, that the local school may receive its due share of local encouragement. The President of the English Royal Academy referred the other day to the sincerity of Scottish art. If that is one of the qualities of the Scottish artist, the co-relative quality in the Scottish connoisseur should be independence of judgment. Art criticism has done much excellent service in disseminating a knowledge of the principles of art. But the educated public of this country have now reached a stage, in matters of art, at which what is needed is rather, perhaps, more courage in the exercise of intelligent private taste. If one admires a picture, one ought not to be afraid of saying so; and it is also well to remember what Dryden said—"They mistake the nature of criticism who think that its business is to find fault." In art, as in literature, the picking of holes is not criticism; the higher and better office of criticism is to appreciate what is good or hopeful in work, pointing out, when needful, how it can be made better still. Speaking on the banks of the Clyde, and in the neighbourhood of the Trossachs, I cannot help recalling some eloquent words of the greatest living English art critic, because they nobly express that eternal alliance between the beautiful and the useful which in a great commercial city like Glasgow it is always well to remember, "the strong torrents which in their own gladness fill the hills with hollow thunder and the vales with widening light have yet their bounden charge of field to feed and barge to bear; the fierce flames to which the Alp owes its upheaval and the volcano its terrors temper for us the metal vein and warm the quickening spring; and for our incitement, I say not for our reward—for knowledge is its own reward—herbs have their healing, stones their preciousness, and stars their times." But

I fear that I have already incurred the charge of neglecting an art, which, if not exactly a fine art, has some points of analogy with it—the art of brevity. In conclusion, then, I will only venture to express my strong sense of the debt which all lovers of art in the West of Scotland owe to the president of the institute, Sir Peter Coats; to the secretary, Mr. Robert Walker; to the treasurer and to the council for the sustained efforts which they have so unselfishly devoted to the interests of art, and which have produced the admirable results which we see around us this evening.

### FYVIE CASTLE.

AMONG the Scotch properties which have recently been brought into the market, says a correspondent of the *Times*, not one, perhaps, has been more worthy of notice than Fyvie, which is now being offered for sale. Aberdeenshire is rich in fortified baronial residences of more or less pretensions. Fyvie Castle is by far the noblest of them all. In fact, with the solitary exception of Glamis, there is nothing in Scotland that is finer in the style. Originally a strongly-fortified quadrangle, there are now only two sides of the square remaining, but with the great additions which have been made by successive occupiers each side presents an imposing front. Billing, in his "Baronial Antiquities," goes into raptures over the place. He calls Fyvie "one of the noblest and most beautiful specimens of the rich architecture which the Scottish barons in the days of James VI. obtained from France." And, indeed, looking up at the lofty south front, with its long façade of 150 feet, you might easily imagine yourself in Touraine and on the banks of the Loire. Many architects had come over to Scotland from France with Mary of Guise and her unfortunate daughter, bringing French ideas and designs; and in the reign of James VI. Fyvie chanced to be in the possession of a prosperous statesman with a mania for building. The first Earl of Dunfermline built almost as indefatigably as old "Bess of Hardwicke" herself; he spent large sums in beautifying ecclesiastical edifices; he built at Pinkie House, in East Lothian; and there can be no question that he must have engaged the services of one of the Frenchmen in the great additions he made to his Castle of Fyvie. The "Seton Tower," which bears his family name, forms the centre of the south front, and everything about it is in the purest style of the period, with a bold but graceful originality of design. The arched doorway, which in former times was the grand entrance, is in a deep recess between two tall semi-rounded twin towers, spanned by a corresponding arch above the fourth storey. Stones bearing the Seton arms, impaled with those of the Chancellor Dunfermline's wives, are inlaid in the massive masonry of the walls. But the Seton Tower is only one among others which form the angles of the building, and, though the richest in ornament and the most imposing, is perhaps not the most interesting. There is the Preston Tower, which is the oldest of all, dating from the beginning of the fifteenth century; there is the Meldrum Tower, which comes next in point of time; and, finally, there is the Gordon Tower, which is in keeping with the rest, though very modern by comparison. The whole of the work, whether ancient, mediæval, or modern, is of immense strength and solidity. The walls are generally from six to eight feet in thickness; in some of the most recent additions the masonry may be nearly twice as deep. It is clear that stone is cheap in that country; nor could labour have been costly when coin was scarce. But everywhere here, as in similar though smaller fortalices in Aberdeenshire, we see evidences of taste we should hardly have expected. The castellated defences of former centuries, in the turrets, the bartizans, and the battlements, are harmoniously blended with the ornaments of domestic French architecture, with the projecting gables, the lofty chimneys, and the carved canopies covering the dormer windows. I may give an idea of the imposing general effect by saying that one at least of the corner towers is seven storeys in height from base to battlement. A characteristic feature is the rude statuary, wrought in the red sandstone of the district, by which several of the turrets are surmounted; and there are quaint or grotesque heads in red sandstone let into the outer walls. These roughly-chiselled busts which top the turrets have nothing in common with the life-size figures on the battlements of Alnwick Castle; but they chime in harmoniously with the general design, and one of them at least has a romantic local interest. It is the effigy of Andrew Lammie, the trumpeter of Fyvie; and the melancholy memory of his love for the fair maid of the neighbouring mill of Tiftie is commemorated in a pathetic and popular ballad of portentous length.

The interior of the castle being as massive and as venerable of aspect as the exterior, it might be supposed that if it is a picturesque it must be an uncomfortable residence. As I have already remarked, however, that is far from being the case. On the contrary, thanks to the latest additions by the Gordons, the sitting-rooms are exceedingly bright and habitable; while hospitable proprietors could entertain any reasonable number of

guests in more or less commodious bedrooms. But everywhere you have all the piquancy of sharp contrasts. The present entrance opens into a modern antique hall, where perhaps the most striking object is the enormous brazen lock and key, which might assure the solid doors against anything less formidable than a battering ram. Thence we ascend to the suites of the principal rooms by the magnificent staircase built by Lord Dunfermline. So far as I know, there is nothing in Scotland to rival that staircase, and I should suppose that it is unique in its style. It is no less than 24 feet in breadth; it revolves in corkscrew fashion round a massive central pillar, and the ascent by the long low steps is so easy that it was said that the laird's horse might walk up them without a stumble. But the skill of the architect is chiefly shown in the turns and windings of the ribbed and vaulted roof, with its arches springing occasionally out of carved capitals in the walls, while the impression, in my opinion, is heightened rather than the reverse by the vaulting being low rather than lofty. This is but one of many minor staircases, and the rooms in the towers and the connecting corridors in the body of the buildings form a labyrinth in which a stranger might easily lose himself. Climbing the stairs, turning the corners, and opening the doors at random, you draw upon a lottery of surprises. You may be in a small, circular chamber, with narrow slits in shape of windows admitting faint glimmers of light. You may be in a spacious and very comfortable bedroom, with light and to spare, and all modern conveniences. Or you may be landed in one of the great public rooms, the principal of which are large and lofty, while all command extensive views over the park. The dining-room, which is one of the latest additions, is not only of great size but an admirably proportioned apartment, lighted from three of the sides by five noble windows, and showing to great advantage the full-length portraits on the walls. Almost a square, it is so excessively roomy that the laird before the last could indulge his favourite habit of having a table for 18 guests drawn to one end and placed horizontally in front of the fireplace. There is less elbow-room in the library, which is in one of the older buildings; but the recluse of Monkbarrow would have delighted in it, with its two little side cabinets, which have literally been almost quarried out of the thickness of the walls.

Talking of antiquaries and antiquities takes us naturally down to the dungeons in the venerable basements, to the charter-room, and to the secret chamber. The dungeons, as at Glamis, are still kept under lock and key, but they have been fitted up with wine-bins and contain bottles instead of captives. The charter-chamber, in the bottom of the Meldrum Tower, with its more precious treasures in their fireproof safe, is still more carefully secured—at least, in the absence of the proprietor—though in the time of the late Colonel Cosmo Gordon it was occasionally used as a smoking-room. In Scotland, with the troubled story of its perpetual feuds and frays, sack and sieges, such an unbroken series of charters as that preserved at Fyvie must be rare indeed. The earliest of these documents dates from the end of the fourteenth century.

Immediately beneath the charter-room is the secret chamber—secret, at least, so far as anything it may contain is concerned, for there is no doubt as to the exact locality. Apparently it has never had either door or window, which makes it most improbable that it should have been intended for the concealment of arms, as is suggested in an old plan. Superstition has hitherto held curiosity in check, for it has been guarded by a heavy curse against any one who should intrude on its mysteries. As interesting, in a different way, is the massive iron gate or grating which defended the principal entrance in the Seton Tower. It is hung in the low, vaulted passage a few feet within the outer door, which was of oak and heavily clenched with iron nails. The most ponderous in Scotland, with the exception of that at Drumlanrig, in Dumfriesshire, it is as remarkable for its workmanship as for its size and weight. The horizontal and vertical bars are ingeniously interlaced, each being welded alternately around the other. Considering the enormous mass of the metal, it swings lightly on its hinges, and the heavy bolts that secure it to the opposite wall can be pushed or drawn with a couple of fingers. In short, it is an exceptional specimen of the ordinary defence of the old Scottish fortalice, or peel-tower, which the author of "Waverley" has described in his "Monastery," when the practised skill of the reiving rider of the Clithill extricated the imprisoned inmates of Glendearg. In the centre of the arch and over the doorway is the deadly aperture, styled "the murder hole," whence missiles or boiling fluids might be rained down upon assailants.

**An Alpine Railway** between Chur in the Upper Rhine Valley and Biasca in the Lake Tessin district is projected. The line, which would be 61 miles in length, would have to be carried through the Luckmanier chain by a tunnel 13 miles long.

## THE ARCHÆOLOGY OF CHESTER.

AT the banquet which followed the laying of the foundation-stone of the new museum at Chester, of which Mr. T. M. Lockwood is architect, the following speech was delivered by Sir James Picton, F.S.A.:—I am asked to respond on behalf of archæology. Now, what is archæology? If I were a School Board scholar, I might say it was something about the fishes or beasts of the field, or something perhaps quite as irrelevant. But archæology has been defined. I think allusion was made to it a short time ago by the Most Noble the Duke of Westminster as "history in stone." Well, so it is; but it is something more. History in stone would only apply to the building and outer structure, but archæology has a wider scope. I should say that archæology properly understood is the "outward visible sign of the inward spiritual grace" of history at large. Now Chester is peculiarly privileged with regard to its illustrations of archæology. I don't know that we could find a city or town in the United Kingdom that affords more scope for archæological research and questions relating to antiquity. If you will permit I will just call attention to a few of the points upon which Chester affords some of the most valuable illustrations. First, I would call your attention to the old coast line. I don't know whether the attention of most of those present has been called to that, but it is a most interesting question to pursue, and for that reason I would advise you to take it up. What I mean by the old coast line is that line of cliffs which forms the boundary of what was formerly the estuary of the Dee, which formerly came up to the very side of the city of Chester. It is easily traced; you will see it on the map. That was of course long before the period of written history. When the Romans approached this locality, founded the city of Deva, and planted the victorious 20th Legion here, there cannot be a doubt that the estuary of the Dee extended in a wide sheet of water round two sides of the city. That is tolerably evident from the formation of the ground. Well, here the Romans came, and when we look at the city of Chester even in its present state, we find there are more evidences of Roman construction than in any other city I know of in the United Kingdom. You have the *Pretorian* gates, the *via Devana*, connecting it with the citadel where the Castle now stands. You have discovered also many Roman remains within the precincts of the walls of this city. Then there comes a break in the history of Chester—a period when the Roman dominion had passed away, when the city had been destroyed by the victorious Saxons, leaving it in ruins for generations. Of that period we are not without some interesting remains. Within a very few miles of Chester you have got the termination of Offa's dyke, which was thrown up, as you know, by King Offa for the purpose of separating the English and Welsh populations, and preventing the incursions of the wild Welsh. It is a very interesting fact that in the present day, 1,000 years after Offa's dyke was constructed, the line of that dyke pretty nearly conforms to the line of separation between the English and Welsh-speaking people. Although it is now a little out of the date, I may be permitted by way of parenthesis to allude to the very interesting ruin of Flint Castle, which lies between this place and the termination of Offa's dyke. It is familiar, too, from the account in Shakespeare how Richard II. came there and was detained by Henry Bolingbroke. You all remember the interesting lines in which Shakespeare commemorates that. There it stands, an archæological remain, left in the midst of the tall chimneys of alkali works, and lead works, and other abominations of that kind, bringing down to our day the recollection of a period when in England the feudal system was in its full vigour, and when some of the most interesting transactions in the history of our country were performed. Then we come down to the Middle Ages. The most important building that remains from that period in Chester is the cathedral. There I have a word or two to say. Chester Cathedral, as you all know, was not built for a cathedral. It was built for an abbey church, but I don't know any cathedral in the kingdom that possesses more elements of interest and points of architectural association with the various times than does Chester Cathedral. You have got in it examples from the earliest Norman down to the latest Perpendicular and Tudor—specimens in fact of every style of architecture that ever prevailed in the country. Here it is only right to repeat what has often been repeated before, and I hope will be often repeated again, that a debt of gratitude is owing not only from the city of Chester, but from the whole diocese and the country at large, to the Very Reverend the Dean, for the energy and success with which he got up the fund for the restoration of the cathedral, and the tender and loving manner in which he looked after the execution of the work. I don't think there has been a restoration throughout the kingdom which has been on the whole so perfectly satisfactory as that of Chester Cathedral. I say he treated it with a tender and loving hand—that is to say, he destroyed nothing that could possibly be preserved, and wherever it has been necessary to restore, it has been done as much as possible in exact consistency with what had been done before. Whenever I

come into Chester and have half an hour to spare, I go into Chester Cathedral to contemplate the beauties to be found there, and to reflect upon the excellence of the works of former days, and whenever I go there I recognise with gratitude the noble work of the Dean, which is, I believe, appreciated by the citizens of Chester, who recognise their indebtedness to him. It was said that Alexander, when he had completed his conquests, wept because there were no more worlds to conquer. It appears our worthy Dean is in much the same condition. He has restored Chester Cathedral, and now he pants for another similar work to do. Accordingly he has taken up this work of our Archæological Museum, and if there is any man in Chester capable of succeeding in the enterprise, it is, I am sure, our worthy Dean, and I wish him every success in it. We come now in the Middle Ages to the quaint old street architecture of Chester. There is nothing like it in the kingdom. There are in many towns and cities in the kingdom fine old houses scattered here and there, but for a continuous range of Mediæval buildings such as there are in the streets of Chester, I know of no comparison anywhere. There are two things characteristic of the Middle Ages which belong to Chester which are specially interesting. I mean the continuous walls round the city and the Chester rows. With regard to the walls, in their circuit they are absolutely continuous. It is very much to be regretted, but I suppose it is in accordance with the ideas prevalent at that time, that the old gateways have been disturbed. At York, you are aware, they have preserved the old gates, which gives an air of antiquity and grace to the gates of York to an extent which is wanting in Chester, but the walls of York are not complete. The walls of Conway are complete, but there is no road round them as in Chester. The walls of Londonderry are very nearly complete, but not quite so. Chester is the only place in the kingdom where you can take a complete circuit round the walls, and therefore it is, in a sense, a rich gem handed down to us by our forefathers. With regard to the rows they are a singular puzzle. Many theories have been broached—it is supposed they have been hollow ways intended for giving an advantage against an enemy, and that defence would be made by throwing down stones upon the enemy from the sides of the hollow way. Another idea is that they were built in this way for the purpose of witnessing processions in the streets, but that would be too flimsy a pretext to assign for their construction. At any rate, there they are. There is nothing like them in the civilised world, and you may well be proud of them. There are many arcades in different cities on the Continent. Bologna has miles of arcades, and Berne has arcades within its precincts, but for an arcade passing round the houses on the one-pair floor there is nothing like them in Europe, and it is natural you should be proud of them. I am very pleased to see also that in the restoration of the buildings of Chester—for buildings, after all, have only a certain term of existence, and have to be restored—I am very pleased to see that the old Gothic Mediæval style has been to a great extent kept up. There was a period, perhaps eighty or a hundred years ago, when all that had been forgotten, and in some of your streets where buildings in the rows had been pulled down, they were substituted by ugly brick buildings. But that time has passed away, and a better sense of what is due to the antiquity of Chester has begun to prevail. I must speak a word to the credit of your architects in Chester. They have very agreeably kept up the style of the old architecture, and in this way made Chester a city you may well be proud of. I am sure that my friend, Mr. Lockwood, in the building which he has designed, and a view of which I have got here, and which he is now about to erect, will do no discredit to the traditions of Chester. It will add one more to the buildings which are quite in character with all the traditions of the city. There are some things that one cannot forget on occasions of this kind. I cannot but feel that it is the proper and the graceful thing to do to make allusion to the excellent disposition and the feeling of cordiality which has existed for many years, and still continues to exist, between the noble house of Grosvenor and the citizens of Chester. It redounds very much to the credit, I may say, of both of them. The liberality of His Grace the Duke of Westminster has been manifested in a variety of ways. It has been handed down to him by his forefathers that a duty as well as a privilege is attached to his high station, and when you remember the liberality with which the park is thrown open, and the noble mansion is thrown open, the statues he has erected, and the noble gardens he has laid out, I say that Chester is very happy in having such a noble neighbour to assist her. I see there the Grosvenor motto—"Virtus non stemma"—that has been the motto which the noble Grosvenor family has acted upon for past ages. And the sense of it is by no means obliterated in the present generation. I can only hope that His Grace and his charming Duchess may be spared to see the fruits of their liberality and nobility of spirit in connection with the institution which we have been inaugurating to-day. I beg to congratulate him on the circumstances under which we are met. We cannot tell what changes there may be in the womb of time, political and social, con-

nected with our common country; but this I am sure of, that the time will never come when Englishmen will fail to appreciate the noble and generous deeds and the excellent character and doings of the Most Noble the Duke of Westminster.

## GLASGOW ARCHITECTURAL ASSOCIATION.

AT the last monthly meeting a paper entitled "A Sketch of the History and Characteristics of Stained Glass" was read by Mr. David Anderson, art teacher. The vice-president occupied the chair. The development of the art was traced from the earliest Egyptian vessels down to the Jacobean and Queen Anne domestic work of England. In the progress of the paper the changing architectural styles were noticed as the cause of the different methods of composition followed in window designs, the various processes of manufacture described, and a criticism of the various schools of glass-staining submitted. The paper was illustrated by full-sized drawings of some modern work, and also examples of glass, both lent by Messrs. Adam & Small, and other lithographs and prints. After a discussion, opened by Mr. Brough, a vote of thanks was passed to Mr. Anderson.

## TESSERÆ.

Raphael's Madonnas.

GUSTAVE PLANCHE.

TO every man accustomed to the study of living nature it is evident that the Madonnas of Raphael do not and could not live. The lips so refined and pure could never talk; the chastely downcast eyes could never look up; the cheeks, whose contours excite our utmost admiration, never glowed with such blood as runs in our veins. That this is true is the chief reason that Raphael was the greatest of religious painters; if life be impossible for the beings whom he created, it is not because he has stupidly omitted one or many of its elements, but because he has simplified, through his own powerful will, the forms in which life makes itself known to us. In order to bring the human face within the true harmony of lines of which he dreamed, he eliminated those petty details which nature presents us, with which actual life cannot dispense, but which nevertheless are not absolutely necessary in a picture. He subdues that lively colour which indicates rude force and health; he softens those muscular masses which explain and produce movement; he effaces the folds of the eyelids: and all this perpetual simplification of the lines of the human figure, far from being an evidence of ignorance or want of skill on the part of the artist, serves to signify that he has conceived and is realising a form more pure and elevated than that of ordinary humanity. His knowledge enables him to abbreviate; his wish for generalisation causes him to simplify.

Italian Campaniles.

W. S. OKELY, M.A.

In Italy a church has generally only a single campanile. It is extremely rare to find a group of towers such as occurs so frequently on the Rhine, or even the moderate number of two or three, of which England and France present to us so many examples. The campanile stands either placed in contact with the exterior wall of the side aisle, or at a little distance from it, or else it rises over one of the compartments of the side aisles. Whatever be its position, it is rarely made to combine and form one design, either with the façade or any other exterior member. Perhaps the only exceptions of any importance are the Duomo at Genoa; S. Andrea, Vercelli; and S. Antonio, Padua. Of the first, only one of the two towers is completed, but both stand so as to form parts of the façade in a manner similar to that seen in many churches north of the Alps. It may be considered that this independency of the campanile detracts from the grandeur of the church considered as one mass; and this must be admitted, though the church with its detached campanile forms a most picturesque object, especially when the group is completed by the addition of a baptistery. The fewness also of the towers in Italian churches compared with what we see in other countries, and in some cases the entire absence of them, takes away from that majesty which, on account of their great dimensions, so many of the Italian churches would otherwise have. Many an ordinary church, which in magnitude would rank side by side and even exceed that of an English cathedral in everything except perhaps in length, is passed by with little concern as it lies partly hidden by the lofty palaces of the narrow streets. Had these churches been built with pairs of towers attached to their façades, and lantern towers over the crossings, the distant view of an Italian town, striking as it is, would have been surpassingly grand.

Greek Marble.

E. DODWELL, F.S.A.

In the Pentelic marble are frequent veins, or strata, of green mica; large detached pieces are also found, as on Hymettos. The marble of Pentelikon and Hymettos rests on a stratum of micaceous schist of unknown thickness, which seems to run throughout the whole of Attica, and to form the base of all its mountains. Many quarries of white marble were known to the ancients in Greece. Most of the remains of Thorikos and the temple of Sunium are built with marble found on Laurion, near Thorikos; it is of a fine close-grained quality, containing only a small portion of mica. Rhamnos in Attica, Demetrias in Thessaly, and the islands of Naxos, Tenos, and Thasos contain ancient quarries, but the most celebrated are those of Paros. Modern writers are in the habit of adopting with too implicit confidence the opinions of the ancients, who have also placed too much reliance upon those of their predecessors, an instance of which may be seen in Pliny, who pretends that the Parian marble was called *lychnites* because, being subterranean, it was cut by the light of lamps: "*Quem lapidem Parium cœpere Lychniten appellare, quoniam ad lucernas in cuniculis cæderetur, ut auctor est Varro.*" The Parian quarries, however, are not subterranean, but cut down the side of a mountain open to the glare of day. The word "*lychnites*" was applicable to the marble on account of its large and sparkling crystals and semi-transparent quality; and for a similar reason the transparent Cappadocian stone was named *phengites* from *φῆγγος*, as *lychnites* from *λύχνος*, as it is called by Athenæus. The coarse-grained Parian marble has generally been mistaken for the Pentelic; and the latter from its fine and even quality has been attributed to Paros by those who have not visited the Grecian quarries.

Copying Mouldings.

PROFESSOR PALEY.

The best and simplest way of all is by inserting the paper in a loose joint, or by applying a large sheet of paper where a stone has been removed and left the edges sufficiently clear and sharp to trace their outlines by pressure against them, or by a pencil. These methods, however, are but seldom available, except in ruined buildings, and here care should be taken not to damage or destroy any portion of the little that is left. But many fragments of monials, groin ribs, voussoirs, and other moulded stones may be found in every old abbey, and these may readily be placed upon sheets of paper for the purpose of tracing their outlines. By these means alone a large collection of very valuable specimens may be made.

Arabesque and Grotesque.

W. DYCE, R.A.

The power of imitating objects artistically is not adequate to the ends which the ornamentist contemplates. Representations of natural objects, such as flowers or animals, are not ornaments in any other sense than works of painting or sculpture may be said to be so. The application of such representations to walls or articles of furniture, it is true, has often been made, and is daily made, for ornamental purposes, and constitutes a species of ornamental art; but it is only one among a thousand others in which artistic imitation is inadmissible. The artist and the ornamentist may choose out of caprice, as in the case of arabesques, to unite their two arts; but the arts are not essentially the less distinct, nor, as a general rule, are less incompatible in practice. The very name grotesque, applied to that kind of art by the painters of the Middle Ages because the ancient specimens of it were mostly discovered in grottos or ruins, is used by us to express anything very absurd or ridiculous; and, in truth, since it is a matter of fact that arabesques in painting or sculpture have always been the offspring of artists, they ought rather to be looked upon as a kind of beautiful nonsense than as a species of art to be reasoned about.

Blenheim Palace.

A. ASHPITEL.

The palace had been originally voted by Parliament, but with a meanness and ingratitude that is scarcely credible, they would not provide the money to pay for what they had formerly voted. Whatever faults Marlborough might have had he had saved his country—nay, Europe—from the ambition of the French monarch, by a series of the most brilliant victories. If he had not deserved the gift it should not have been voted, but having by a formal Act decreed it should be given, it was a mean mockery to withhold the money to pay for it. The queen, however, with a generous spirit, provided the funds from her own private purse during her life. At her death, the duke, though always protesting, occasionally continued to pay the workmen, believing ultimately that he should be reimbursed by the Treasury. It was before the age of "cutting" con-

tractors and "run-up" work. The custom then was for the architect to employ such workmen as he thought fitted for the job, to pay them himself, and to call on his employer from time to time for money as it was wanted. It may be thought the Parliament had been guilty of a consummate meanness in refusing supplies to carry out its own vote; but this meanness was outdone by the duke, or rather the duchess, who ruled him and every one else with a brazen sceptre. The worthy pair actually refused to pay the workmen, who, of course, were obliged to look to Vanbrugh, from whom they had received their orders. That both the duke and duchess were stained with avarice to the core, and that the latter was a fury in temper and a savage in resentment, is well known; but that they should have the gross injustice to expect their architect to pay their debts, and make them a present not only of his services, but of the house they were to live in, is absolutely inconceivable. It seems that Vanbrugh had actually advanced 2,000*l.* (a large sum in those days, especially for an author, to advance) on account of Blenheim at the time they thought proper to quarrel with him. In the meantime the duke died, leaving the duchess not only an immense fortune, but a special sum of 10,000*l.* per annum to finish Blenheim. This the duchess did, being wise enough carefully to follow out Vanbrugh's plans, though she not only excluded him from any direction of the works, but absolutely prohibited his being admitted to see the building, although accompanied by his fast friends the noble Howards. It is very satisfactory, however, to find he at last got his money, "in spite," as he says, "of the hussy's teeth."

#### Fresco-Painting.

SIR DAVID WILKIE, R.A.

It has frequently occurred to me that the restoration and introduction of fresco-painting into England would yet give a chance for the cultivation of the higher styles of art. We that possess so much, and think we know so much, know nothing of fresco; know nothing of that, the only mode known to the ancients, with which modern art grew from its revival to its greatest perfection, and with which the finest works are found identified, and must ultimately perish. Its qualities are essentially different from oil-painting. It is more abstract, less deceptive, can be seen further, in any light and in less light; though equally ornamental, it has not the palliatives of oil; though advantageous for the display of beauty, grandeur, and style, it cannot, like oil, give interest by softening or concealment to the mean form or to the low subject. An oil picture is a piece of furniture to be changed or removed at pleasure, while the fresco is a part of the fabric itself, combining sculpture and architecture, historic truth and poetic fiction, in one wide range to illustrate the purpose of the building, which, be it the gorgeous palace or the solemn temple, derives from fresco a most impressive splendour and dignity.

#### Measuring Timber.

R. MURRAY.

In measuring standing timber, the length is taken as high as the tree will measure 24 inches in circumference, less than which measurement is not considered as timber. At half this height the measurement for the mean girth of the timber in the stem of the tree is taken; one-fourth of this girth is assumed to be the side of the equivalent square area. The buyer has, in general, the option of choosing any spot between the butt-end and the half height of the stem as the girding place. All branches, as far as they measure 24 inches in girth, are measured in with the tree as timber. An allowance, which varies according to circumstances, is generally deducted for the bark. In oak it is from about one-tenth to one-twelfth of the circumference at the girding place; in other sorts of timber it is less. In all, however, this allowance depends much upon special agreement. It is usual to speak of timber by the load, which means 50 cubic feet of squared timber, or 40 cubic feet of rough timber. A load of plank is dependent upon its thickness. Thus, it will require 200 square feet of 3-inch plank to make the load of 50 cubic feet; therefore, the load of plank is the number of square feet of its respective thickness, which is necessary to make the load of 50 cubic feet. Deals are measured, according to their thickness and lengths, by the hundred, reckoning 120 to the hundred.

#### Drying of Wood.

J. JUSTEN.

Wood is a porous body, and contains in its natural state, whether dead or alive, a certain amount of moisture. By the loss of that moisture, or with the increase of the same, the bulk of the wood either contracts or extends. If we have a piece of wood where the action takes place only upon one side, it is obvious that the piece will alter its form or shape. The consequence of the loss of moisture is also the warping and the splitting of the wood. The inner structure of a stem is irregular;

for instance, we find the inner moisture of a yearly ring to be more than on its outer side. This causes the splits on the exterior after the wood is dry, and it also accounts for the impossibility to form out of the green wood a regular body which could not lose its weight or shape. The time during which the evaporation of the moisture takes place depends upon the state of the atmosphere. Several authors are of the opinion that the contraction is regulated by the specific weight. This, as a rule, cannot be adopted; for instance, lilac and oak, both being heavy and hard, contract quickly, whilst the South American maple, which is equally hard, contracts slowly. It is evident, however, that the fuller of sap a tree is, the greater will be the contraction. This will account for the fact that we find on cut timber the cracks extend from the exterior towards the centre, because the sapwood will contract more than the heart of the wood. Planks turn with their sides upwards; that is, the edges rise from the level of the centre line. This explains why we turn the inside of a plank towards the joists whilst we lay a floor, which prevents the twisting. The contraction and action of the wood cannot be checked altogether. Among the means to prevent it stands foremost the one of putting the tree into water; but when taken out it must not be stored in a place where it dries too soon, as it still would burst if done; nor must it be left too long in the water, as this will injure the quality of the wood.

#### Scagliola.

PROFESSOR ANSTED.

A highly-ornamental material, consisting of a coating of plaster mixed with alum and colour into a paste, and afterwards beaten on a prepared surface with fragments of marble, &c., has often been known under the name of scagliola, and is greatly used as an excellent and economical means of imitating the finer kinds of marble, the material being as hard as marble, very durable, cold to the touch, and taking a perfect polish. The name scagliola is derived from Italy, where the process is said to have been invented more than two centuries ago, but is now very extensively used for decorative purposes in England. The cement is prepared from the finest gypsum, broken up before calcining, and afterwards reduced to a fine powder, and passed through a sieve. It is then mixed with aluminous matter and isinglass, also with colouring matter, and it is afterwards made up with alum; and as it is generally made use of only where the more beautiful and veined marbles are to be imitated, as many different colours and shades of colour must be mixed up separately as there are in the kind of marble to be represented. Thus prepared, it is ready to be laid on to the surface intended to receive it, which has a rough coating of lime and hair already prepared. The different colours having to be laid on and mixed by the hand, the work somewhat resembles that of the fresco-painter, everything depending on the skill of the operator in imitating the style, beauty, and veining of the original. When the cement is laid on and has hardened, the surface is prepared for polishing by rubbing it with pumice-stone, and cleansing it with a wet sponge. It is then polished by rubbing, first with tripoli and oil, and lastly with oil alone. A durable lustre is thus obtained equal to that of marble.

#### Mathematics and Practical Construction.

PROFESSOR RANKINE.

In theoretical science the question is, *What are we to think?* and when a doubtful point arises, for the solution of which either experimental data are wanting, or mathematical methods are not sufficiently advanced, it is the duty of philosophic minds not to dispute about the probability of conflicting suppositions, but to labour for the advancement of experimental inquiry and of mathematics, and await patiently the time when they shall be adequate to solve the question. But in practical science the question is, *What are we to do?*—a question which involves the necessity for the immediate adoption of some rule of working. In doubtful cases, we cannot allow our machines and our works of improvement to wait for the advancement of science, and if existing data are insufficient to give an exact solution of the question, that approximate solution must be acted upon which the best data attainable show to be the most probable. A prompt and sound judgment in cases of this kind is one of the characteristics of a practical man, in the right sense of the term.

Messrs. Le Grand & Sutcliff, of Magdala Works, Bunhill Row, London, E.C., have received instructions to supply Norton's patent registering turnstiles and exit-cage turnstiles to the Cleethorpes Public Gardens, and also Cleethorpes Pier, Great Grimsby, Lincolnshire. These are the same pattern turnstiles as were used for recording the seven million entrances to the Fisheries and Health Exhibitions, and which are also to be used at the forthcoming Inventions Exhibition.

## NOTES AND COMMENTS.

ONE of the most interesting parts of the Health Exhibition at South Kensington was the room containing the models of the Roman baths at Bath, with photographs, engravings, and examples of materials which had been brought together and arranged by Major DAVIS, F.S.A. The collection was valuable on archæological and sanitary grounds, and was deserving of the two diplomas of honour which were awarded to it. The cost of the work it is now found has been 1,378*l.* 9*s.* 3*d.*, which was made up of the following sums:—Modellers' wages and materials for and completing models, 450*l.* 15*s.* 1*d.*; fixing models at Exhibition, banner, railings, and other purchases in London throughout, 377*l.* 17*s.* 2*d.*; printing pamphlets, books, photographs, &c., 153*l.* 14*s.* 11*d.*; Major DAVIS's remuneration, travelling and hotel expenses, 120*l.*; carriage of models, 35*l.* 16*s.* 2*d.*; attendant's wages, 108*l.* 12*s.* 5*d.*; travelling expenses, 36*l.* 5*s.* 11*d.*; miscellaneous expenses, 36*l.* 13*s.* 4*d.*; closing expenses, 58*l.* 14*s.* 3*d.* When the advantage that has been gained by Bath in having the merits of its waters made known to so large a number of people is considered, the expenditure on the exhibit as an advertisement was a good stroke of policy. The models are now in the New Orleans Exhibition, where, in spite of the general failure, they are not likely to prove unattractive.

A COMMITTEE of the Birmingham School Board have been making inquiries throughout the country in order to ascertain, before any more buildings are undertaken, what kind of school is considered to be the best by members of other Boards and by head-teachers. After analysing the information thus obtained the following conclusions have been drawn:—1. That, as a general rule, a school should accommodate about 1,000 children. 2. That a school should be on the class-room system, with a central hall. 3. That on sites of not less than 4,000 square yards a one-storey building is to be preferred. 4. That not less than four exits should be provided from the school into the playground. 5. That one pair of class-rooms in each department should have a movable screen between them. 6. That not fewer than eleven class-rooms should be provided for children above seven years of age. 7. That the class-rooms should be designed for an average attendance of sixty. 8. That the exits from the class-rooms should be, as far as possible, into corridors between the class-rooms rather than into the central hall, and that these corridors should be used as largely as possible for cloak-room purposes. The existing Board Schools in Birmingham have been designed by Messrs. MARTIN & CHAMBERLAIN, and are said to be superior to many of those elsewhere. The new schools, which will embody the suggestions of the committee, are expected to cost from 20*s.* to 40*s.* per head over the cost of those schools.

MM. GOOSSENS & DUBAUX, of Schaerbeek, seem to find few rivals among the Belgian contractors. Tenders were lately sought for works connected with the canal between Charleroi and Brussels, including the construction of branches, and only one was received. It was from the above-named firm, and amounted to about two millions of francs. When the state of work in England is considered, it is surprising that none of the English contractors endeavour to secure Continental works.

FROM the description which was given by Principal JAMIESON at the Glasgow Philosophical Society, it is evident that the Americans have been more successful in transporting Egyptian obelisks than any other people, and at a very much less cost. When the French obtained a grant of the obelisk that is in the Place de la Concorde there were 800 Arabs employed, and so many engineers were sent over and spent so long a time there, that all the dancing-girls in Luxor were said to know French. The cost was about 560,000 frs. The Needle on the Thames Embankment in one way or another must have involved an equal outlay. The American obelisk is 69 feet long, 8 feet wide at base, and weighs about 200 tons. Lieutenant-Commander GORRINGE, who had charge of the operations, had the block first covered with strong planking, and clasped at the calcu-

lated centre of gravity with strong steel trunnions supported on steel frames, which rested on a concrete foundation. Having been pulled over, it was supported at each end by a tier of planking, and then lowered by means of hydraulic jacks into a caisson or barge. It was afterwards towed to the steamer *Dessoug* in the graving dock, and put on board through a hole cut in the vessel's bows by a carpenter specially taken from Glasgow for the purpose. The vessel then conveyed the obelisk to New York, where it was erected in Central Park. By adopting so simple a way, the removal from Alexandria to New York did not cost more than one-fifth the sum that was paid for bringing a similar monolith to London.

THE demolition of a chimney-shaft of about 130 feet in height was lately accomplished in the following inexpensive way at Carouge, a village near Geneva. The courses on one side near the base were removed and timber shores were placed to support the mass, so that no danger could arise to the workmen. A fire was then lighted, and in a short time the timber was weakened, and as the pressure increased the whole of the chimney toppled over. The experiment was without precedent in Switzerland, and was observed with interest by the builders of Geneva.

THE council of the Derbyshire Archæological Society have adopted the plan of publishing abstracts of some of the more interesting and original records relating to the county, which are found in that great national storehouse of history, the Public Record Office. The value of such absolutely authentic information to the future parochial or general historian of the county, and its general interest to all readers interested in the past life of Derbyshire, cannot be exaggerated. This year the early "fines," or final agreements, are begun. Probably more space will be given in future numbers of the "Transactions" to this feature. The example might well be imitated in other societies, for one of the difficulties of an archæologist is the discovery of local information amidst the vast mass of national records. It is expected that the Royal Archæological Institute will commence its congress in Derby either the last Tuesday in July or the first Tuesday in August next. The congress lasts eight days, and expeditions and meetings of exceptional interest will be arranged. Steps are already taken to form working committees, and a temporary museum will be formed.

A SMALL but excellent handbook or pamphlet on "Perspective" has been prepared by Mr. E. F. C. CLARKE, architect, for Messrs. ROBERTSON & Co. It is well adapted for painters' use, who often lose time in endeavouring to fix the relative sizes of objects in pictures. The handbook is not a geometrical treatise, but a short and ready series of suggestions for men who are able to draw and paint, but have not made a special study of the science.

A PARAGRAPH has been reprinted in some of the English papers on the subject of experiments which have been made in America upon the deterioration of iron under varying loads. But from the way in which it has been worded, it would seem as if there was a revelation of flaws which hitherto had been concealed. All that the experiments appear to prove is that there is a greater strain on a girder under a variable load, as in a railway bridge, than when it sustains a constant load, as in a wall. The following conclusions by WÖHLER and SPANGENBURG appear to express what is known on the subject:—1. Rupture may be caused by repeated applications of a unit-stress less than the ultimate strength of the material. 2. The greater the range of stress the less is the unit-stress required to produce rupture after an enormous number of repetitions. 3. When the unit-stress ranges from zero up to the elastic limit the number of repetitions required to produce rupture is enormous. 4. A range of stress from tension into compression, or *vice versa*, produces rupture sooner than the same range in stress of one kind only. 5. When the range of stress in tension is equal to that in compression, the unit-stress which produces rupture after an enormous number of repetitions is a little greater than one-half of the elastic limit.

PROPOSED VILLAS, PATTY MOON'S WALK, TUNBRIDGE WELLS.  
BRETT A. ELPHICKE, ARCHITECT.

CONGREGATIONAL SUNDAY SCHOOLS, DELPH.  
ALEXANDER BANKS, ARCHITECT.

## ILLUSTRATIONS.

I. HEBREWS. II. A ROUMANIAN LADY.

WE have already published two illustrations from pictures by Mr. BRIDGMAN, the American artist, who now lives in Paris, which were striking from their Eastern character and the treatment of light and shade. In the plates which are now given Mr. BRIDGMAN has not gone quite so far eastwards, but, like the others, they are suggestive of his fondness for subjects which are remote from Western civilisation. In pictures like that of *Royal Sport*, where an Assyrian monarch is shown killing a lion, or the *Funeral Procession of a Mummy*, we have a combination of archæology with art; while in other works, like those illustrated, we see the painter's powers in imparting picturesqueness to every-day life.

TOYNBEE HALL, WHITECHAPEL.

THE building, of which some interior sketches are given in this number, has been built in Commercial Street, Whitechapel, for the residence of twenty graduates of the Universities of Oxford and Cambridge. Although recently opened, it is fully tenanted. The buildings have been executed in red brick and Box stone by Messrs. LATHEY, from designs by Mr. E. HOOLE, F.R.I.B.A., of 104 Great Russell Street, W.C. An account of the University settlement in Whitechapel may be found in the January number of *Time*.

PROPOSED VILLAS AT TUNBRIDGE WELLS.

THE illustration shows the view of a pair of villas in course of erection for Mr. ALFRED DIGGINS, and are situated in Patty Moon's Walk. The treatment of elevations is local red bricks and tiles, relieved by rough-cast, the cost for the pair being about 1,100*l*. Mr. J. JARVIS, of Tunbridge Wells, is the contractor.

CONGREGATIONAL SUNDAY-SCHOOL, DELPH.

THIS building has recently been erected at Delph, Yorkshire, from plans prepared by Mr. A. BANKS, architect, Oldham, who has also superintended the work. The style of architecture adopted throughout the building is a free treatment of Gothic. The flatness of the front is relieved by a projecting bay, which contains the inscription and memorial-stones, placed above the entrance-door. The large school, which is 52 feet by 29 feet, and contains a platform at one end, has an open-timbered roof of a simple design. Adjoining the front vestibule are the ground-floor class-rooms, measuring 14 feet by 10 feet, containing cupboards placed under the window bottoms, and used for the storage of books. The staircase, which is of stone, and is in close proximity to the front entrance, leads to the first-floor class-rooms, which are similar to those on the ground floor, though much more lofty. At one side of the large school is the infants' room, measuring 30 feet by 14 feet, and is only one storey high. The building is faced externally with the best Lightcliffe parpoints, relieved with sandstone dressings, the roofs being slated with Welsh slates, capped with red ridge tile. The various rooms on the ground floor are laid with patent wood-block paving, which is noiseless, and impervious to damp and dry rot, which is so prevalent in the locality. The upper portion of the windows are glazed with lead lights, and the lower portions with sheet glass. Great attention has been paid to ventilating the building, TOBIN's inlets having been used in all the rooms for the admission of fresh air, BOYLE's air-pump ventilator having been used for the extraction of the vitiated air. The building is heated on the low-pressure system, the pipes being fixed in all the rooms. The chief contractor is Mr. C. WINTERBOTTOM, Delph.

CHURCH OF ST. NICHOLAS, BLOIS.

THIS illustration is taken from a drawing by Mr. E. W. JENNINGS, of Swansea, some of whose sketches of French buildings have already appeared in this journal.

The Art Exhibition at Wolverhampton, which was lately closed, contained 129 pictures and 150 water-colours. The great masters were represented by 107 examples, and British artists by about 300 pictures. Of the whole collection 500 were contributed by noblemen and gentlemen in the town and neighbourhood. The pictures and other works of art in the gallery were insured in the gross for 91,000*l*.

## THE BOYLES: FATHER AND SON.\*

WHETHER modern buildings are better or worse than those erected by our forefathers is a question on which people profess to differ, but there is no doubt that a greater variety of men, and of men who are more widely separated, are concerned in modern construction. In old days a building was generally a product of the district in which it was erected, if not of the nearest village. It was probably built of local wood and local bricks or stones, and the local craftsmen were able to do all the work, whatever might be the material. There was so little brought from a distance that building was hardly considered to have reached the dignity of other trades in the eyes of economists. When a writer wished to show what commerce or production meant he referred to the breakfast-table or to dress, and explained how the coffee came from one part of the world and the sugar from another, and speculated on the difference between the men who produced the silks and the muslins of the lady who presided at the table. It would have seemed an impossibility to draw illustrations from the house or the merchant's shop. Nowadays the case is altered. It is only necessary to glance over the advertisement pages of a journal such as ours to perceive the number of traders and manufacturers who co-operate in the building of the cheapest house. Distance is no longer reckoned, and it is found more economical (to say nothing of other reasons) to bring articles some hundreds of miles than to have them made on the spot. The humblest builder in a remote village is in correspondence with wholesale houses in Birmingham, Glasgow, or London, and it would seem as if, in course of time, the office of the local workman will be simply to arrange in their proper positions the things which have been manufactured in another part of the country. There is not a modern Board school which could not be made to afford a lesson in the geography of England by simply explaining the positions of the places from whence its constituents were derived.

Another cause has helped to make the local man no longer all-sufficient. Every building of size comprises many inventions among its parts—ventilators, grates, locks, hinges, bells, lights, drains, &c., which are patented productions, besides things which are equally the work of specialists. There is consequently a host of able men all over the country of whom every architect can become the commander, and who are ready to serve him with loyalty and zeal. The village workman is as little able to compete with them as the village gossip with the modern newspaper. The conditions of building in our days are consequently more complicated than formerly, for there is a greater development of the principle of a division of labour; but, from the extent and perfection of the organisation, there is a risk of overlooking the debt which is due to the men by whom it has been created.

Among those men an honoured place should be given to the founder and the present representative of the firm of Robert Boyle & Son. It may be said of them that they have made ventilation a certainty, for it can with almost as much safety be assumed that one of their appliances will produce a calculable result, as a pipe will allow of a quantity of water to pass through it that will be proportionate to its diameter. This certainty has brought the science within the sphere of commerce, and it has become as easy to order a ventilator to suit a building as a lock or a boiler. Trade, like virtue, is supposed to be its own reward, but inventors and manufacturers are men, and must desire to have their share of that renown which they see obtained for services that are less useful than theirs. We are glad to see that a biographical sketch of Robert Boyle has at last been published, and from the interest of the subject it is to be regretted that the book has not been made of a larger size. What we have, however, is thoughtfully written, and will well repay perusal.

On the title-page Robert Boyle is described as "Inventor and Philanthropist," and it can be affirmed without exaggeration that his inventiveness was owing to his benevolence. He was a man whose intellect appeared to have drawn inspiration from his heart, and he could pass without much change of manner from his laboratory to a mission of charity in one of the wynds of Glasgow. There was no trace of selfishness in his actions, and in his inventions he was thinking more of the public good than of his own rewards. It followed that in many cases the inventor did not reap all the benefit to which he was entitled.

Robert Boyle was born in Hamilton in 1821, and he died in 1878. His last words were, "I will think no more," and his brain had earned rest by forty years of unceasing exertion, mainly in Glasgow. A well-read student of a religious turn will always find men in that city who can provide him with opportunities of doing good, and Robert Boyle soon after his arrival was recognised as a valuable addition to the civilising forces of Glasgow. He was endowed with many of the qualities

\* *Robert Boyle: Inventor and Philanthropist.* A Biographical Sketch by Lawrence Saunders. London: Gilbert Wood & Co.

of an orator, and there was a frankness about him which prepossessed an audience as soon as he began to speak. A student himself, he was eager to impart knowledge to all, and for many a year he laboured hard as a lecturer. He was not one of those smatterers who take up a science on one day in order to expound it on the next, and who, without much preparation, astonish themselves equally with their audience by their erudition. Robert Boyle was a *savant*, and had the making of a professor in him, although it was never his destiny to teach within a college. In this way there is a resemblance between him and James Watt, who, although gifted with pre-eminent powers of exposition, and a genius for science, was fated to dwell near the gate of Glasgow College, and to mend philosophical instruments for men who were less able than himself.

It is always difficult to trace the origin of inventions. An idea may enter the mind apparently by accident, and yet somehow it grows there, gives rise to others, which, in their turn, become fruitful, and then in time some leading thought is evolved, and the others fall into due relations around it. We can imagine a benevolent man becoming pained by the stuffiness of the rooms in the wynds of Glasgow, and making speeches and writing letters to the newspapers about the misery of the inhabitants. But when the pain arises in the mind of a philosophical experimentalist, it is likely to produce a different kind of result. We may therefore conclude that the origin of that air-pump ventilator which is now in use in a great part of the world, on sea as well as on land, is to be traced to a good man's desire to alleviate the condition of the mass of the population. Unhappily that desire has not been fully realised, owing partly to apathy and partly to the power of the *laissez-faire* principle. And yet there seems nothing unreasonable, since rebuilding the houses of the poor is impracticable, in believing that it would be possible, by a simple appliance, to remove vitiated air quickly from the humblest class of rooms. Reformers discuss colossal projects of improvements which need vast sums to carry them out, and meanwhile great suffering is endured, but to the mind of a self-reliant man like Robert Boyle it will be always plain how much can be done, and at a small expense, by zealous exertion on the part of individuals. In the days when there were only imperfect ventilators it was calculated that by introducing them in the cavalry stables the War Office saved 10,000*l.* a year, as fewer horses were lost; it is then safe to assume that much disease and suffering would be prevented, lives spared, and the productive labour of the country increased if the use of ventilators was rendered compulsory in the houses where the poor live.

Of all Mr. Boyle's inventions, the ventilator is the one which is best known, and from the improvements which have been effected in it by his son it has become paramount among appliances of its class. Our readers are familiar with its strength, simplicity, cheapness, effectiveness, and, since air must move, the automatic character of the apparatus becomes inevitable and continuous. The air-pump ventilator illustrates a great law of nature, and therefore is never likely to be superseded. The power which operates in producing the currents being as constant as gravity, there is no need of that perpetual examination which is so often required in what is called mechanical ventilation; there is no noise, no parts which can become disarranged, and none of those stoppages and other contingencies which are not unknown to people who are indiscriminate in their adoption of apparatus. The introduction of an air inlet tube, and which is connected with a Bunsen burner, allows the temperature of the air to be raised to any degree that is desirable, and in this way the objections to ventilators which are entertained by nervous people, servants, and the like can be removed. Another arrangement no less useful allows of the direct removal of those products of combustion which are among the inconveniences attending gaslights. The success of the various appliances having been demonstrated beyond all controversy, it is not surprising to find it stated in the book before us that Mr. Boyle's services as a consulting engineer are sought "by the first architects and engineers in Europe and America. In the latter country his suggestions have been adopted for some of the most important public buildings, handsome fees being paid for his practical advice." The history of the firm for the past fifteen years would throw a light on the growth of public recognition of the advantage of ventilation; but how much of this is to be attributed to the stout fight made by Messrs. Boyle, father and son, will be suggested from the following passage:—

If we consider the state of apathy which existed with regard to the all-important question of ventilation and sanitation when Robert Boyle and his son first began to move in the matter fifteen years ago, some idea may be formed of their perseverance and industry in raising the subject to the prominent position it now occupies. To their indefatigable exertions and unconquerable determination to continue the good fight against ignorant prejudice and chilling apathy, we are indebted for a great progress which, at the risk of being monotonously eulogistic, it is the object of these pages to encourage

and promote. They drew attention to the question in its relation to the health of the masses, and to their efforts may be attributed, to a very considerable extent, the present position of sanitary science. The difficulties which had to be encountered by these pioneers during the first stages of their crusade against the foul-air demon, and the disheartening indifference and postponements with which all their efforts were received, even by those who should have been their warmest allies, would have crushed the spirits of less resolute men. But these brave and tried champions of health, supported with the knowledge that they were fighting in a good cause—a cause which, in spite of all reverses, must ultimately triumph—were not to be daunted or turned aside from their purpose.

The leading principle which actuated the life of the late Mr. Robert Boyle, namely, the welfare of his fellow-men, has been faithfully adhered to by his son, whose principal aim in developing the great business of which he is now the head has not been so much to amass wealth, as to practically inculcate the lessons of sanitary reform. By laying a sure foundation for future generations to profit by, he has laboured in the hope that it may yet be within the range of the possible to practically realise Dr. Richardson's "City of Health," and banish for ever the dread fevers and diseases which at present scourge the earth. If the acquisition of money had been Mr. Boyle's or his father's object in life, they had opportunities presented them of finding it more easily in other spheres of work; but being men of modest desires, and having no craving after mere worldly aggrandisement or display, they preferred to keep to the path they had chosen. They have expended in the cause of sanitary science and in the practical development of new sanitary inventions enormous sums of money—not less, we are informed, than one hundred thousand pounds—during the past fifteen years.

Considering the difficulties which beset the efforts of such a man as Mr. Robert Boyle to make ventilation readily available, it is unbecoming in a party of amateurs, who arrogated to themselves the office of an arbiter, to make little of ventilating appliances. But he has not been daunted by the efforts of the lovers of primitive happy-go-lucky slits and slashes, and other devices which are more suggestive of humour than of science. One of his latest endeavours has been to produce an appliance which, from its low price, might be capable of tempting the most penurious owner of tenement property in large towns. On this part of Mr. Boyle's career Mr. Saunders writes as follows:—

The notorious "Kew experiments" are a striking example of the pernicious effects of tests being made by unqualified persons, the results of these experiments having the effect of bringing sanitary science into ridicule, and doing the cause an incalculable amount of injury. The *Times*, in a withering criticism of these tests, says:—"The method of testing was incorrect, and therefore the tests are valueless. . . . Neither in the case of either of the cows nor the tubes was their true value as extractors ascertained." Mr. Boyle has had special reasons to study methods of ventilation at small cost, because he has always been deeply interested in providing healthier homes for the crowded poor. He fully realised the very important fact that they needed pure air more than their better-fed and better-clothed brethren. The importance and urgency of the matter was forcibly brought under his notice by Mr. Edwin Chadwick, C.B., a sanitarian justly styled by Dr. Richardson "the father of sanitary reform;" and Mr. Boyle resolved to work out a scheme of ventilation which would meet the requirements of the poorer class of dwellings. The result was the introduction of an economic system of ventilation for workmen's houses, by which a small dwelling consisting of four apartments can be most efficiently ventilated without draught at a cost of four guineas. The secret of the low price of this system is not difficult to discover, as it is provided by Mr. Boyle at cost price, *solely for the use of the working classes*.

This passage is remarkable as showing a return to the original use of the ventilators as a remedy for the defects of Glasgow wynds, and suggests a completion of the circle. It also explains the universal applicability of the ventilator, for when it is found in palaces, poor-houses, theatres, churches, court-houses, colleges, hospitals, prisons, lodging-houses, as well as in residences of all kinds; in men-of-war, yachts, and floating hospitals, there is a stronger testimony in its favour than words can afford. It is satisfactory to learn that Mr. Boyle's exertions for the public health have brought a deserved reward, and the following sketch of the practical sanitarian "At Home" will be read with interest by his numerous friends all over the world:—

Before closing these pages it may be of some interest to the many people, in various parts of the globe, who know the famous ventilating engineer by name only, to learn something of the surroundings and daily life of the present Robert Boyle. He inherited from his father not only the exceptional faculty of adapting means to an end, but also that innate delicacy of perception and sympathetic appreciation of form and colour which constitute a refined and elevated taste for art. This passion for the truly beautiful has induced him to decorate even his offices in a purity of style rarely met with in business circles. His private room at the Glasgow office is unique as an example of decorative taste, and its charm is enhanced by the costly pictures, examples of the old masters—Rubens, Titian, Correggio, Bellini, Paul Veronese, Rembrandt, and many others—which cover the walls. The lesson is a good one, for there is no reason why business men should move in gloomy and unhealthy offices. The mind achieves more under the

influence of higher inspirations, and a cheerful spirit is maintained by the presence of the beautiful. Mr. Boyle's home affords everywhere the same striking evidence of a singularly cultivated taste. His *bijou* residence, "Ranfurly," situated in the "Garden of England"—Kent—is a model of refinement in artistic decoration and arrangement. The furniture of the public rooms was designed by himself, and the carpets were specially woven to match the rare specimens of tapestry hangings and Oriental fabrics. Everywhere selected works of art of unusual merit—pictures, sculpture, and rare china—are arranged with admirable knowledge of the poetry of light and shade and colour, and in the midst of them spring graceful palms and rare exotics, blending their emerald leaves with the rich hues of subdued light falling through the stained-glass windows. We mention Mr. Robert Boyle's faith in the beautiful because art in its purest and most truthful aspect has undoubtedly an influence for good in many ways allied to sanitary progress. A healthy mind is necessary to physical vigour, and it is the conscientious practice of the doctrines he preaches which elevates Mr. Robert Boyle to the rank of a true reformer. Not only in his daily surroundings, but also in his occupations, he endeavours to prove by example the lessons by which health may be maintained and enjoyed. Few men get through a larger amount of really useful work. Conducting correspondence on sanitary matters with engineers and architects in almost every part of the civilised world, and managing with great administrative ability his now colossal business, he nevertheless finds time for recreation; and, although he has not imitated the Prime Minister by selecting timber felling for the renovation of brain and muscle, he contrives in the intervals of work to take in copious draughts of fresh energy by change of scene and air. Skimming over the sea under the broad white canvas of his yacht, tramping through the stubble with his gun, or leaping ditch and fence on his well-trained hunter, he restores the vital forces of nerve and tissue. Manly exercises and recreations are necessary to successful work, and it is fitting that a prolific inventor of sanitary appliances and a devoted champion of Hygeia should demonstrate in his daily life the important lessons necessary to robust health in these days of high pressure.

Since Mr. Robert Boyle made London his headquarters his business has developed to an extent which clearly indicates the real progress made in popularising sanitary appliances. The offices in Mansion House Buildings, where the London business had been carried on for nearly ten years, afforded insufficient accommodation for the rapidly-increasing connections, and the firm was consequently induced to remove to the extensive and handsome premises on Holborn Viaduct. But the requirements quickly outgrew the capacity of even that spacious establishment, and it became necessary to take in equally extensive premises adjoining. At the same time the firm established London works to relieve the increased pressure on the Glasgow manufactory, and suitable buildings were found and fitted for the purpose in the neighbourhood of Euston Road. Still the business grew apace, orders multiplied, from every part of the world the mails brought fresh commissions, the owners of mansions, churches, factories, and workshops anxiously sought the firm to rescue them from the miseries of bad ventilation, and thus the resources of the works were in time insufficient to meet the growing strain, and a more spacious factory has now been provided, the Glasgow works being also enlarged four times its former capacity.

It is satisfactory to learn that Mr. Robert Boyle has no intention of resting content with this most encouraging success, but proposes to avail himself of his professional influence and admirably organised business to extend his sphere of sanitary work. He is making arrangements to deal with the more general and complete sanitation of dwellings, and drainage of towns on improved lines. The question of regulating the temperature of air in buildings is one of great importance to health, and, at the urgent request of architects, he is now engaged in the preparation of a scheme for efficiently combining heating and ventilation in a scientific and practical form, which will insure greater economy and, by the application of heat to the proper parts of the buildings, effectually prevent the cold draughts which are experienced in most public edifices. The chilling currents which have a deadly effect on delicate people are chiefly caused by the defective methods of heating at present in use. Mr. Boyle's plan will save architects the trouble and inconvenience of calling in a separate firm to do the heating, and better results must necessarily follow from the harmony and comprehensiveness of the arrangements.

Notwithstanding the complete success of the air-pump ventilator, the innate restlessness of inventive genius has led Mr. Boyle to discover an improvement, which he has recently patented, and which is said to surpass the present ventilator both in efficiency and simplicity. The improved form of ventilator will, we understand, entirely supersede that hitherto supplied, as it is not considered desirable to submit to the public apparatus of this kind, however efficient, while better results are attainable. In the course of time it is very probable that even the new and improved form will in its turn be superseded, for Mr. Boyle refuses to sit down with self-satisfied triumph. Onward, ever onward, searching for the perfect, adding improvement to improvement, and regarding each achievement as but a stepping-stone to others, the fertile brain of a true scientist never rests. Although Dr. Richardson informs us that "since these excellent ventilators have been introduced, we have now got perfect methods of ventilation," we have reason to anticipate some startling discoveries as the results of Mr. Boyle's ceaseless experiments and strivings after perfection. No apology is necessary for these commendations. Professional success of no ordinary kind, and public work carried out with remarkable ingenuity and thoroughness, justify us in setting forth this young man as an example worthy of note. Better than all the platform platitudes of sanitary reformers is the actual work accomplished. He has worthily followed in the footsteps and carried on the unfinished labours of his distinguished father, and we regard with lively hope the prospect of a

life begun so well, and devoted with such singleness of purpose to the public weal.

In conclusion, we can with confidence advise our readers to obtain the book for themselves. It is full of interest as an account of a useful and benevolent life, and is also a very complete record of the progress of science in dealing with the difficult subject of ventilation.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### MONTAIGNE'S HOUSE.

THE French papers contain a little more information concerning the destruction recently of the château of Montaigne, the essayist, of whose works the British Museum possesses two old translations. One belonged to William Shakespeare, the other to Ben Jonson. The house is situated in the canton of Velines, near the village of Montaigne Saint-Michel, and about thirty-five miles eastward of Bordeaux. The part of the building where Montaigne was born in 1553, and which, as the home of his ancestors, he held in deep affection, no longer exists, but happily the library tower, where he studied and spent a great part of his days has been preserved from the flames. In Carlyle's "Life of John Sterling" there is mention of a pilgrimage in 1836 to the house, which, from its out-of-the-way position, is almost unknown to English travellers. Emerson also refers to the journey. "I became acquainted," he says, "with an accomplished English poet, and found that from a love of Montaigne he had made a pilgrimage to his château, still standing near Castellan, in Perigord, and after two hundred and fifty years had copied from the walls of his library the inscriptions which Montaigne had written there." The following is Sterling's account of the place, which he described as "an unpublished narrative of a visit to the spot, by a young man who was at one time supposed capable of a future improvement in practical sense and worldly respectability, such as he is far from having realised":—

The part of Montaigne's house which we first reached was the tower described by him in his essay "On the Three Commercies" (iii. 3) as containing his library and study. It is a plain, round structure at the south-eastern corner of the château; a dead wall runs from it on either side at right angles, and rises to about half its height. This is in reality the exterior of ranges of outbuildings, which form two sides of the courtyard. In this wall, close to the tower, and facing us as we approached, was a small gate, through which we found entrance. The château itself was now on our left, running along the western side of the quadrangle. It is a high building of grey stone, evidently very ancient, and probably untouched, except for repairs, since the days of Montaigne's father. There are a considerable number of windows scattered very irregularly over the front. Near the middle at either side of the small unornamented entrance are two large and high towers of unlike architecture; the one with deep machicolations, the other without them, and both with conical roofs. If erected, as I presume, by Montaigne's father, the building must be about three hundred years old; the whole place has now an air of sluttish neglect, though not at all of decay. It is now inhabited by an old gentleman, formerly a military man, whose civility we should ill repay by recording any idle accounts of his simple establishment and very agreeable conversation. The house is only one room deep, and behind it runs a long and broad terrace, covered with grass, and with some trees growing upon it—among others a large horse-chestnut. It is bordered by a stone balustrade, which rises on the edge of a steep, wooded bank, and has beyond it a very extensive prospect over a flat country, with slight eminences on the horizon, marked towards the north by the village and château of Mont Peyroux, which in Montaigne's day was a sort of dependence on his seigneurie, and belonged to his younger brother. Near it, and still higher against the sky, are the ruins of the château of Gurson, destroyed in the Revolution, and which seems to have been a castle in our English sense of the word—that is, a feudal abode constructed for defence. It was probably the residence of the lady to whom Montaigne addresses his "Essay on Education" (i. 25). The whole prospect is woody and cultivated, but without water or any very remarkable outlines, open, airy, quiet, and sufficiently prosperous. The old gentleman told us that he was possessed of eleven *métairies*, or farms, with the château, but that Montaigne had held eighteen. The property had come by marriage to the Ségur family, who had taken the name of Ségur de Montaigne. They sold the estate to the present owner, who in turn was ready to dispose of it if he could find a purchaser.

After taking leave of our host we returned to the corner

tower, which we examined throughout, and were much interested by the minute agreement of its present state with everything recorded in Montaigne's description. This, too, was evidently not a modern and factitious correspondence, but secured by the abstinence of the successive owners from any changes, however slight. The ground-floor retains the appearance of having been once a small chapel, though now dark and dilapidated. The first floor, which was the sleeping apartment of the Gascon philosopher, does not look as if it had been applied since his day to any other purpose. The third and last storey is that so particularly described by its occupant as having contained his library and study. These are his words (iii. 3) :—

When I am at home I the oftener visit my library, from which I at once survey all the operations of my family. 'Tis over the entrance into my house, from whence I have a view under me of my courtyards and garden, and of most of the offices of my house. There I turn over one book, then another, on various subjects, without order and without design. One while I ruminate, another while I copy and dictate, as I walk to and fro, such whimsies as these in my Essays. 'Tis in the third storey of a tower, of which the first is my chapel; the second a chamber and its closets, where I often lie to be retired; above it is a great wardrobe. This was formerly the most useless part of my house. I there pass away the most of the days of my life, and most of the hours in the day, but am never there at night. At the end of it there is a very neat closet, with pleasant window-lights and a fireplace. And was I not more afraid of the trouble than of the expense—the trouble which drives me from all application to business—I could easily join to it on each side, and on the same floor, a gallery of 100 paces in length and 12 in breadth; there being walls already raised, though for another design, to the height that is requisite. Every retired place should have a walk in it; for if I sit still my thoughts sleep—my fancy does not operate so well as when 'tis put in motion by that of my legs. They who study without a book are all in the same condition. The form of my study is round, and has no more straight than what is taken up by my table and chair, so that the curve presents me with a view of all my books, in five rows of shelves, quite round me. It has three noble and free prospects, and is 16 paces in the diameter. I am not so continually there in the winter, for my house is perched upon an eminence, as its name imports, and this part of it is most exposed to the wind, which pleases me the better, for not being so easy of access, and a little remote as well for the benefit of exercise as for being more retired. 'Tis there that I am in my kingdom, as we say; and there I endeavour to render myself sole monarch, and to sequester this corner from all society—conjugal, filial, and civil.

This passage would answer in most respects as a description of the spot at this hour, though he who wrote it has been dead two hundred and fifty years. The room still overlooks the entrance of the château, and from three windows, in different sides of the circuit, commands the garden, the court, the house, and the outhouses. The books, indeed, are gone; but the many small rafters of the roof are inscribed on their lower faces with mottoes and pithy sentences, which recall, as by a living voice, the favourite studies and thoughts of Montaigne. Such are these few hastily transcribed in a note-book :—"1. *Solum certum nihil esse certi, et homine nihil miserius aut superbius.* 2. 'Ἀλλοίωσιν ἄλλον θεῶν τε κἀνθρώπων μέλει. 3. Ταράσσει τοὺς ἀνθρώπους οὐ τὰ γράμματα, ἀλλὰ τὰ περὶ τῶν γραμμάτων δόγματα. 4. *Quid superbis, terra et cinis!*—Eccl. x. 5. *Vae qui sapientes estis in oculis vestris.*—Eccl. v. 6. *Favere jucunde presentibus. Cætera extra te.* 7. Παντὶ λόγῳ λόγος ἴσος ἀντίκειται. 8. *Nostra vagatur in tenebris, nec cæca potest mens cernere verum.* 9. *Fecit Deus hominem similem umbræ post solis occasum.*—Eccl. vii."

The chapel still shows the recess where stood the altar, and there are the remains of colours and gilding on the defaced coats of arms around the walls. The bedroom floor presents nothing remarkable, but that above, in which are the inscriptions on its rafters, preserves the exact form described by its ancient occupant. The paces of Montaigne must have been of about a foot and a half, for the diameter of the tower inside is about 24 feet. The circle is at one part cut by two straight walls, joining in an angle, being the portion which he speaks of as adapted for his seat and table. The three windows, affording a rich and free prospect, are still unchanged. There is a sort of closet opening off the room, with the traces of painted ornaments on the walls, a fireplace, as he mentions, at one end, and a window, which entitles it to be spoken of as *très plaisamment percé*—having a pleasant window-light, and which, though directly overlooking the courtyard, furnishes a view, above the northern line of offices, towards Mont Peyroux and Gurson.

The whole appearance and position of this apartment seem especially characteristic of Montaigne. The cheerfulness, the airiness, the quiet, the constant though somewhat remote view of natural objects, and of the far-spread and busy occupations of men—all are suitable to him. The ornamenting the joists of his chamber roof with several scores of moral sentences was the work of a speculative idler, and their purport is always, so far as I saw, suitable to his sceptical but humane and indulgent temper. The neglect of all elegance and modern convenience in the house, together with its perfect preservation from decay, add to the interest, and seem to prove that it is

maintained in its old completeness and bareness, not from any notion of use, but out of respect for the memory of its celebrated owner.

Since Sterling's visit the house changed owners two or three times. In 1850 it became the property of M. Magne, a gentleman who valued it on account of its associations with Montaigne. An enthusiastic lover of the philosopher, it was his wish to live and die in Montaigne's chamber. The old Gascon sceptic has admirers all over the world, and it is not surprising that during the two days after the fire there were two hundred messages transmitted to and from the local telegraph office, a greater number than passes through the wire in the course of a year.

## NORMAN ARCHITECTURE NEAR MANCHESTER.

A PAPER was read by Mr. Robert Langton at the last meeting of the Lancashire and Cheshire Antiquarian Society on "The Remains of Norman Architecture in the Neighbourhood of Manchester." The author said that Lancashire was not rich in Norman architecture, for several reasons, but what traces there were of such work were peculiarly interesting. He briefly described the remains to be found at Eccles, Bolton, Flixton, Middleton, Radcliffe, and Prestbury. The walls of the present parish church at Eccles were no doubt, he said, full of portions of the Norman church, and till about twenty years ago the north wall of the choir exhibited in its east window and gable a very fair example of decorative work. The church of St. Mary, Bolton, recently entirely rebuilt, was probably erected in Anglo-Saxon times, since fragments of Saxon crosses and carved stones had been found in the walls and foundations of the fifteenth-century church lately taken down. With those were found some very interesting relics of good Norman work. There was a church in Flixton in Norman times, and, although it had been partly rebuilt twice, in the fifteenth and eighteenth centuries, the old materials had been used, and traces of the original work were still to be seen. St. Leonard's Church, Middleton, was a fifteenth-century building of considerable interest. It replaced a very interesting Norman church, remains of which were still in existence. The church of St. Bartholomew, Radcliffe, was altogether a very interesting specimen of a Lancashire parish church, and was remarkable alike for its Norman and decorative features. The Rev. E. F. Letts alluded to the traces of Norman or Early English work found in the cathedral. Mr. Langton, however, demurred to the assumption that any traces of a Norman church had been discovered there. He believed there was a Saxon church in Manchester, and there might have been alterations in Norman times, but he did not think there was ever a Norman church where the cathedral now stands.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the Edinburgh Architectural Association was held on Monday. The president, Mr. G. Washington Browne, occupied the chair. After some preliminary business, the chairman called upon Professor Baldwin Brown, B.A., to read his paper entitled "Gottfried Semper and his Theory of Architecture." He described Semper as one of the most distinguished of modern German architects, and, as a writer, famous for his contributions to the history and theory of the art he practised. His career was especially interesting to natives of this country, as part of his life was passed in London, where he worked for some years in connection with the Science and Art Department. The leading events of Semper's life were briefly summarised. Born in 1803 at Hamburg, he studied first at Munich and then at Paris. Leaving the latter city after the Revolution of 1830, he travelled in Italy and Greece, where he gained that insight into the principles of ancient architecture of which he made good use later on in his classical work on "Style." In 1834 he was made director of the Academy of Architecture at Dresden, where he divided his time between teaching and the carrying out of important architectural works, such as the Dresden Theatre. Driven thence by the Revolution of 1848, Semper came to London, where he was invited by the Prince Consort to conduct classes under the newly-established Science and Art Department. After a few years he removed to Zürich, where he again had the superintendence of great buildings, and where in 1860 he published his two volumes on "Style." Semper's last practical work as an architect was in connection with the colossal buildings erected on the "Ring" at Vienna, where he finished his design for the Opera House and the new Museum. He died in Italy in 1879. Going on to speak of Semper's contributions to the literature of his art, Professor Baldwin Brown gave a short account of

Semper's book on "Style," which contained, he said, in the first place a full and admirable discussion on the industrial arts, the materials employed in them, and the style of treatment which the artist should adopt in dealing with different purposes. In the second place, there might be found in the work the materials for a history of the constructive and ornamental arts of antiquity, which should do for ancient times what Jules Labarte has done for Byzantine and Mediæval in his "Histoire des Arts Industriels," while there were dispersed through the volumes profound and suggestive remarks which might form bases for a philosophy of art. As a specimen of Semper's treatment of the industrial arts, a *résumé* was given of the first few chapters of his book, which deal with the materials of the textile arts, and the principles to be followed in the decoration of walls and floors. Semper's general theory of architecture was next referred to. Architecture as a fine art did not, in his view, begin with the shelter or fortress of primitive man, but in structures raised for purposes of religious or patriotic commemoration. Early monuments of architecture were in many cases, like the temple of Solomon, merely copies in permanent materials of festal structures formed of wooden framing and covered with rich hangings and garlands. A few words on the bearing of this theory on the history of architecture up to the time of the Romans concluded the paper, on which discussion was invited. At the conclusion of the discussion, Professor Brown was accorded a hearty vote of thanks, which was acknowledged.

### FOREIGN POTTERY.

A LECTURE was delivered on Saturday at Burslem by Mr. Woodall, M.P., on "Foreign Potters and Pottery," in which an account was given of what had come under the lecturer's notice as a member of the Royal Commission on Technical Instruction. Mr. Woodall said that for convenience he would classify the Continental potteries under three heads. First, there were the great porcelain works of Sèvres, Dresden, and Berlin, which had been founded and were sustained with only partial regard to commercial considerations, and the more costly productions of which were distributed as gifts to the rulers and to the public museums of other countries. The Prussian and Saxon Governments were now endeavouring to make their works self-supporting, and both at Dresden and Berlin a large trade was being done in articles of utility or of simple ornament. At Meissen there were at least a hundred workmen painting the familiar blue-and-white dessert services. The characteristic Dresden figures were produced at many private works also, and plaques and porcelain pipes were painted with remarkable cleverness and facility. At the Berlin works perhaps the most notable circumstance was that the ovens were all fired with gas from generative furnaces. The three great works of which he had spoken were under the direction of men of the first eminence as chemists and artists, and their achievements were too well known to call for more than passing notice. With regard to the potteries which he placed in the second category, he said their name was legion. There were to be found in every direction works of comparatively small extent, the productions of which were characterised by peculiar merits of their own, as shown by samples he produced for inspection. It was, however, only possible to refer to a few of these works by way of illustration. A few miles behind the great fortress of Ehrenbreitstein there were some ten villages in which, from an abundant local clay, the old Flemish stoneware was manufactured, and a very large trade was done in a great variety of these articles. The clay was thrown, then pressed into moulds, and when dry painted with cobalt. In one of these small factories he saw fifty girls so employed, and they seemed to earn the same wages they would get in Burslem. A technical school had been established at Höhr, the principal village, where the course of instruction included the modelling and actual production of the objects designed by the pupils. In the Black Forest and in Switzerland there were many small factories, at which the ware produced was ornamented by patterns, the outlines of which were scratched in the clay state, and then filled in with coloured "slips." The Governments had rendered great service to these and similar industries in many of the German States by the establishment of schools and museums. In the Black Forest there were some important manufactories, chiefly employed in making majolica and white ware for the American markets. In the petty States known as the Forest of Thuringia the cheap china figures which found their way everywhere were produced chiefly at the houses of the workpeople, from clay carried from the factory; and there, too, he had seen the gilt and painted china mug with inscriptions in English, which were to be had for 2½d., and the teapot stands embellished in like manner and sold to the trade for 6d., to find their way to Rhyl, Brighton, &c. The wages appeared to be about half the English rate, and house rent was quite as high as in the towns. The women rarely found em-

ployment in the potteries. Probably the most ingenious glass-workers in the world were found in the district of Thuringia, and he knew of no people with whose comfortable and intelligent appearance he had been more impressed. There were large factories so remotely placed that a waggon could only make one journey to the railway station each day. Most of their material had to be brought and all their manufactures sent long distances, and yet they were evidently, under many disadvantages, competing severely with English makers. Referring to the revival of the historic pottery at Delft, Mr. Woodall said that one of the finest technical colleges in Europe was to be found there, and its instruction was made directly applicable to the pottery, and the apprentices were taught drawing and painting by one of the principal professors, with results indicated by examples of the ware on the platform. Having briefly glanced at several other places, Mr. Woodall spoke of the potteries at Vallauris, and said there were many such to be found along the southern coast of France; but none more interesting than the well-known works of M. Clement Massier, at Golfe Juan, near Cannes. Specimens of the products of this factory, covering a wide range, from terra-cotta balusters and quarries to delicate statuettes, were exhibited by the lecturer, who pointed out that the vases and other like ornaments, resembling Linthorpe ware, were distinguished by the richness and variety of their coloured glazes. The productions of M. Massier were priced at what the lecturer considered very low figures. Not more than half a dozen women were employed in the factory, and under the new French Factory Act boys and girls were not employed until fifteen years of age. Turners earned from 2½ to 4½ weekly, and the less skilled workmen, who were chiefly Italians, earned 3s. per day. The working hours, exclusive of meal times, were ten every day. Rents were as high as in England, and the cost of many necessary articles higher. Compulsory military service did not appear to have any injurious effect, and its interference with the ordinary business of life was taken very much as a matter of course. Turning to the third class of works, the hon. member gave an instructive account of Limoges and its porcelain factories, of its splendid museum of ceramics, and of the great national school of decorators' art which had been established there for gratuitous instruction of all concerned in the local industry. At Saarguenines, which, although within German territory since the war, must be considered one of the great centres of French earthenware manufacture, M. de Geiger, who employed some 3,000 workpeople, modestly said he was obliged to rely upon ingenious machinery to enable him to compete with the superior skill of the Staffordshire potters; but he was, nevertheless, seriously and successfully competing with them. There, as at Maestricht, in Holland, were to be observed the very perfection of economic method. In conclusion, Mr. Woodall said he thought there was no reason why English potters should despair of being able to hold the position of which they were so proud, but they would see from what he had told them that this could only be done by their carefully applying themselves to the study of everything which could by any possibility have a bearing upon their industry.

### ST. CLEMENT'S CHURCH, ROWDELL.

A PAPER on the church at Rowdell, in the Isle of Harris, was read at the meeting of the Society of Antiquaries of Scotland on Monday. The author was Mr. Alexander Ross, architect, of Inverness. This church, situated at the south-east angle of the island, is cruciform in plan, with a square western tower. At some time it seems to have become ruinous, and the upper parts of the walls of the nave and tower have been rebuilt from old materials without much regard to character or design, a number of fragments of old moulded corners and sculptures having been built into the tower promiscuously, and the figures placed in most unlikely positions. The lower portions of the walls of the nave, the transept arches, and the side and end windows of the chancel end, are evidently of early date. There are two tombs with recumbent effigies recessed into the wall of the nave on either side of the south transept, the arches of which are of contemporary workmanship with the arches of the transept. The east window, of three lights, is cut out of hornblende schist, and is a remarkable work of its kind. The mouldings and labels on windows and tombs are decorated with rows of nail-head ornament. The principal tomb is, perhaps, the most remarkable example of its kind in Scotland. It contains the effigy of a knight in armour, of plate corresponding to the period indicated by the inscription in black letter on one of the panels at the back of the recessed arch, which attributes its erection to Alexander Macleod, son of William Macleod of Dunvegan, in 1528. This is the well-known Alaster Crotach (the Hump-backed) of Highland tradition and history; and the fact that the arches of both the tombs are of contemporary work with the arches of the transepts suggests that the Alaster Crotach may

have been, as Buchanan states, the founder of the church, at least in its present form. There is reason to believe, from the lands being called Ardmanach in the charter granted to Alister Crotach in 1498, that there may have been previously a monastic foundation on the site, of which, however, no traces now remain. The tomb of Alister Crotach is one of the most remarkable and richly-carved monuments in Scotland. Over his effigy, on the back of the recessed arch, and around its upper margin, there are no fewer than twenty panels of sculptures of religious symbolism, including representations of the Virgin and Child, *a pieta*, the Last Judgment, or St. Michael weighing souls and the devil sitting by as an interested spectator, a hunting scene, a galley, bishops or abbots, angels and nimbed personages in great variety, the total amounting to upwards of forty separate figures, and for the most part still in fair preservation. The other tomb is plain, but there is a carved panel representing the Crucifixion over the crown of the arch. A third effigy, for which there is no mural arch, lies in the south transept.

### THE ANTWERP EXHIBITION.

ON account of new demands for space, 20,000 more square metres of buildings are to be added to the Antwerp Exhibition Palace, which covered already 76,210 square metres on the first of last month. The concert-hall will cover a superficies of 3,000 square metres. The various countries will occupy, in square metres, superficies of—Belgium, 25,000; France, 20,000; Germany, 6,500; Italy, 4,000; England, 3,600; Austria, 3,000; the United States, 2,000; Russia, 2,000; Holland, 2,000; Sweden and Norway, 1,300; Canada, 1,200; Luxemburg, 600; Spain, 500; Switzerland, 500; Brazil and other States of South America, 200; San Salvador, Hayti, and Turkey, 150; Portugal, 100; Monaco, 100; Servia, 60; and Paraguay, 150.

### DRAINAGE REGULATIONS IN GLASGOW.

THE following regulations have been proposed to be carried out in Glasgow:—

1. The positions and sizes of all drains, pipes, cesspools, or traps, and all soil and rain-water pipes and conductors, shall be shown distinctly upon the plans submitted to the Court, and the weights per foot of the lead or iron soil pipes, conductors, and cesspools to be marked on said plans in figures.
2. Forty-eight hours' notice must be given to the Master of Works at his office, 74 Hutcheson Street, previous to commencing laying any drains. The party giving said notice will receive a card of permission to open the street, which card will be held as proof of the information having been lodged.
3. All connection between drains and the public or common sewer will be made by the workmen of the Statute Labour Department, and shall be paid for by the proprietor.
4. Every drain-pipe must have an uniform fall of not less than one inch to every lineal yard, and every pipe must be thoroughly packed and resting entirely on the solid. When, in the opinion of the Master of Works, the ground is soft, made up, or requiring to be made up to suit the levels, it shall be in his power to order concrete to be used under and around the pipes.
5. The joints of all pipes shall be thoroughly cemented, and any cement which may project above the bottom of the pipe inside must be carefully removed.
6. Sufficient traps and ventilation must be provided and fixed in position to the satisfaction of the Master of Works.
7. No pipes to be covered until inspected by the Master of Works or his representative; and no junction connecting drain-pipes and plumber work to be covered up until examined and passed by him.
8. The Master of Works to have power to use the smoke test on all drains and plumber work before the building is occupied, and at any other time he may consider necessary; all expenses connected with the test to be paid for by the proprietor of the property.
9. No dwelling-house to be occupied until a certificate has been given by the Master of Works that the drains and cesspools, with traps, have been properly constructed, and the house otherwise fit for occupation.
10. Proprietors and contractors to give every assistance to the Master of Works, or the persons appointed by him, for the purpose of making the necessary inspections.

The Master Wrights of Glasgow have formed an association for the purpose of promoting good feeling among those engaged in the trade, a thorough understanding of what might be required from time to time in the regulation of prices, and generally to consider all matters affecting the interests of the trade.

### Election of Surveyors of Dilapidations for the Diocese of Norwich.

SIR,—In reference to the paragraph in your last issue relating to this matter, will you allow me to state I was elected by a majority of twenty votes, twenty-four votes being recorded in my favour with four for the next candidate.

I am, Sir, &c.,

E. F. BISSHOPP,

Surveyor of Dilapidations for the Diocese of Norwich.  
32 Museum Street, Ipswich:

February 10, 1885.

### The Exhibition of Drawings at Conduit Street.

SIR,—The inhabitants of the earth all experience the illusion that the sun is a small disc travelling through the sky, for the same reason that the passenger in a railway carriage often thinks his train is moving when really it is the neighbouring train on the other pair of metals that is in motion. The opinion foreigners entertain about us is very often the judgment of history, for it is formed by persons placed outside our traditional prejudices and our temporary passions and interests. Last week the show of architectural drawings in Conduit Street received the visit of an artist from the Moon, and I was particularly amused by the remarks he made to me. Nothing could be more refreshing than his barbaric ignorance of the great names tacked on to the drawings. Our Barrys, Scotts, Streets, Ruskins, to whom we bow down with awe and reverence, produced no more influence on him than Browne, Jones, or Robinson, and his uncultured mind could evidently go no further than the drawings hung on the wall. "But, my dear sir," I pleaded, "the drawing you are praising is by a nobody, and the drawing you are so unmercifully pitching into is by the great XX, a man whose drawing is held in the highest esteem by all his fellow-countrymen." He looked as if he really did not understand my meaning, yet he has somehow learnt to speak English pretty fluently. I repeated my observation more strongly still and warned him that, if he did not show the highest appreciation for the works of XX, he would only be looked down upon as a poor benighted traveller from the Moon, and despised accordingly, unless he would consent to give his help to a British mission to convert his heathen, untutored, fellow-countrymen to a due appreciation of the works of the great XX. Would you believe it, Sir, this native of only a satellite had the impudence to shrug his shoulders and say he did not care a fig about XX, and even about Y and Z, but he judged works of art according to principles held as sacred in the Moon as the names of X, Y, and Z were held on earth.

"We are taught," said he, "from early childhood to distinguish two totally different elements in drawing. On the one hand, we recognise the science of drawing, which we teach in our schools at the same time as reading, writing, and arithmetic. This consists in imitating an object with such accuracy as to rival the results of your photography. It is a science entirely dependent on physical aptitudes: of hand and eye, as well as a training in drawing geometrical figures, such as squares and triangles, by means of which the draughtsman judges the dimensions of every part of the object he is drawing. In the Moon this kind of drawing is considered as part of the science of surveying and mensuration; its works are called diagrams, and are not considered works of art, although we know that on earth there are numerous makers of diagrams held in high esteem who think themselves the most excellent artists, and call those men daubers that would be regarded as artists in the Moon. If, with us, the science of drawing is nothing but geometry applied to the representation of objects, the art of drawing is knowledge of man applied to the expression of his ideas. It is entirely founded on the following well-experimented fact:—Take two pieces of cardboard, each bearing a name clearly printed thereon, put them an inch apart one behind the other, at about 2 feet from your eyes, and so placed as to see them both at one glance. Then rivet your attention on the first card, and you will see the print thereon sharp and black; but, as to the second card, you will just have an impression that it is there. You will neither see clearly its outline, nor the word printed thereon. Immediately your attention is called upon the second card, in an instant, short but perceptible, the first card is blurred, and the second card appears in full clearness. From this observation, the artists of the Moon have concluded that it is not possible for a man to see two things at one time equally clearly, and that, if he gives you a faithful drawing of what he sees, he will delineate one object distinctly, the other blurred. This is no doubt one of the imperfections of our nature, but our artists have found therein a powerful means of expressing

what they feel. In their drawings the blurred objects are those that do not interest them, the sharply defined are those that have called forth their special attention by awakening some tender memory, some enjoyment, some terror, or other emotion. Through the pictures of our artists, it is easy to look in the minds of their authors, for we have a record there of what charmed the authors and what did not. In looking at their works, our connoisseurs before all things ask what inspired the man—the bold outline, the graceful detail, the contrast of light and shade? They call this the intention of the artist; if they cannot find any intention whatever, they pronounce the picture a diagram and turn their backs to it, for the art-lovers of the Moon seek for *emotion*, not information. It follows therefore that, to the Moonites, the more work a drawing contains, the less art it implies; when a picture is perfect in every detail like a photograph, it ceases to be a work of art at all, and ranges as a very conscientious and praiseworthy diagram. As I was painting the portrait of an ugly yet pleasant lady of the Moon, my master told me, 'Paint the eyes, never mind about the rest.' He was right, for she existed to those who loved her but by her eyes, beaming with wit and kindness. Such is our way of considering art in the Moon.

"Of all your drawings the one that pleases me most is the sketch of an Egyptian temple by Sir Charles Barry. It is clear in outline, sober in detail, full of repose, and expresses throughout a clear and calm judgment. We have there an early promise of what its author was one day to achieve as an architect—broadly-conceived plans, noble and simple compositions. The coloured view of Athens by Professor Cockerell aims at the same ideal of simplicity, but less successfully than Barry; it is more finished, therefore less artistic. We have the feeling that with care and application we could achieve as much, whereas Barry's sketch, in which the essentials only are delineated, can be drawn by no lesser genius than his own. To the same school of drawing belong also the sketch of a church at Venice by Mr. Sydney Smirke and the portal of a castle on the Loire by Mr. Lethaby. Curiously enough, this style of drawing, which is essentially architectural drawing, is very sparingly represented at this show of the Institute; and, with the exception of the above artists, all the other draughtsmen seem to have been more or less preoccupied with pictorial effects when they have succeeded in making artistic drawings. Alas! there are a great many, and of the names you utter with bated breath, where it is useless to seek for any intention at all, whose drawings are nothing but diagrams to a native of the Moon. Such are the porch of Bristol Cathedral and a piece of the Law Courts by Mr. G. E. Street; but such is not the sketch of men in armour from Innsbruck Museum, done by the same artist in 1880, where every stroke tells of the enjoyment he felt in his subject.

"Of the pictorial artists, we have the men who delight in light and shade, at the head of which is Mr. Ernest George, in his pen-and-ink sketch from Holland, in which he nearly equals the etchings of his master, Rembrandt himself. In his colour sketches he is not so fortunate, as can be seen in his sketches at Chambord and Barcelona, which, although taken in very different regions, are identical in local colour and atmospheric effect. Next to Ernest George, as a light-and-shade artist, comes Mr. Haig, with his pen-and-ink drawing of the Cathedral of Seville. There is more labour, more of the finish of a photograph in Haig's drawing, and therefore, in my opinion, it ranks less high than Ernest George's sketch; on the other hand, Haig's coloured drawings bear the impress of faithful colouring. Then Pugin's Street in Mayence speaks of the artist; its admirable distribution of light and shade, and its bold sky-line, have alone delighted its author, for he drew nothing else, and was contented with vaguely indicating a detail here and there. It is truly a work worthy of the Moon.

"Then there are the painters of light and air, such as David Cox and Thomas Allom. After them we find the colourists, of which Mr. Rooke is *facile princeps*. The tones of his colours are so correct that we feel the very texture of the surfaces he represents, be they marble or plaster; it is no hazy colouring but solid matter we have before us. Then comes Digby Wyatt, not as an imitative but as a decorative colourist. See the red tablecloth introduced to harmonise as a high note with the red in the decoration of the vaults of San Bernardo. To these belong also Mr. Aitchison, in whose views of San Lorenzo and St. Mark correct colouring is united to sparkling effects of light and shade.

"The Impressionists are also represented in the Conduit Street collection by Mr. Waterhouse, with his sketches at Chartres and Angoulême, where the painter is enraptured with some striking effect, which he records. Sometimes it is the bold outline, sometimes it is only what gave expression to the original which he jots down on his paper—everywhere one feels the delicate nerves of a true artist. Next to him comes the pseudo-Impressionist, Mr. Ruskin, who feels not, but admires and imitates those who feel, and therefore gives us a caricature of their style, which his friends, no doubt, vastly admire.

"We now come to pen-and-ink drawings, made from designs for such commercial purposes as nailing a client or photolithographing in a periodical. The word 'commercial' freezes us up, but yet I cannot refute that there is a very poetical conception in the general grouping of the drawing by Mr. Norman Shaw. As a pen-and-ink drawing the Moonites would prefer that by Mr. J. Langham. There is a clear effect of light and shade which strikes us at the first glance: the landscape is highly finished by one who knows how to draw correctly trees and clouds, yet it is kept so subordinate to the building that we must make an effort to notice it. A higher praise to an architectural drawing we cannot give. Close to this is a drawing by Mr. M. B. Adams. It is perfect in workmanship, but he who admires Mr. J. Langham cannot be charmed with his neighbour. He might be by the sketch of Mr. W. E. Nessfield, which bears the mark of artistic intention, although the landscape reveals want of study from nature.

"The shaded drawing by Professor Brune is a model of what an architectural drawing should be: it is intensely accurate and clear, being a diagram for the builder to work from, and yet artistic intention is by no means absent. See the way the statues are drawn, the heads blocked out without a single detail. Does not the draughtsman say thereby, 'I am an architect; statues are for me only masses of light stone against dark backgrounds; whether their faces smile or weep I do not care'? Can anything be more clearly expressed?

"In the drawings of past masters such as Jones, Wren, the Brothers Adam and others, we recognise the cause of the little favour shaded drawing has found in England. It was done, but done so badly that it was neither pleasing nor useful. The shades were not drawn in with mathematical precision as in the work of Professor Brune, nor were the colours and shades graded, by which colours and shades look like what they mean, and not like so many black or coloured patches on white paper." "Stop, my friend," I exclaimed, "and take the next express for the Moon, for I fear you are on the road of attacking the great XX himself, and beware of my fellow-countrymen if you touch their idols." Our critic from the Moon turned round, and saw the room full of angry eyes of British architects fixed indignantly upon him. He became pale, quaked with fear, and suddenly darted upwards through the cupola of the ceiling, and has never been seen again. Such is a truthful account of this remarkable visit from our satellite.

Your obedient servant,

BRITISHER.

## NEW BUILDINGS.

**Maryport.**—Works for the erection of Messrs. Carr & Co.'s warehouse, at the Senhouse Dock, Maryport, have been commenced. The building will have a frontage to the new dock of 250 feet, and will cover an area of 15,000 feet super. It is being erected from plans and under the directions of Mr. T. Taylor Scott, architect, of Bank Street, Carlisle. Messrs. A. & J. Main & Co., of Possilpark, Glasgow, are the contractors; the foundations were let to Mr. A. Mackenzie, of Maryport, and the timber stage to Mr. John Bell, also of Maryport.

**Newcastle-under-Lyme.**—Post-office buildings lately in course of erection have been completed at a cost of about 1,600*l*. The style is Queen Anne, and the building is of red brick with Beggar's Well stone dressings. Plans, &c., have been supplied by Messrs. Chapman & Snape, architects, of Newcastle, jointly with the borough surveyor, Mr. James Pattison, under whose supervision the work has been carried out by the Rose Vale Brick and Tile Company.

**Hospital and Dispensary, Darlington.**—On Friday, the 6th inst., the new hospital and dispensary was formally opened by Mr. J. B. Hodgkin, mayor, on which occasion his worship was presented with a silver key by the architect, Mr. G. G. Hoskins, F.R.I.B.A. The key, which has been specially designed by the architect, and manufactured at his expense by Messrs. Harrison & Son, Darlington, is of solid silver, weighing four ounces. The handle or bow of the key is represented by a flaming heart of burnished silver, supported by beautifully designed frosted silver scrolls and leaves of a conventional character. One side of the heart bears the inscription, "Presented to J. B. Hodgkin, Esq., Mayor of Darlington, on the occasion of his opening the new hospital and dispensary, February 6, 1885," and upon the reverse side of the heart are inscribed the words (taken from 1 Cor. xiii. 13), "The greatest is charity." The stem of the key, besides being richly engraved, bears the words "Designed and presented by G. G. Hoskins, F.R.I.B.A." In addition to the aldermen and members of the Town Council and Hospital Committee, there was a large assembly of the general public to witness the ceremony. The several contractors have been—For excavator, bricklayer, and masons' work, Messrs. J. W. & M. McKenzie, of Darlington; carpenter and joiner's work, Mr. R. T. Snaith, Darlington; plasterer, Mr. R. M. Ormerod, Carlisle; slaters,

Messrs. G. Pattison & Son, Darlington; plumber and glazier's work, Mr. Emmerson Smith, Darlington; and painter's work, Mr. John Law, Darlington. Mr. Joseph Hindmarch was clerk of the works.

### CHURCH BUILDING AND RESTORATION.

**Adlington.**—A new church dedicated to St. Paul has been opened. It is built of stone, in the Early Decorated style, from the designs of Messrs. T. D. Barry & Sons, architects, of Liverpool, by Mr. T. Winward, builder, of Wigan.

**Middleton Junction.**—The church of St. Gabriel has been opened. The style of the building is Early English, and it consists of chancel, nave, north and south aisles, south porch, &c. The architect is Mr. A. W. Smith, Manchester.

**Ladhope.**—The foundation-stone of a church for the Ladhope Free Congregation has been laid. The buildings comprise church, large hall, session house, vestry, &c. The architects are Messrs. McKissack & Rowan, of Glasgow. The cost is estimated at about 4,000*l*.

**Gateshead.**—The foundation-stone of the church of St. Paul's, Teams, has been laid. The building is being erected by Messrs. N. & R. Reed, of Newcastle-on-Tyne. Messrs. Oliver & Leeson are the architects. The style of architecture is Late Perpendicular, treated without elaboration; what little tracery there is will be confined to the two-light windows of the apsidal-ended sacristy. The building will be of red pressed bricks, with stone dressings, and slated roofs. Internally all the roofs will be boarded, the nave and transepts roofs being waggon-headed in shape, and that of the chancel circular. Accommodation will be provided for 500 persons. The contract is for 2,898*l*.

### SCHOOL BUILDINGS.

**Blaina.**—New schools have been opened at Blaina, Mon., for the Aberystwith School Board to accommodate 1,200 children; the buildings are all one storey, and the style is Gothic, with details of a simple character. The walls are built of hammer-dressed Cross Keys stone, lined internally with pressed Ebbw Vale bricks. The roofs are open-timbered, with overhanging eaves, and are boarded and slated. A board-room and residence for the clerk to the School Board is being erected adjoining the schools. The total cost will be about 9,000*l*. The builder is Mr. John Jenkins, of Brynmawr, and Messrs. Blessey & Aspinall, of Cardiff, the architects.

**Nantyglo.**—A mixed school is being erected at Nantyglo, for the same School Board, to accommodate 330 children at a cost of 3,300*l*. Mr. Edward Morgan, of Tredegar, is the builder, and Messrs. Blessey & Aspinall, of Cardiff, are the architects.

### ARCHÆOLOGY.

**St. Ninian's Cave.**—A description of the recent excavation of St. Ninian's Cave, Glasserton, Wigtownshire, was read at the meeting of the Society of Antiquaries of Scotland on Monday. Local tradition has long assigned to this cave the honour of having been the retreat chosen by St. Ninian for purposes of prayer and meditation. In 1871 it was visited by the late Dean Stanley, and an incised cross was discovered on the rock near the entrance. Last year some other crosses were discovered on detached stones, one of which was presented to the National Museum by Mr. Johnston Stewart, of Glasserton. The explorations now described were undertaken in June last for the Ayr and Wigtownshire Archæological Association, and resulted in the discovery of a number of indications of the use of the cave in bygone ages—first as a simple shelter, and latterly as a chapel and place of pilgrimage. It was found that a wall had been built across the mouth of the cave, the lower portion of which, with four steps of a stair leading down to the cave floor from the higher level outside, are yet remaining. On one of the stones forming the steps, three crosses within circles are carved. Other crosses were found carved on the rocky sides of the cave itself. On one of the flagstones of the floor, immediately beneath one of these crosses, there was found a rudely-cut inscription, of which the words "SANCT NI" alone were legible. Outside the wall there was found a stone basin, cut in a rounded boulder, the cavity 7 inches diameter and 5 inches deep, probably the holy-water stoup of the cave chapel. There was a considerable accumulation of remains of food, consisting principally of broken bones of the ox and sheep, and at various depths there were traces of fires. Immediately outside the wall, and under a large stone, at a depth of 6 feet, a human skeleton was found, doubled up and much decayed. Except the carved stones and rock sculpturings of crosses, nothing of importance was discovered in the form of manufactured relics; but the tradition connecting the cave with St. Ninian has received notable confirmation from the discoveries made.

### ART SCHOOLS.

**Brighton.**—Mr. P. R. Morris lately delivered a lecture and distributed the prizes at this school. In the course of it he said:—The study and influence of art endowed the student with what was nothing less than a sixth sense, as it trained the eye to the discovery of beauties of form and colour never discerned before, and unfolded to the vision the greater mysteries and beauties of nature. A country might possibly be great without art, as a man could be strong and powerful without art, but the latter was not much better than a "glorified navvy"; and any country which neglected to educate its people in art could never take a leading place amongst the nations. The enormous amount of money spent on French art fabrics was simply due to the fact that that nation organised Art Schools about a century before we did; but now the English had almost turned the tables upon them, and had a style of design which was accepted at home and abroad as English, as bearing the national character, and having a national sentiment, which he conceived all art should have. Having referred to the national taste in design as being the outcome of the æsthetic movement started by Mr. Ruskin and a few other enthusiasts five-and-twenty years ago, and of the great wealth of artistic home decoration which Japanese art had been the means of introducing into this country, the speaker proceeded to criticise "Brighton taste" with reference to the painting of the minarets and stone-work of the Royal Pavilion, the introduction of Chinese figures, and even camels, into the decoration of the banqueting-room of the same building, and the decorations of the balconies of the Grand Hotel, which now had the appearance of rust, work which, he said, they had taken a great deal of trouble to do, but which had better have been left alone. Knowledge in art would, however, remedy these defects in taste, and the art education which the country was now receiving would also stimulate the artist to put forth his very best effort, as they did not like their predecessors paint for a small educated circle, but for an educated public.

### GENERAL.

**Mr. Clark Stanton, the Sculptor,** was, on Tuesday, elected an Academician of the Royal Scottish Academy.

**Sir Edward Reed, K.C.B., M.P.,** has, at the personal request of the Prince of Wales, accepted a seat on the Jury Commission of the International Inventions Exhibition to be held at South Kensington.

**Bastien Lepage's "La Coquette"** was sold on Saturday at Messrs. Christie's for 246*l*. 15*s*. It was painted in 1882.

**The New Orleans Exhibition** has already resulted in a deficit of 319,422 dollars. Congress has been asked to vote a further subsidy.

**Tablets** are to be erected in the Memorial Aisle of Harrow Chapel in honour of the late Colonel Burnaby and Lord St. Vincent.

**A Society of Painters in Water-Colours** is about to be established in Switzerland, with M. Alfred Berthoud, of Neuchâtel, as president.

**The Ecclesiastical Commissioners** have given a site for the new Norwich Diocesan Training College for School-mistresses, the existing building having been condemned by the Education Department.

**Mr. Colin Minton Campbell,** the principal partner in the firm of Messrs. Minton, died on Saturday last, after a long illness. He was born in 1827. Mr. Campbell was one of the members for Staffordshire from 1874 to 1880.

**M. A. T. Monge,** one of the architects of the French Government, and a member of the Council General for Buildings, died in Paris on the 6th inst., in his sixty-third year. For a long period M. Monge had been mayor of Etretat.

**Mr. Sydney Colvin** was on Wednesday re-elected Slade Professor at Cambridge.

**The Colchester Board of Guardians** propose to improve the accommodation for vagrants at the Workhouse, under the direction of Mr. J. W. Start, architect, Colchester.

**Germany** has declined to take any official part in the International Exhibition at Antwerp.

**The Marquis of Bute** has given 50*l*. towards the erection of a Bath Hospital at Harrogate.

**The Plans** of Mr. John Lord, of Brighouse and Bradford, have been selected, in limited competition, for the proposed new Local Board offices at Brighouse.

**A Town-hall** is to be erected in Pesth. The site proposed is now occupied by the Karl Barracks on the Karl Boulevard.

A Business Supplement

## RESTRICTIONS TO THE USE OF PLANT.

FROM a decision which was given last week in the Court of Session, Edinburgh, it is plain that the novel use of a machine or any kind of plant involves a contractor in a liability which could not exist otherwise. In last March a contractor undertook to remove the rails used for waggons at a colliery belonging to the Marquis of Lothian. In order to shorten the operation of lifting the rails, he borrowed a crane from his lordship and mounted it on a bogie. It was an original and ingenious plan. The crane was not used up to its full strength, but in consequence of a flaw in the casting it broke, and, in falling, a man was killed. The widow brought an action, seeking 250*l.* compensation. The case was heard in the Sheriff Court, and judgment was given for the contractor, for it could not be proved that he was in fault. An appeal was heard in the Court of Session, and two out of three judges were in favour of reversing the judgment. The reason for the decision apparently was that to use a machine or tool for more than one purpose is "improper."

Lord Young in the course of his judgment spoke as follows:—It was ascertained that there was a flaw in the crane undiscoverable by inspection beforehand, and the Sheriff being of opinion, upon the evidence, that the strain which was put upon the crane at the time at which it broke did not exceed 24 cwt., while it was guaranteed to bear a strain of 30 cwt., was of opinion that the break was attributable to the latent flaw, for which the general user of any machine was not responsible, and that this relieved the defender of the liability which, his lordship supposed, the Sheriff thought would otherwise attach from the improper use—in short, that although there had been improper use, and the accident had happened, and damage had been done, it would be a sufficient answer of the man who otherwise would have been liable, that but for the latent flaw in the instrument so improperly used it would not have happened, and so the accident would not have happened, and therefore liability would not attach. His lordship was not prepared to assent to that proposition. But he did not think it necessary to decide that abstract question in the present case, for he was not of opinion with the Sheriff-Substitute that it was satisfactorily proved by the party defending the improper use, that but for the flaw the accident would not have occurred. The evidence with respect to the crane, and the propriety of using it for the work, was striking, and was all the one way. He assumed that the evidence was by a competent man, Mr. Robert Farstairs, a civil engineer, who was cited by the defenders, and who was instructed by the public authorities to inquire into the case, and was to the effect that the pulling up of rails was not a proper use to put a crane to, and that a crane lost in strength if it was not kept up. The defender put it to an improper use, and kept it at that use until it broke, and this was the only test which he applied of its suitability for the work. If the proposition

were sound at all that a latent defect would excuse a party from the consequence of the improper use of a thing in which a latent defect was found, his lordship thought the case must stand upon much clearer evidence than the calculation here, that the strain upon a machine improperly used was short of its guaranteed strength. He did not think that a man, even with a proper use, was entitled to put that crane, which he had never tested, to raise a weight up to the guaranteed strength. Upon the whole matter he was of opinion that the judgment here was erroneous. He quite approved of the decision which was referred to in a Queen's Bench case quoted, to the effect that a servant shall not have an action against his master who was using an ordinary machine. But the present case was one of unprecedented and improper use of a machine upon the only evidence, uncontradicted, in the case, and therefore it did not come within that class at all where an action was sought to be laid for an accident occurring in the ordinary course of business. He, therefore, thought the judgment of the Sheriff ought to be altered, and that they should find that the accident was attributable to the fault of the defender in having applied a crane to an improper purpose, and therefore he was liable in damages. Lord Craighill concurred.

Lord Rutherford Clark, on the contrary, took the other side, and his opinion will commend itself to practical men. His lordship said that it did not appear that the crane lost any of its original strength, and in point of fact the fall of the crane was entirely caused by a certain latent defect. Unless it had been proved that the strain exceeded the guaranteed strength of the crane, the impropriety of the use to which it was put did not appear to his mind so obvious. He took it that the men were working the crane very considerably within the limit of its strength, and that this accident would never have occurred at all but for the latent flaw. He was, therefore, of opinion that the defender was not making any improper use of the crane if he proved—and he thought it was proved—that there was no improper strain upon it so as to endanger life. But as two of the judges were in favour of the plaintiff, judgment was given accordingly with damages amounting to 100*l.*

## APPOINTMENTS VACANT.

HENDON.—Feb. 21.—Applications are required for the Appointment of a Surveyor. Mr. Samuel Tilley, Clerk to the Local Board, Hendon, N.W.

HONITON.—Feb. 18.—Applications are required for the Appointment of a Surveyor. Mr. G. T. Tweed, Town Clerk, Honiton.

NORTHAMPTON.—Feb. 21.—Applications are required for the Appointment of a Surveyor for the Trustees of the Church Charities. Mr. W. Terry, 4 Derngate, Northampton.

WILTON.—Feb. 19.—Applications are required for the Appointment of a Surveyor. Mr. G. M. Wilson, Clerk to the Wilton Rural Sanitary Authority, 12 Bridge Street, Salisbury.

## AUCTION SUMMARY.

For the Week ending Feb. 21.

(See Advertisements.)

TUESDAY, 17th:—

Messrs. Farebrother, Ellis, Clark & Co.—Freehold Building Estate, Lavender Hill and Wandsworth Common. Freehold Property, St. John's Hill, Wandsworth Road.

## COMPETITIONS OPEN.

BEVERLEY.—Plans are required for the Beverley Dispensary and Hospital, for Accommodation for Twelve Patients, with Residence for Medical Officer, &c., cost not to exceed £1,500. Mr. Brigham, Dispensary, Beverley.

CHELSEA.—Feb. 25.—Plans are invited for Additions to Vestry Hall. Premiums of 100*l.*, 50*l.*, and 30 guineas. Mr. J. Elsdell Salway, King's Road, Chelsea, Clerk to the Vestry.

CROYDON.—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100*l.*, 30*l.*, and 25*l.* for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

LONGTON.—Feb. 20.—The Longton School Board are about to erect two sets of schools at Normacott and Florence, each to accommodate 700 scholars (220 boys, 220 girls, and 260 infants), and invite architects in the Potteries and Newcastle to send in designs and estimates. Mr. Geo. C. Kent, Clerk to the School Board, Longton.

WINDSOR.—Feb. 28.—The Town Council of New Windsor invite designs for a panel of tapestry to be fixed in the Guildhall. Three prize-winners will be invited to compete for the cartoon from which the panel of tapestry will be woven. The Town Clerk, 4 Park Street, Windsor. Competitors must be resident within five miles of the Guildhall, Windsor.

## CONTRACTS OPEN.

ABERDEEN.—Feb. 14.—For Building Retaining Walls, &c., to School. Messrs. Lawrence & Rosser, Architects, Newport, Mon.

BATLEY.—Feb. 18.—For Building Five Terrace Houses. Mr. W. Hanstock, Architect, Branch Road, Batley.

BATH.—Feb. 23.—For Supply of Glazed Stoneware Sewage Pipes and Gully Traps for twelve months. Mr. Alfred Mitchell, Engineer, Municipal Offices, Market Place, Bath.

BEDFORD.—Feb. 24.—For Plans and Specifications and Execution of Works in connection with Sewage Pumping at Outfall Works. Mr. J. Lund, Borough Surveyor, Corn Exchange, Bedford.

The Superintendent, Harbour Works, Kinsale. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

# RENDLE'S ACME GLAZING

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

## SALES BY AUCTION.

**FOY, MORGAN & CO.** beg to announce that their Next PUBLIC AUCTION will take place on

WEDNESDAY, MARCH 4, 1885,

at the BALTIC SALE-ROOM, Threadneedle Street, E.C., when they will offer their usual assortment of DEALS, BATTENS, BOARDS, TIMBER, &c.

Catalogues will be issued in due time.

**FOY, MORGAN & CO.** {Wood Brokers, 108 Bishopsgate Street Within, E.C.

**Lewisham.**—Second Portion of the Priory Estate.—Pleasantly situated, with important frontages to Lewisham High Road and the new roads leading therefrom; close to Ladywell Station, and within a short omnibus ride of Lewisham Junction Station, whence frequent trains run to the City and West End.—Freehold Building Land and fine old Mansion, which could be easily subdivided into two or three residences; also a very valuable tavern plot and a splendid walled-in kitchen and fruit-garden, well stocked, and containing vineyard and forcing pits, &c. Easy payments. Free conveyances. Subsoil sand and gravel.

**MR. RICHARD J. COLLIER** having sold the whole of the first portion, will SELL by AUCTION, at the Plough Tavern, High Street, Lewisham, on Monday, February 23, at Six or Seven o'clock in the Evening, a further portion of this valuable estate, comprising about 50 lots of highly FREEHOLD BUILDING LAND, free of title and land tax, including several capital shop plots and a magnificent site for a tavern; also the fine old mansion known as The Priory, and a well-stocked kitchen and fruit garden, with vineyard, &c. Plans and particulars may be obtained of C. A. Russ, Esq., Solicitor, 62 King William Street, E.C.; of H. Davis, Esq., 2 Arthur Street East, London Bridge; at the place of sale; of the brewer on the estate; and of the Auctioneer, 28 Finsbury Avenue.

BEKHILL-ON-SEA.

between St. Leonards and Eastbourne, with Railway Station on the Estate.

**MESSRS. E. & H. LUMLEY** beg to announce that the extensive improvement works which have been carried on at a cost of about £20,000 are now complete, and invite the attention of builders, contractors, and capitalists to the valuable sea frontage now ripe for buildings. Leases will be granted on easy terms, and every facility afforded for developing this very promising seaside town.

Plans and particulars may be obtained of Lumleys, agents to the freeholder, the Right Hon. Earl DE LA WARR, at 22 St. James's Street, Piccadilly, S.W.

To Land Companies, Building Societies, Speculators, and others.—Lavender Hill and Wandsworth Common, S.W.—A highly important Freehold Building Estate (land tax redeemed), comprising nearly nine acres, occupying a most commanding position, extending from St. John's Road to Wandsworth Common, to which it has together over 1,000 feet of frontage. The property is situated only a short distance from Battersea Park and Clapham Common, adjoining St. Mark's Church, within two minutes' walk of Clapham Junction Station, giving exceptional facilities of access to the City and all parts of town, while good service of trams passes close to the estate at frequent intervals. The land, which slopes gently towards St. John's Road, is almost the only property in the neighbourhood yet uncovered, and is in the midst of a locality where houses of a moderate class are in constant demand. It is ripe for immediate building operations, and possesses unusual advantages for development, its position being such as to enable the whole estate to be most profitably dealt with. Possession on completion of purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK** & CO. have received instructions to offer the above valuable FREEHOLD ESTATE for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two o'clock precisely, in one Lot.

Particulars, plans, and conditions of sale may be obtained of Messrs. Maples, Teesdale & Co., Solicitors, 6 Frederick's Place, Old Jewry, E.C.; of Sharon Grote Turner, Esq., Solicitor, 56 Lincoln's Inn Fields, W.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

The adjoining Freehold Property, as set out in the following announcement will be sold at the same time and place.

**St. John's Hill, Wandsworth Road.**—A valuable Freehold Property, ripe for building development, with an extensive frontage to St. John's Hill. This important site covers rather more than an acre, and is admirably circumstanced. There is at present on the land a detached cottage residence, with stable and outbuildings, and possession will be given on completion of the purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK** & CO. will SELL this valuable ESTATE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two o'clock precisely, in one Lot. Particulars, plans, and conditions of sale may be obtained of Messrs. Maples, Teesdale & Co., Solicitors, No. 6 Frederick's Place, Old Jewry, E.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

**FULHAM, S.W.**—A valuable Freehold Building Estate, comprising altogether over 13 acres, with three detached residences thereon, occupying a commanding position in one of the main thoroughfares in this rising neighbourhood. It is situated only a short distance from Hammersmith Broadway and the new St. Paul's Schools, close to the proposed Hammersmith and Fulham recreation grounds, and almost adjoining the extensive cricket-ground in course of construction on the Baron's Court Estate, while it possesses unusual facilities of access, being within a few minutes' walk of five railway stations, and close to good omnibus routes. The land, which contains excellent gravel, and sand, possesses an extensive frontage to the Lillie Road, is ripe for immediate building operations, and forms one of the most important estates recently brought into the market in this locality. There are also two detached plots in Margravine Road, eminently suited for the erection of cottage property. Possession of the greater portion on completion of the purchase.

**MESSRS. FAREBROTHER, ELLIS, CLARK** & CO. have received instructions to offer the above important Estate for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, March 17, 1885, at Two o'clock, in Two Lots. Particulars, plans, and conditions of sale may be obtained of Messrs. Few & Co., Solicitors, 19 Surrey Street Strand, W.C.; of Messrs. Simpson & Cullingford, Solicitors, 85 Gracechurch Street, E.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

VINE STREET, CLERKENWELL.

Freehold Building Site. With possession.

**MESSRS. FAREBROTHER, ELLIS, CLARK** & CO. will SELL by AUCTION, at the Mart, E.C., on Thursday, March 5, 1885, at Two o'clock, a valuable FREEHOLD BUILDING SITE, having an area of about 4,300 feet super., with a frontage of 119 feet to Vine Street, and abutting at the rear Strand, W.C.; of Messrs. Simpson & Cullingford, Solicitors, 85 Gracechurch Street, E.C.; at the Mart; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

Particulars may be had of A. W. Surtees, Esq., Solicitor, 35 Bedford Row, W.C.; at the Mart, E.C.; and of Messrs. Farebrother, Ellis, Clark & Co., 29 Fleet Street, Temple Bar, and 18 Old Broad Street, E.C.

[For remainder of Auctions, see page x.]

Royal Institute of British Architects,  
9 Conduit Street, Hanover Square, London, W.

**ARCHITECTURAL ASSOCIATION,**  
9 CONDUIT STREET, W.

The Tenth Ordinary Meeting will be held on Friday evening next, the 20th inst., commencing at 7.30, when a paper will be read by HERBERT A. GRIBBLE, Esq., entitled "The Roman Renaissance."

W. H. ATKIN BERRY,  
HERBERT D. APPLETON, } Hon. Secs.

TO

**ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.**

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt., more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from waste, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."

WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL

Cream, Fumigators, &c., &c.

AS SUPPLIED TO 600 PUBLIC HEALTH  
BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy." "JAMES WEIR, F.R.I.B.A.

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 80 Duncan Terrace, City Road, London.

Works—TYLDESLEY, near MANCHESTER.

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

Diffuser with Filter.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The **DEAN OF YORK**, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

Air Extractor.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII, and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{2}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in hospitals, banks, hotels, many offices, private residences, &c., with most satisfactory results. Set on a tiled or mosaic floor within walls or a dado of glazed tiles, in appearance and action they leave nothing to be desired. The usual wood framing, forming a storehouse for the retention and accumulation of damp, dirt, and disease germs, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a slop sink or urinal, and with the absence of framing the body assumes a more natural position, which is found greatly conducive to convenience and comfort in use.

**GEORGE JENNINGS,**  
SANITARY ENGINEER, STANGATE, LONDON,  
A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED. S.E.

## BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

- Receives and disconnects one Rain-water Pipe and Three Waste Pipes.
- Avoids all Splashing.
- Ventilates the Pipes and Trap.
- Forms Drain for Area or Surface.
- Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT WORKS, 8/6 EACH.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

VOLUME XXXII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

Printed by SPOTTISWOODE & CO., at No. 5 New-street Square, E.C., and Published by the Proprietors, GILBERT WOOD & CO., at the Office, No. 175 Strand, W.C., London.  
Saturday, February 14, 1885.

# The Architect.

## THE WEEK.

IT is satisfactory to know that the 20th Middlesex have been among the earliest, if not the first, of the volunteer corps who have offered their services to the Government for garrison duty in the metropolis at the present crisis. Under the command of Lieutenant-Colonel EDIS the regiment is in a most efficient state, and there is no doubt that if the authorities wish to take advantage of the offer, the duties will be performed with soldierly precision.

MR. HODDER M. WESTROPP, whose death has been announced, was an industrious writer of useful books on archæology, in which an effort was made to popularise the subject for the sake of people who take up a study on the run-and-read principle. He lectured on Greek art of all periods, Roman Temples, Ancient Painting, the Catacombs, &c. Having lived in Rome, he was engaged to deliver three lectures in the Royal Institution on the recent discoveries in that city. He compiled books on "Precious Stones and Antique Gems," "Painted Vases," "Pottery and Porcelain," "Imperial Rome," "Homeric Doubts," but we understand that his most successful work was "The Handbook of Archæology."

LORD BRABAZON points out a danger which seems to await the Water Gate, by INIGO JONES, in the garden at the end of Buckingham Street. It is apparently so much neglected by the Metropolitan Board of Works and the Office of Works, that we are not surprised a railway company should schedule it. The proposed railway between Euston Station and Charing Cross is to be carried for the greater portion of its length in the line of the proposed new street from Trafalgar Square to Oxford Street. In connection with the railway a short street is contemplated, from St. Martin's Place to the Victoria Embankment, terminating at the Metropolitan District Railway station at Charing Cross. The centre line of this street passes York Gate at a distance of about 30 feet to the northward. It does not follow, however, that a line so placed would involve the destruction of the gate, and if it had to be taken down it would be re-erected. The use of the Water Gate is no longer apparent since the Embankment was constructed, and it does not even indicate the former level of the Thames. As it has ceased to be a record, it would be an advantage to have the whole of the structure visible, and as the authorities will not restore the gate, why should not the railway company make us their debtors?

THE Peabody Trustees, in their annual report, say that within the past year they have expended on land and buildings 80,903*l.* 10*s.* 11*d.*, making the total expenditure 1,170,787*l.* 3*s.* 5*d.* During the year the trustees opened eleven blocks of buildings at Pear Tree Court, Clerkenwell, containing 514 rooms, all of which are now occupied. Eight blocks at Little Coram Street, containing 450 rooms, were completed in December last, and are now being let. Five blocks at Islington are in a forward state, and will be opened before midsummer, and five blocks to be erected partly on the Old Pye Street site and partly on the Great Peter Street (Westminster) site will, it is hoped, be ready for occupation by the end of the present year. When these buildings are completed, the trustees will have spent the whole of their capital, and will be unable to erect any more buildings until the loan from the Public Works Loan Commissioners is paid off. Up to the end of the year the trustees had provided for the artisan and labouring poor of London 10,144 rooms, besides bath-rooms, laundries, and washhouses, occupied by 18,453 persons.

THE Archbishop of CANTERBURY has undertaken the difficult office of arbitrator in the dispute over the restoration of Peterborough Cathedral. Reverence for His Grace's position may induce the Dean and Chapter and Restoration Committee to accept the Archbishop's decision. But it is not a question of theology that is involved, and, with all respect,

it must be said that His Grace's utterances on art are not evidence of a toilsome study of the subject. In a remarkable address which was delivered in Birmingham, the Archbishop was supposed to have referred to the *Venus of Melos* as if it were the work of a famous sculptor of that name, thus imitating the example of a London daily newspaper. The cathedral authorities and a committee have a most careful architect: would it not be wiser to trust to Mr. PEARSON'S impartiality?

IN an address which was given on Tuesday in Edinburgh, Mr. COCHRAN-PATRICK, M.P., explained the need of an official survey of historical monuments in Scotland, by which they would become national property. In 1807 the Danish Government adopted the plan of taking over some isolated monuments. But it was found from experience that a larger control was necessary, and in 1873 it was decided to try the experiment of dividing the country into districts, and to send to each district a qualified artist and competent archæologist to place on paper, with absolute fidelity, everything of archæological and historical interest in the country. In Scotland a few of the local societies are about to begin surveys of the kind, and to prepare drawings of all the remains which can be considered of importance. The example is deserving of imitation in England. It is forgotten, apparently, that about fifty years ago the Government did commence an archæological survey in Ireland. Preparations were made for conducting the work on a scientific basis, and the late Dr. PETRIE, who was one of the most cautious archæologists, was appointed director. But owing to influential opposition the work was summarily stopped, and the only products of it to which the public have access are a small volume and an essay. It is understood that a large amount of information exists in manuscript which is never likely to be printed. The expense may frighten the Treasury; but another objection may arise from the difficulty of deciding what archæological theory merits preference and official sanction.

THE extension of the District Railway between the Mansion House and Tower Hill stations was described by the engineer, Mr. WOLFE BARRY, at the Institution of Civil Engineers on Tuesday. It is remarkable that the works cost 20,000*l.* less than the Parliamentary estimate, and the cost of the land was less than was expected. The Parliamentary estimate was, for the railway and land, 2,365,261*l.*; for street widenings and a new street, 929,412*l.* After lengthy negotiations, it was agreed that the Metropolitan Board of Works should contribute 500,000*l.* and the Commissioners of City Sewers 300,000*l.* towards the undertaking. The works were commenced in August 1882, and were completed and opened for traffic (together with the Whitechapel extension) in October 1884.

THE pleasure which good people take in maligning architects was once more exhibited during the hearing of a case before Mr. Justice SMITH on Wednesday. A firm of builders undertook the contract for a section of a church in Devonshire according to plans by Mr. ALFRED NORMAN. Although the contract amount was only 1,645*l.*, a balance of 522*l.* was left unpaid. The architect's conditions were stringent, but the builders appeared to have fulfilled them; so the only way that presented itself to the impecunious building committee to evade payment was to blacken the character of their own architect. Accordingly it was alleged that many of the items in the plaintiffs' account were unfair and unreasonable charges; that by agreement no "extras" over 10*l.* in amount were to be charged for, unless the order for such extras had been countersigned; and, finally, that the architect had granted to the builders certificates which he had no right under the contract to grant, and they therefore did not bind the defendants. At the trial Mr. NORMAN gave evidence that there was not the slightest ground for suggesting collusion between the builders and himself, whereupon the church builders said they wished to withdraw all charges of the kind, although he believed that sufficient attention had not been given by the architect, &c. The judge interpreted the contract-deed according to its plain meaning, and held that the architect's decision was to be final and without appeal. Judgment was therefore given for the full amount of the claim with interest.

## TECHNICAL EDUCATION.

AN experiment was tried a few years ago by one of the branches of the London carpenters which deserved more attention than it received. A body of the younger members living about Pimlico engaged, or rather it might be said persuaded, a builder's manager to undertake the superintendence of evening classes for technical instruction. The men were poor, and they found great difficulty in obtaining a place for study. It would have been easy to secure the aid of enterprising publicans or beerhouse-keepers; but, although one of their rooms may answer well enough for society meetings, it is hardly a place in which to pursue scientific studies. The sum asked for the use of a large room was far beyond the means of the men, and the scheme was nearly collapsing, when a clergyman in the district offered the use of a school on the condition (as his congregation was poor) of paying a small sum for gas. No sooner was a room available than the classes were opened, and both teacher and students worked with an enthusiasm that would do credit to any college class. The couple of hours were occupied in very hard study. The teacher was acquainted with every detail of the craft, and he was able to employ technical terms which, however expressive and figurative, are almost unknown outside workshops. There was none of the formality of the lecture-room, and care was taken on both sides that what was said was understood. Anyone who attended the meetings might well conclude that the stuff of which educated workmen are made is to be found in London and of quite as good quality as in Paris or Stuttgart. The Pimlico students did not receive much recognition from the parent society or from builders, and they were ignored by architects. In a short time the men began to feel that they were peculiar, which to the English workman's mind is nearly the same thing as disloyalty to his fellows, and although the expenses were nominal, the classes did not prosper, and were discontinued.

After reading the evidence which was given before the Commission on Technical Instruction, and considering the costly failures of past years, the experiment is recalled to our minds, and we cannot help thinking that the humble Pimlico carpenters did reveal the conditions under which technical education will have to be carried out if it is to be successful in this country. The motive-power must be found in the trade itself. Experience has shown in a good many ways that the English operatives will not be patronised. Model lodging-houses are not tenanted by them although originally planned for their benefit, and they have never given much custom to the benevolent institutions which have been established for the reformation of the working-classes by means of adulterated coffee and insipid liquors. In the Potteries some of the masters pay the fees for their apprentices in the art schools, but the youths who pay their own scot attend more regularly than those who are franked. The genuine workmen are a minority in the evening classes of the schools of the Science and Art Department, and it is well known that the subscribers to the Mechanics' Institute are not all mechanics. It is only in towns where tact is shown in recognising the peculiar spirit of the workman that those institutes can be said to possess a representative character. The reason of so much independence is not difficult to seek. It will, we think, be found in the objection which the English artisan has to be made a tool for somebody else's advantage. And it is all the same to him whether it is proposed to utilise him as a subject in philanthropic, industrial, educational, or political schemes.

The system of the Science and Art Department in its working, whatever it may be in theory, is enough to make a shrewd workman somewhat suspicious of the motives with which the classes are established. Payment on results is all very well if the teachers could be entirely disinterested and the tests infallible. But when it is found that pupils are crammed and trained with an eye to the trainers' payment, the last to admire the system are the pupils. It is not complimentary to human nature to find itself operated on like cattle and poultry for the Christmas market, and fed on a sort of intellectual oil-cake. That this is done is certain. Professor HUXLEY has been examiner under the Department from its commencement, and he told the Commission that "there is a pestilent minority of teachers now,

and always has been, who have no other object in the world than to earn payments, and what they do is this. They get together all the questions that have been put, and form a notion what questions will be set, and they concoct a set of cut-and-dried answers, and make their pupils learn them by heart as if they were learning the catechism." Children in a charity school may be filled with stuff in this way, for it is a fraud to call it teaching; but it is absurd to suppose that an artisan who is probably a grand officer in his lodge will eagerly undergo the operation, no matter how many eloquent throats have grown hoarse in expounding its advantages. In art classes the regulatory power is likewise the master's profit. Mr. WEDGWOOD, in speaking of the schools in the Potteries, tells us how "a master by the system of farming other subsidiary schools is now able to make from 800*l.* to 1,000*l.* a year, and we cannot afford to pay that for one. Our last master, who was an excellent man, left us more than a year ago to go to Derby, because, by farming Chesterfield, Leek, and two or three other schools, he was able to make 1,000*l.* a year. It is a bad system, because it fritters away his personal interest in his pupils, and prevents his obtaining power over them. He has not time to attend to them, or the chance of evoking that enthusiasm in their work which is the chief mark of good teaching in a master." This description may be taken as applicable to other places. It is not altogether the fault of the teachers, many of whom we know are most zealous, and carry on their work without much regard for pecuniary profit. Nor is it easy to propose a better system for the whole country. It is enough for our present purpose to say that the defects of the system are as well known to artisans as to the authorities, and that the former have no interest in screening them.

The cramming system has its temporary use, but it is not able to sustain the tests that business supplies. We are told that Messrs. MINTONS, who were in the habit of giving a cheque to meet the deficit in the local art school, have discontinued so much liberality on the ground that the school was of little use to them. Mr. WEDGWOOD says that although he asks whether a youth has attended a school of design, he attaches less importance to his proficiency there than to his character and industry. "As a rule," he says, "the schools of design turn out slow draughtsmen; boys trained on the works are more suited to our requirements, more ready draughtsmen, with more appreciation of time as an element in the value of work." In practical science there is a still greater disappointment. The Whitworth scholars, who represent the very highest degree of official instruction, are apparently not in esteem in all manufactories, and the manager of one ironworks said they were inferior to ordinary men. No doubt the winning of a prize like the Whitworth may have the effect on minds of a certain class of making labour distasteful, but the possession of so much knowledge ought to be a gain. If, however, a prizeman is of less value than say a foreman who is trained altogether in workshops, what is to be said of the humbler class of students? Mr. CHANNON, a bricklayer, who gave evidence, said to the Commissioners, "I have been through the examination myself, and the use it has been to me as a bricklayer is utterly valueless." There is perhaps a little exaggeration in the statement, but it expresses fairly accurately the opinion of the Department's teaching among artisans. Thus we find a carpenter saying, "The science and art classes are apt to make a student too much of a theoretical man. He may go through their course of solid geometry and building construction, which are the two most useful subjects he can take up, and he would still be wanting in technical knowledge, because there are a great many things which are not laid down in the syllabus, nor could they lay them down because their teachers would not know how to handle them." A workman often expects too much profit from a course of lectures, or the lessons of a single term, and the statements we have quoted might be supposed to have arisen from disappointment. But men of a higher class, who take an interest in the maintenance of the Department, are also compelled to condemn the deception which is carried on in the form of teaching. For example, Mr. WILLIAM ANDERSON, who has had long experience, as the head of an engineering firm, in the training of pupils, says that the classes are not satisfactory on account of the character of

the teachers:—"Young men who know what good teaching is will not attend; they know it is all nonsense. There was a man who gave a course of lectures on chemistry and physics, one of which I went to hear, and all I could say of it was that it was simply beneath contempt. A good many young men attended those lectures at first, but they dropped off one after the other; they felt it was no use attending them." This is no exceptional opinion, and the evil described is so general we need not be surprised if people begin to doubt whether the old-fashioned way of training was not better adapted to produce more sterling workmanship.

The defects of the Department's schools of science and art all seem to arise from one cause. Too much is attempted. BLACKSTONE says that the Courts of Equity became a necessity owing to the evils which arose from the universality of the statute and common law, and the universality of the Government schools has grown to a state that demands a remedy. No one can say what is the purpose of the schools. They are not schools of design, or of manufactures, or educational establishments in the ordinary sense of the phrases. This want of a definite aim has encouraged vagueness in teachers and students, and in examiners too. Let us take the last, for something should be said about the tribunal which puts the seal on the works of the art schools. Every one knows of the national competition, in which the very best works produced in the schools are scrutinised. A practical character is needed in this part of the system, even if dispensed with elsewhere, for the merit of a design depends on its capability for execution. The judges should, therefore, be men who have had experience in manufactures. Now, let us see how the work is done. Colonel DONNELLY, the chief of the executive, was asked by one of the Commissioners to say what steps are taken to insure that the designs which are sent up are submitted to persons who have acquaintance with the particular manufacture to which the designs are intended to be applied, as in the case of lace. The reply was, "I may say that generally there is somebody appointed to examine the design, who is more or less conversant with the particular industry to which the design is intended to be applied, for instance, Mr. MORRIS, who is technically conversant with one or two branches of industry. I do not know who specially looks after lace, but I think we have somebody conversant with lace-making." It will be observed that almost every second word suggests doubt, and when the director is in this condition, how can the awards in lace be expected to give satisfaction in Nottingham? The same question was put to Mr. BOWLER, Assistant Director of Art, and he answers, "We have not practical men for metal work, for instance; but the artists who act as judges are competent to say whether they would be good designs for the purpose of metals or would be better for pottery. They are high authorities, members of the Academy, and architects of eminence; Mr. MORRIS, for instance, is one. He has also a general knowledge of ornament, and the architects have a general knowledge of what could be done in stone or in brickwork." The Commissioner might well have observed that it was this "general knowledge" which is the bane of the schools. When Mr. MORRIS, who is so prominently put forward to deter objectors, is asked the question, he is far from being so confident about the perfection of the selection. "The competition in which I have been judge," he said, "has been in things which have already received the third-grade prize; whether somebody would be required to be added to the staff of judges for the first examination, I do not know." There are a great many other things in connection with the Department about which it is politic to plead want of knowledge.

If a system of technical education is to be a success, the uncertainty which has been a characteristic of the Department schools must be removed. All knowledge is good in its way, but the need of the present time is that kind which can only be given by specialists. A manager in Messrs. EASTON & ANDERSON'S works would be far less glib of speech than the Department official, whose lecture, as above described, was below contempt; but the gain to the apprentices from an hour's teaching by him would be very different to what it was after hearing the South Kensington man. It is not, however, every manager who has

the faculty of teaching or the inclination to undertake the office, and therein, it must be owned, lies the great difficulty which has presented itself to those who have been asked to suggest improvements in the existing system. On another occasion we shall attempt to express their conclusions.

(To be continued.)

## LANDSCAPE IN ART.—II.\*

ACCORDING to Mr. RUSKIN, the first mountain naturalism is to be found in the background of the *Tribute Money*, by MASACCIO, in the Brancacci Chapel, at Florence, and, so far as Italian art is concerned, Mr. GILBERT agrees in this opinion, although he asks us not to forget what had been done elsewhere by VAN EYCK. The Brancacci picture is fast decaying, but a copy of a photograph in its present state shows plainly that the artist was impressed with the superiority of natural hills over all conventional types of them. Another quality of MASACCIO'S background is that the houses are suggestive of reality, and in scale have some correspondence with the figures. The painter's works have been often described, still attention has been concentrated on the figures, which are surprising examples not only of power but of moderation, and in this as in other cases, Mr. GILBERT throws a new light on the work, when he points out the character of the landscape. KUGLER claims priority for GOZZOLI in the search after fidelity, and BURCKHARDT bestows much praise on the fabulous splendour of his gardens and landscapes and fine woody scenes. But Mr. GILBERT says that atmosphere is absent from the scenes, and that they have none of that unity which MASACCIO introduced. Much more of that painter's spirit is found in the frescoes of GHIRLANDAIO, with the addition of peculiarities which may have been derived from Flemish examples. One of these is the arrangement of the rocks, which probably was derived from the fractured strata in quarries, and another is the round turf knoll which caps every rock. The modern admirers of BOTTICELLI would fain see the perfection of landscape as of figure-work in his paintings, but all that can be said of them is that the backgrounds are rather expressive of that sadness in which young pessimists take delight.

LEONARDO DA VINCI studied landscape not merely with a view to business like an artist, but as a philosopher. Among the miscellaneous observations which are found in the medley called the "Treatise on Painting," are several on this branch of art. The titles of a few will suggest their nature, viz., objects seen at a distance; a town seen through thick air; the green of the country; greens of a bluish cast; the colour of the sea from different aspects; why the same prospect appears larger at some times than others; sunbeams passing through the openings of clouds; the beginning of rain season; climates; dust; how to represent the wind; wildernesses; the horizon seen through water; the shadow of bridges on the surface of water. In the memoranda under those heads we can trace an opposition to the recipes for making landscapes which apparently were then in vogue. LEONARDO was no admirer of cut-and-dried rules in art, and, although of surpassing genius, he was humbled before the infinite variety that is seen in nature. "Whoever flatters himself that he can retain in his memory all the effects of nature is," he says, "deceived, for our memory is not so capacious; therefore consult nature for everything." His remarks are so subtle that it is a pity that some one did not endeavour to obtain a commentary on them from MALLARD TURNER, who alone possessed the power of expressing the mystery of light and movement which fascinated DA VINCI. In everything connected with the artist we find a puzzle, and one is the difference between his theory and practice in landscape painting. The backgrounds in his Louvre pictures do not suggest the observer of nature, and, although Mr. GILBERT speaks of the divine calm which pervades the distant country in the *Cenaculum*, the condition of the picture through the wear and tear of time, the repainting of sacrilegious hands, the vandalism of soldiers, and the carelessness of monks differs so much from what it

\* "Landscape in Art before Claude and Salvator." By Josiah Gilbert. John Murray.

was when LEONARDO ceased to work on it, that we are not justified in speaking of any of its qualities with certainty. Once on looking at the *Vierge aux Rochers* the background recalled to us the description of the Mammoth Cave in Kentucky, in which there is a weird mimicry of above-ground forms that becomes at length oppressive, but can never be forgotten. We were not surprised to find a similar idea in Mr. GILBERT's book when speaking of the picture. "Some stalactite cavern," he writes—"perhaps that of Oliero, near Bassano—must, we suppose, have captivated his shuddering fancy, and so he paints this memorial. Dark obelisks and teeth of rock shoot forth straight from the waters, that chilly, dark wind round their bases, and yield dull green reflections. They are met by a jagged curtain from above, and between the two, fearful gleams of white light penetrate, revealing some sprays of leafage." Very different is the storm scene that is shown in DA VINCI's pen-and-ink drawing which is at Windsor. This is apparently a record of a scene that was witnessed, and it is remarkable that DA VINCI, like TURNER afterwards, assumes a position in which he can look down upon the earth.

It would take too much space to follow Mr. GILBERT as he surveys the progress of landscape art. We must pass to TITIAN, a painter who, happily for mankind, was not troubled by the doubts and fears, disaffection, and remorse which impeded the full display of the powers of DA VINCI and MICHEL ANGELO. One of the best proofs of the naturalness of TITIAN is found in the fact that old-fashioned observers of country scenes, like UVEDALE PRICE, who were free from the cant of criticism, were fascinated by the graciousness of his works. It is only in autumn that we have much variety and richness of colour, and accordingly they supposed that it was from that season the painter drew inspiration. "It has often struck me," says PRICE, "that the whole system of the Venetian colouring, particularly that of GIORGIONE and TITIAN, which has been the great object of admiration, was formed upon the tints of autumn; and that their pictures have thence that golden hue which gives them such a superiority over all others. Their trees, foregrounds, and every part of their landscapes have more strongly than those of any other painters the deep and rich browns of that season. The same general hue prevails in the draperies of their figures, and even in their flesh." So strong a believer was PRICE in the unity which comes from following nature, that he was able to point out the discordance which is now seen in TITIAN's *Ganymede* through the bright blue sky which was painted in it by CARLO MARATTI, making the flesh appear almost black. The opinion of the English country gentleman has been confirmed by critics and painters. TITIAN has been called the HOMER of landscape, and, according to Sir CHARLES EASTLAKE, he painted "the grandest landscapes the world has seen." Mr. GILBERT has already explained the relation between the painter and the mountains of Cadore, and in the present volume he returns to the subject, as may be judged from the following extract:—

It was at Cadore that the companionship of cloud and mountain, which he was the first to dwell upon as a subject for art, would be constantly before him. Think of the round white bags scattered athwart the sky that served for clouds so long, or of the sweet but endlessly-repeated bands of cirro-stratus of more poetical observers, and then turn to the powerful storm-clouds of Titian that roll with might about the mountain tops and are heaped up into the sky. But that Masaccio once, and Bellini once or twice, had hinted at such a conjunction, it would seem as if between Lucretius and Titian no observant eye had witnessed that magnificence. Titian knew well not only that mountains are among the grandest symbols that nature offers of power, mystery, duration, and majesty, but also how much is gained by their fellowship with clouds. To him they were two great landscape powers, and he composed mountain and cloud together, each answering to each, like the parts of a chorus. Well, therefore, may it be said that Titian stands at the head of landscape art. He took a far wider range than had been taken before; he saw, more than any one before, the varied power and expressiveness of scenery, and he treated it all with a rare grandeur—nay, solemnity of feeling. He is never led into the fantastic; he never wearies with a confusion of startling effects, such as we find in Altdorfer, or occasionally, with all his genius, in Tintoret. His feeling for deep harmonious colour and for breadth of chiaro-oscuro (greatly indebted in both respects to Giorgione) is shown as much in his landscape

as in his figure subjects; and there is as much of dignity, whatever the scale, in his tints of scenery as in the portraits of princes, senators, or soldiers, with which they are so often associated.

Mr. RUSKIN believes that TINTORET is a greater master of landscape than TITIAN, but in that opinion Mr. GILBERT does not agree. In TINTORET's grandeur, he says, it is rare to find calmness; he has no sublime simplicity, no still and golden glow. But in a subject of this kind it is difficult to decide, and perhaps it would be wiser if no comparisons were instituted between artists whose merit was that each endeavoured to express his own nature.

Mr. GILBERT's admiration for the great Venetians does not prevent him doing justice to artists of other schools. He speaks well of RUBENS' magnificent sketching, which is so suggestive of the highest possibilities, and says truly that "he was more sensitive to the poetic side of nature than his pictures of proud pageantry would lead one to expect." It is remarkable that, in spite of the esteem in which RUBENS was held among English connoisseurs, his works have had little influence on English landscape art. REYNOLDS, who was an admirer of RUBENS, says that his landscapes, like those of the Dutch school, are transcripts of particular scenes, which he heightened by introducing a rainbow, a storm, or some accidental effect. CLAUDE, on the other hand, adopted the principle of figure painters, and composed his pictures out of parts of a great many beautiful scenes, and he was averse to the use of accidents. But this manner was productive of surprising results, and Mr. GILBERT expresses what has been generally felt when he says that it was CLAUDE who has made the Italy that, since his time, has filled the imagination of travellers and poets. TURNER, who was ambitious to measure himself against CLAUDE, was aware of this, and his *Modern Italy* is an attempt to supplant the influence of the man he considered his rival in creating an ideal Italy, which no amount of travel will exactly realise. It is with TURNER's name that Mr. GILBERT concludes his book on landscape, just as REYNOLDS wished to close his discourses with MICHEL ANGELO, and after his survey of the history of the art, from the earliest times, he has decided that among all the artists TURNER was the greatest. Here are the reasons for his judgment:—

In the first place, Turner took possession of the world of atmosphere. All the skyey vault to its uttermost recesses, its openings into the heart of heaven, its infinite gradations both of light and colour, the tender veilings of cloud, and their wind-borne masses—all the region of the air and the glory of it—was his, as none had ever possessed it before. Distance with its unsearchableness, its innumerable tints and faint suggestions—distance with its ineffable charm—was rendered by him as by none other. All the witchery of water, on stream or river, lake or ocean, was at his command. He knew how to avail himself of the utmost grace of form to be found in hill, mountain, and tree, and with unparalleled skill could work all these materials into one complex but exquisitely perfect scene. Well, too, did he understand how to link the spectacle of nature with the story of human life; man is there, not as a mere ornament or adjunct, but as the keynote of his subject. . . . There are, we may admit, many and grievous inequalities, deficiencies, faults, in Turner's work; but he has grasped the master key, and whosoever would penetrate by the way of pictorial art into the shrine of nature's symbolism, must take that key and enter by this door.

We commend Mr. GILBERT's volume to the attention of our readers, both artists and amateurs. It fills a void in art literature, and from the general spirit in which the subject is treated, a reader will find the book as delightful as it is instructive.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE eighth ordinary meeting of the Institute was held on Monday evening, Mr. Alfred Waterhouse, A.R.A., in the chair.

Mr. ALEXANDER PAYNE announced the death of Mr. John Middleton, of Cheltenham, who, while away in Wales, had been stricken with paralysis, and died on Friday, the 13th inst. Mr. Middleton had been in practice for thirty years as an architect, and for a while at Darlington. He then spent some years in travelling abroad, and afterwards repaired to Cheltenham, but without any idea of practising there. He, however, prepared plans gratuitously for the church of All Saints, and had resided there and practised ever since.

The Chairman said they would all lament to hear of the death of Mr. Middleton, and were much obliged for the short memoir read by Mr. Payne.

A paper was then read by Mr. RALPH NEVILL, F.S.A., on

#### Roof Coverings.

Mr. NEVILL, after stating that it was difficult to obtain from the older members of the profession who were in full work long and exhaustive papers on any subject, expressed his conviction that considerable benefit would result from the discussion of subjects of practical interest introduced in short papers requiring little preparation. He could not attempt to deal exhaustively with so large a subject as roof coverings, so he would confine himself to what he could speak of from practical experience. Nearly all roofs in rural districts were constructed either of tiles or slates, the former being superior from the point of view of picturesqueness and non-conductiveness of heat, the latter from that of cheapness and lightness, and especially closeness of fit. One objection to tiles was the impossibility of getting them to lie quite close. In the great snow-storm of 1831 the snow, in the form of a dry snow dust, was driven before a strong wind, and he supposed there was not a single tiled roof that the snow did not penetrate, and this occurred also with felted roofs. The outcry consequent on this had been so great that he had endeavoured to find some easy method of meeting the difficulty, and what he had to say that night was the upshot of his considerations. He then pointed out the objections of the old traditional mode of laying tiles. This was by use of pins of wood, willow or hazel, oak as most durable, or deal as most accessible. These were succeeded by cast-iron pins nailed into the laths. They split the laths, so that in stripping a roof the whole structural connection might be found no longer to exist. Bedding tiles on hay—one of the oldest and commonest plans—was most objectionable, and there were also serious drawbacks to bedding in mortar. The various modes of laying felt under tiles were next described, and the objection to its use noted—namely, its habit to stretch, the likelihood of its causing the rafters to rot, and its short durability. Mr. Nevill then described the plan suggested by himself. He advocated covering the backs of the rafters with an inch of concrete or plaster, in which the pins for the tiles were fixed, the plaster being laid on the laths in the ordinary way, 3-inch rose nails being first driven into the backs of the rafters standing out one inch, care being taken to keep the nails out of the line of the tile-pins; the plaster or concrete to be made of selenitic lime mixed with coke breeze and sand, as it was essential that it should set quickly. It should be trowelled to a smooth hard face. Before the plaster had quite set, the tiles should be laid, the pins being pressed into the plaster. It was important that the pins should not be more than 1½ inches long. Should the plaster further become too hard, the pins must be driven in with a hammer. The eaves lath should be 1½ inches thicker than usual, in order to stop the plaster. The valleys should be carefully trowelled, and the hips would require a raised roll. No practical difficulty occurred in the case of chimney-stacks. It would be apparent from this description that there would be a coating of concrete all over the roof, which would throw off any damp that might penetrate through the tiles, and would make the rooms underneath much more equable in temperature. Specimens of concrete plaster that had been used were exhibited. The advantage of such a roof in preventing the spread of fire was pointed out. Objections might be raised on the score of the increased weight of the roof covering, but Mr. Nevill said he had not found it necessary to increase the scantling of the roof timbers. It might also be thought that the timbers would decay for want of ventilation, but hitherto no signs of decay had appeared in roofs so treated. The cost, as a rule, would not be more than 15s. per square above ordinary tiling, and several tables of comparison had been prepared. Mr. Nevill concluded by referring to the advantages this system of laying tiles possessed, and as being likely to prove extremely useful for the employment of the large tiles now coming into use, such as pantiles, Phillips's, &c.

Mr. W. G. COLDWELL also read a short paper. He said that about a fortnight after the earthquake in Essex, on April 22 last, motives of curiosity had led him to visit the district, and, after an inspection of an area of over 40 miles square, he had been profoundly impressed with the want of security of the plain tile roofing. The tile roofs had come down almost *en masse*, and it was evidently most desirable to adopt some system of laying tiles different from that now in vogue. With reference to lead, no more important subject could be suggested for discussion than the deterioration in the quality of lead now supplied. About fifteen years ago some trifling repairs were needed in an important building. It had an open timber roof with oak boarding internally, and fir boarding to receive the lead. On examination, it was found that on the underside of the lead, a film of white powder existed in lines corresponding with the joints of the boarding, thus indicating that injurious

action had taken place from below. This on being submitted to a chemist, Dr. Frankland, was declared to be white lead, and Dr. Frankland's report was a most important and comprehensive one on modern lead. The lead was found to contain the least amount of silver, and it was probable that the modern resilvering process really rendered the lead more liable to injury from acid vapours than the process which did not remove so much silver from the ore. Mr. Coldwell also alluded to various methods of covering iron roofs.

Mr. McLACHLAN next read a paper descriptive of roofing materials as employed in North Germany—namely, tiles (plain and ornamental), slates, copper, zinc, paper, wood-cement (*Dachpappe*), &c. Examples of tiled roofs were mentioned, and the good effect of these roofs with dormer windows, what would be called batswing dormers, noted. Slates had been introduced during the last fifty years, and in the towns he visited he had failed to see any old example of a slated roof. Buildings at Hamburg (parts of the Courts of Justice) and at Berlin (the Central Cattle Market and Polytechnic) were roofed with Welsh slates in the English manner. He had met with no instance of a lead roof covering, and had been told that its use had been superseded. Roofing paper answered where great economy was required, as also for temporary purposes. The paper was impregnated with coal-tar, from which the oil had not been extracted, and covered with powdered chalk. Care was necessary in fixing it, and the roof pitch must not be too steep, or the rain would wash out the oil. Every two years the coat of coal-tar must be renewed. Wood-cement was one of the most important roofing materials, and had become a great favourite during the last twenty years. The name wood-cement was a misnomer. A general description of this roofing material was then given, though certain elements in the manufacture were said to be a secret. Turf was a good thing to finish off the roof with, as it prevented disturbance to the loose gravel placed on the top.

Mr. SLATER said he had had some experience in England of the wood-cement roof, which had been used in a brewery, constructed now three years. It had answered, at least the material had up to the present served its purpose well, and was a good non-conductor of heat. He had not heard turf recommended before, but there was no doubt the gravel did wash out with the rain, &c. He wished Mr. Nevill had had a longer experience of the roof he had described. There could be no doubt it was heavier than a tile or slate covering, and if an ordinary roof would bear the weight, it would seem that they had been in the habit hitherto of making ordinary roofs unnecessarily substantial. As roofs moved, it would be interesting to know the effect of movement on such a roof, and whether the plaster would split. Mr. Slater spoke of slightly vitrified tiles as better adapted to keep out the weather than the non-vitrified tiles, but he considered the increased cost of them would prevent their being adopted here. The upper edge of the exposed portion of the tiles might, however, be chamfered off instead of standing up from the roof, and this would diminish the chance of their being stripped off the roof. He thought the question of wind pressure on roofs was one not sufficiently understood, and one interesting enough for an evening's discussion by itself.

Mr. W. H. WHITE said that no reference had been made to the French plan of using copper hooks instead of nails for fastening tiles or slates. The wind blowing under them merely rattled them, without doing them any injury. M. Viollet le Duc was, he believed, the first to introduce the use of the copper hooks. He himself had used them with advantage at Cherbourg, where he had seen all the trees in a wood blown down and the greater part of the roof of a château, where the slates were nailed, destroyed. In company with Professor Roger Smith, he had seen a deposit of half an inch of the greyish powder spoken of by Mr. Coldwell when the lead was being taken off the dome of the Invalides in Paris. Viollet le Duc had been induced to use lead alone, having found that the oak decayed and gradually dropped away, till nothing but the lead was left. He also found that deal was not affected in this way like oak.

Mr. PALEY, of Lancaster, spoke of a letter received from a client making inquiries as to a certain fluffy stuff under the slates of his house. The building had had a narrow escape of being burnt down. Having examined the stuff, he found it was felt. A chimney had caught fire, and sparks had blown under the slates and caught the felt, which had become unravelled, and you could scarcely tell what it did look like, but it was strongly impregnated with tar. He must never, he thought, use that again. Mr. Nevill's paper bearing on the use of cement was important, and seemed to point in the right direction. His experience in regard to slating was, however, that if properly fastened by copper nails to good battens and properly pointed it was perfectly impervious to snow, and would last nearly for ever, and so far was the best roof covering that could be had.

Mr. BRODIE asked for information as regarded the item of repairs.

Mr. A. PAYNE said he should perhaps best consult the interests of the meeting by not reading the paper he had prepared as the hour was getting late, but would refer, in short, to the points he thought of interest. His paper on "Concrete Roofs and Roof Coverings" briefly recapitulated statements he had already made on the subject in that room. The employment of concrete, he considered, would be advantageous for flat roofs, for all kinds of fireproof roofs, domes and vaults, and roofs of buildings of a monumental character in which great strength or durability were required. As an example of flat roofs, Mr. Payne made mention of one that had come under his notice as district surveyor for Hackney, where Mr. H. M. Millar, builder, was erecting some small houses in which several ingenious applications of concrete were adopted. Part of the flat roofs were formed as follows: the top storey was covered by joists, 8 inches by 3 inches at one end, and 3 inches by 3 inches at the other, made by cutting through a 11-inch by 3-inch joist diagonally, so as to get fall without waste, placed about 12 inches apart. These were covered by boarding in 2½-inch widths, and ¾-inch thick, each board being 1¼ inches distant from the next one, an important point, because, if laid close, they would swell, spring up, and break the roof. On this, as centreing, was added 2 inches of Portland cement concrete as a roof covering. The concrete was made of brick rubbish ground to powder, with Portland cement added, thoroughly mixed dry, then wetted and brought to the consistency of a thick paste. It was laid on the boarding, smoothed over with a trowel, and the roof was complete. A coat of tar was sometimes added, but was not absolutely necessary. Mr. Millar claimed to have had eight years' experience with such roofs, had made about fifty, and never had a failure but in the case of some done during a frost. More frequently the centreing boards were put under the joists, embedding them, and so making the roofs practically fireproof. In buildings of greater importance, the same system might be adopted with iron joists instead of wood.

Mr. BLASHILL said he preferred good and large fillets to flashings, where the roof came against a wall. With the most carefully put-up flashings he had found water got in.

Mr. MACVICAR ANDERSON recommended the cutting of a small chase in the brickwork of the wall the roof came in contact with, and so let the ends of the tiles into the wall, making good afterwards with cement. This was better than fillets or flashings, which he looked on as an abomination.

Mr. NEVILL said that though his roof did appear terribly heavy, he had tested it in many cases, and never found any sign of sagging or difficulty. Anything wrong, he thought, would have shown itself in two years. There was no difficulty as to repairs beyond what was common to any other roof. He had claimed the advantage for slates over tiles for keeping out snow.

A vote of thanks having been passed to Mr. Nevill, the proceedings terminated.

## TESSERÆ.

Canova's Church.

M. VALERY.

ABOUT four miles from Asolo, on a small elevation at the bottom of a valley commanded by a triple range of mountains, is the temple raised by Canova, near Possagno, a village containing fourteen hundred inhabitants, where he was born. Marble is common in these mountains, and one would say that it was to give it animation that this great artist entered the world at their foot. Part of the riches of Possagno consists in the abundance of a stone precious by its quality and by the diversity of uses to which it is applicable. Canova's family was engaged in the working of this quarry. The apparition of this pompous monument of art in the bosom of savage nature, in the midst of woods and rocks is marvellous. The portico, composed of eight fluted columns of the ancient Doric order, is similar to that of the Parthenon, the vestibule to that of the temple of Theseus, the cupola resembles that of the Rotunda, and, as in all the temples of antiquity, the light only enters by the doors and the roof, which has an opening of sixteen feet in diameter. This church, dedicated to the Trinity, was built from designs of the Venetian architect Selva, but which were in several instances corrected and changed by Canova. Through an absurd and very ancient custom at Possagno, females alone have the privilege of entering the church by the great door. This portico of the Parthenon is thus devoted to the particular use of the female peasants, and it has been necessary to open two side doors for the men. The church, begun in 1819, was not finished till 1830, and not brought into use for divine service until 1832. The death of Canova, which happened in 1822, must have contributed to these delays. His heirs have been accused of evincing indifference towards the completion of a monument which would prodigiously decrease the amount of their inheritance; but it appears that the charge,

is unfounded, and that the work from some details in the construction could not proceed more rapidly. Such was the benevolence of Canova, and such the noble use he always made of his riches, that, when at the close of his life he wished to construct the church of Possagno, his resources were found to be insufficient, and he was obliged to resume the most profitable of his labours, and with the same fatigue to which indigence alone had first condemned him. The expense of the building has been a million francs, and the interest of a capital of 113,437 frs. 66 c. is set apart for repairs. The interior of the building has an air of simplicity, rather harsh and naked, Canova not having been able to execute some works with which he had intended to decorate it.

## A Roman Palace.

N. HAWTHORNE.

The courtyard and staircase of a palace built three hundred years ago are a peculiar feature of modern Rome, and interest the stranger more than many things of which he has heard loftier descriptions. You pass through the grand breadth and height of a squalid entrance-way, and perhaps see a range of dusky pillars, forming a sort of cloister round the court, and in the intervals from pillar to pillar are strewn fragments of antique statues, headless and legless torsos, and busts that have invariably lost—what it might be well if living men could lay aside in that unfragrant atmosphere—the nose. Bas-reliefs, the spoil of some far older palace, are set in the surrounding walls, every stone of which has been ravished from the Coliseum or any other Imperial ruin which earlier barbarism has not already levelled with the earth. Between two of the pillars, moreover, stands an old sarcophagus without its lid, and with all its more prominently projecting sculptures broken off; perhaps it once held famous dust, and the bony framework of some historic man, although now only a receptacle for the rubbish of the courtyard and a half-worn broom. In the centre of the court, under the blue Italian sky, and with the hundred windows of the vast palace gazing down upon it from four sides, appears a fountain. It brims over from one stone basin to another, or gushes from a Naiad's urn, or spirts its many little jets from the mouths of nameless monsters, which were merely grotesque and artificial when Bernini, or whoever was their unnatural father, first produced them; but now the patches of moss, the tufts of grass, the trailing maidenhair, and all sorts of verdant weeds that thrive in the cracks and crevices of moist marble, tell us that nature takes the fountain back into her great heart, and cherishes it as kindly as if it were a woodland spring. And, hark! the pleasant murmur, the gurgle, the plash. You might hear just those tinkling sounds from any tiny waterfall in the forest, though here they gain a delicious pathos from the stately echoes that reverberate their natural language. So the fountain is not altogether glad after all its three centuries of play. In one of the angles of the courtyard a pillared doorway gives access to the staircase, with its spacious breadth of low marble steps, up which in former times have gone the princes and cardinals of the great Roman family who built this palace.

## The "Apollo Belvedere."

JOHN FLAXMAN, R.A.

There are many reasons for the belief that the *Apollo Belvedere* is only a copy. The general appearance of the hair and the mantle are in the style more of bronze than of marble; and it is mentioned in the work on the Pope's Museum (Pio Clementino), by the Chevalier Visconti, who illustrated that museum, that there was a statue in Athens, I do not know whether it was in the city or some particular temple, an *Apollo Alexicacus*, a driver away of evil, in bronze by Calamis, which had been erected on account of a plague that had been in Athens. From the representations of this statue in basso-relievos, and with a bow, it is believed that the statue might be a copy of that. One reason I have given is, that the execution of the hair and cloak resembles bronze. But another thing convinces me of its being a copy. I had a conversation with Visconti and Canova on the spot, and my particular reason is this. A cloak hangs over the left arm, which in bronze it was easy to execute, so that the folds on one side should answer to the folds on the other. The cloak is single, and therefore it is requisite that the folds on one side should answer to the folds on the other. There is no duplication of drapery. In bronze that was easy to execute, but in marble it was not, therefore, I presume, the copyist preferred copying the folds in front, but the folds did not answer to each other on one side and the other; those on the back appear to have been calculated for strength in the marble, and those in front to represent the bronze from which I apprehend they were copied. There is another reason. The most celebrated figure of antiquity is mentioned by Pliny, viz. the *Venus of Cnidus*, by Praxiteles. He mentions it in a remarkable manner, for he says that the works of Praxiteles, in the

Ceramicus, not only excel those of all other sculptors, but his own elsewhere, and this *Venus* excels all that he ever did. Now it seems inconceivable that so fine a statue as the *Apollo* could have been executed without its name being brought down to us, either by Pliny or Pausanias, if it had been esteemed the first statue in the world.

#### Gothic Ornament and Natural Forms.

G. E. STREET, R.A.

Natural forms cannot be exactly imitated in architectural construction; they are too slight and supple, and, moreover, for their full development, they require the addition of natural colour, a consummation which has even been attempted on some modern realistic ironwork, with (as it seems to me) the most contemptible result. It has been well said that the best natural work is really only a *noble abstraction* of natural form. This is accomplished by taking, first, the essential elements of the thing to be represented, then the rest in the order of their importance, and using any expedient to impress what we want upon the mind without caring about the mere literal accuracy of the expedient. Suppose, for instance, a peacock has to be represented, the whole spirit and power of the bird are in the eyes in its tail. Express them, and you have done all that you can require. And so in an old marble inlay in a Venetian palace, we see a peacock with expanded tail, the eyes of which are marked by spots of colour, and the outline of the feathers by lines so conventional in design that one could hardly at first believe it would produce the desired effect: yet, in truth, the effect is distinct and admirable, far more so than any more close imitation of nature would have been. The direct imitation of natural forms was occasionally attempted in early work, but always under the severest conditions, simply as ornament, never when work was to be done or weights carried. There the architect always felt it to be wiser to recur to conventional treatment of nature.

#### Théodore Rousseau's Landscape Art.

L. LETRONNE.

On looking over a study of mine, he observed that a rough sketch need not largely partake of the special nature of a study, the object of which is to lead to a certain amount of facility with the brush—which facility, indeed, would come soon enough. I promised to finish more carefully. "As to that word 'finish,'" he said, "what finishes a picture is not the quantity of details put into it, but the truth or completeness of the final result. A picture is not bounded only by its frame. No matter what its subject may be, it is sure to have one principal object upon which your eyes will rest, all others which it contains being merely its complement. These others interest you comparatively but little. After the one chief object, there is nothing to catch your eye. Here, then, you see the real limit of the picture. This principal object or figure should be made to have the same powerful effect upon everyone who looks at your work. You must, therefore, return to it continually, and strengthen its colour in every possible way." He enumerated a few works of the great masters which bear out this theory. He particularly mentioned Rembrandt, who comprehended it more clearly than any other painter. "But, on the other hand," he added, "if your picture contain the most exquisite details, spread over the whole breadth of the canvas, people will look at it with indifference. It will be all equally interesting—or, rather, it will all be without interest. It will have no real limits; it might be prolonged indefinitely in any direction without affecting its character. You will never come to the end of it, so you will never finish it. A picture is finished when the effect of its *ensemble* is complete. Barye's magnificent lion at the Tuileries has every hair of its mane in greater perfection, in reality, than if the sculptor had laboriously carved them one by one."

#### Suggestions for Construction from Nature.

PROFESSOR COCKERELL, R.A.

Sir Christopher Wren reflected that the hollow spire which he had seen or built in so many varieties was, after all, but an infirm structure, and he sought that model which should enable him to impart to it the utmost solidity and duration. Simple was the original from which he adopted his idea. He found that the delicate shell called *turretella*, though extremely long and liable to fracture from its base to its apex by the action of the water amidst the rocks, was rendered impregnable by the central column, or newel, round which the spiral turned. Therefore, in his spire of St. Bride's, he establishes the *columella* in the centre, round which he forms a spiral staircase to the top issuing on stages of arched apertures, thus giving us (if not the most beautiful) certainly the most remarkable and enduring spire hitherto erected. When Brunelleschi was charged with the erection of the dome of Sta. Maria, at Florence, of nearly equal diameter with that of the Pantheon, but at more than twice its height from the pavement upon a base raised on piers, and by no means of the strength and

cohesion of the original model—the Pantheon—it was apparent that in giving it the same solidity, the weight would be insupportable on such a foundation. How was this object to be accomplished? Brunelleschi reflected that the bones of animals, especially of birds, possessed solidity without weight, by the double crust or hollow within. But, above all, he remarked that the dome which completes the architecture of the human form divine was constructed with a double plate connected by the light and fibrous but firm walls of the hollow *cancelli*, so that strength and lightness were combined in the utmost degree. Brunelleschi followed this model in his dome of Sta. Maria, and the traveller now ascends to the lantern between the two crusts of plates forming the inner and the outer domes. Michel Angelo adopted this contrivance in the dome of St. Peter's, and almost all the subsequent domes are upon the same idea.

#### Beauty and Utility.

PROFESSOR G. WILSON.

It is astonishing how many people think a thing cannot be beautiful if it is cheap, or comfortable if it is beautiful. They tell you the price of a carpet, as if its cost were the measure of its beauty, and then nail over it an ugly crumb-cloth, to save themselves the pain of walking upon it. The only human vocation in which we universally agree that beauty and utility shall never be separated is that of the soldier. But is not this passing strange? Your warrior shall fight in a graceful dress, ride a finely-caparisoned horse, kill his enemy with a handsome sword, and save his skull from being cleft by a splendid helmet. But in all the arts of peace we treat Beauty as if she were a lazy fairy who would take no part in useful work. This is truly atheistic and diabolic doctrine; for if there be one truth which the Author of all has taught us in His works more clearly than another, it is the perfect compatibility of the highest utility with the greatest beauty and with the greatest simplicity of material.

#### The Nelson Column, Trafalgar Square.

SIR F. CHANTREY, R.A.

I do not mean to say that a column is not a fine thing: in itself it is a very fine thing; the taste of ages has proved that it is so, and any man would be a fool who attempted to deny it. But is it a thing suited to your purpose? Now, what is your purpose? To perpetuate the memory of a great man. Then durability is the quality you should look for. Those gimcrack things you say you have been to see of stone and metal combined, will never stand; the stone and metal will never hold together. Make a column as solid as you will, make it of blocks of stone piled like Dutch cheeses upon one another, still the stone will crumble, and vegetation will take place in the joints. Besides, columns have got vulgarised in this country. The steam chimneys in every smoky manufacturing town supply you with columns by the dozen. In a country like Egypt it is quite a different thing. A column or an obelisk is a fine object there; with a flat all round you, as far as your eye can reach, you are glad of anything to break the uniformity of the long straight line that joins the earth to the sky, and you can see them fifty miles off; but huddled in such a town as London, a column will be lost. It will give you a crick in your neck to look up at it.

#### Improvements in Greenhouses.

SIR J. PAXTON.

In 1828 the various forcing-houses at Chatsworth were formed of coarse, thick glass, and heavy woodwork, which rendered the roofs dark and gloomy. My first object was to remove this evil. I lightened the rafters and sashbars by bevelling off their sides. I also contrived a light sashbar, having a groove for the reception of the glass; this groove prevented the displacement of the putty by the sun, frost, and rain. In the construction of glass-houses requiring much light there appeared this objection:—In plain, lean-to roofs, the morning and evening sun, which is of the greatest importance to forcing fruits, presented its direct rays at a low angle, and consequently very obliquely to the glass. At those periods most of the rays of light and heat were obstructed by the position of the glass and heavy rafters. This led me to the adoption of the ridge and furrow principle, which places the glass in such a position that the rays of light in the mornings and evenings enter the house without obstruction, and present themselves more perpendicularly to the glass when the least powerful, and more obliquely when most powerful. In 1834 I resolved to try a further experiment on the ridge and furrow principle, in the construction of a greenhouse of considerable dimensions, which answers admirably. I made a still lighter sash-bar than any previously used, on which account the house (although possessing all the advantages of wood) was as light as if constructed of metal. The house presents a neat and light appearance, and while it makes an admirable greenhouse, is also an economical building, for, notwithstanding the heavy tax on glass (since removed) it only cost at the rate of 2d. and a fraction per cubic foot.

## NOTES AND COMMENTS.

A BLACK and White Exhibition is to be held in Paris from March 15 to April 15, under the presidency of M. EUGÈNE GUILLAUME. It will comprise drawings with crayon, pen, and charcoal, etchings, mezzotints, drawings on wood, lithography, &c. Each artist is to have the right to send two drawings. The prizes will be one gold medal, six silver medals, three bronze medals, and five diplomas. The jury of admission contains well-known artists, in whom proposing exhibitors can have confidence.

THE Lords of the Treasury have sent a collection of the works which have appeared under the direction of the Master of the Rolls to the Mitchell Library in Glasgow. There are over two hundred volumes, including the Domestic Series from the reign of EDWARD VI. to that of CHARLES II., the Home Office Papers, Scottish, Irish, and Colonial Papers. Then there are the documents relating to the reign of HENRY VIII., which the late Mr. BREWER edited with so much care; the valuable Venetian Papers, which Mr. RAWDON BROWN deciphered; and the Carew Papers from Lambeth. Lastly are the Mediæval Chronicles and Memorials. In many libraries books of the kind might be relegated to "the dust and silence of the upper shelf," if one could be found of sufficient dimensions; but the Mitchell Library in the daytime and evening is attended by readers who are able to grapple with the driest Blue-books, and they will find pleasure in the new additions to the valuable library which the rich merchants of Glasgow permit to be so badly housed. The Treasury are apparently in a liberal mood, and the Council of the Institute of Architects ought to seek for a selection at least of the Record Office publications.

PRINCE BISMARCK appears to be indifferent to national considerations when he is in search of what tradespeople call a good article. A turbine was lately required to be erected on his estate at Varzin, but, after a competition, the contract was entrusted to a Zurich firm. In consequence, there is much dissatisfaction among the advocates of a protection of indigenous industry in Prussia.

THE subjects of the two pictures by Mr. LONG, R.A., which have just been added to the gallery in Bond Street where the artist's *Anno Domini* is exhibited have been well chosen. They illustrate the legend that ZEUXIS was allowed to select five young women, each of them being distinguished for some particular beauty, to serve as models for his figure of HELEN. In one picture there is the competitive examination, and the contrast is exhibited between the satisfaction of those who are selected and the disappointment of the remainder. The companion picture shows the artist at work. The figures of the girls are posed in somewhat statuesque attitudes, but, under the circumstances, that cannot be considered a defect. The colouring is bright and pleasing. The introduction of a black lyre in the hand of one of the girls interferes with the general effect, and most of the archaeological details belong to a later period than the time of ZEUXIS. The pictures are hardly equal in execution to the *Marriage Market* and others of the artist's works, but they are excellent exhibition works, and sightseers cannot fail to appreciate them.

ST. VALENTINE'S DAY has been celebrated by Sir EDMUND BECKETT in inditing an affectionate epistle on the misdeeds of architects. This time the grievance is the adoption of a solution of arsenic as a preservative against dry rot in a church. The offending architect who prescribed it was so anxious that no harm should arise to the labourer who handled the watering-pot containing the fluid, that he warned the contractor to use gloves and a veil. It might be assumed that an architect who had displayed this care was not likely to do anything which would bring danger upon the congregation. But Sir EDMUND assumes that, not only in that case, but generally, church-goers are to enjoy "the flavour of arsenical floors." We must say that, although we believe a fluid in which arsenic was an ingredient would not be more dangerous than a sheep-dipping mixture has been to farmers (for the two are allied

in composition), there is no reason why such a fluid should be considered more efficacious than others which are altogether innocuous. The remedies against dry rot are so numerous, ranging from corrosive sublimate to common salt, there is not much difficulty in finding one as useful and more simple than the contents of the arsenical watering-pot.

THE Society of Arts appears to have ceased placing tablets on the houses which have been occupied by distinguished people in London. The owners and occupants were not always pleased with the attention which was given to their premises by hordes of wandering sightseers. In Paris there is a society which erects similar records, and three tablets are about to be placed. One is to be on the house No. 6 Rue de Furstemberg, occupied by EUGÈNE DELACROIX the painter, the second is for the house of MIGNET the historian in the Rue d'Aumale, and the third is for DIDEROT's house in the Rue de Richelieu.

MR. WATERHOUSE selected eight out of the ninety-four designs submitted in the competition for the Newbury District Hospital. They were by the following architects, viz.:—MESSRS. BEAZLEY & BURROWS, E. W. MOUNTFORD, NEWMAN & NEWMAN, J. B. PHILLIPS, H. G. TURNER, TAYLOR & GORDON, WEBB & TUBBS, and W. H. WOODROFFE. Eventually Mr. WATERHOUSE decided in favour of Mr. H. G. TURNER's design, and the Trustees, acting on this advice, have determined to adopt Mr. TURNER's plans, and employ him as their architect.

LORD BROUGHAM, among other feats, is to be credited with the creation of Cannes, and the keepers of hotels and lodging-houses have recognised their debt by erecting a statue of his lordship. Twenty years since, when the place had become known, it was possible to buy land in good positions at from 2½ frs. to 3 frs. a mètre. The price has increased tenfold. The speculative builder and land-jobber have found their way to Cannes, and, according to a recent letter from the place, "they have been running up villas by the score; they have been hacking hills and ravines about in the most objectionable manner; they have been outraging nature with tame "landscape gardening" by line and rule, as witness the defacement of the slopes below Cannes; they have been mercilessly hewing down the olives, although, happily, they have been sparing the firs; and they still hold a quantity of land hanging over the market." This is grievous to read about; but it must be owned that the majority of visitors readily pardon eccentricities of architecture in a health resort where vegetation is luxuriant and the society select.

THE position which SHAKESPEARE occupies in universal literature is suggested by the number of editions of his works which have been collected in the Free Library at Birmingham. At the end of 1884 it contained 6,734 volumes. Of these volumes, the English, including 228 editions of the complete works of SHAKESPEARE, formed 3,877 volumes, the German 1,847, French 492, Italian 147, Russian 62, Dutch 85, Hungarian 45, Spanish 31, Swedish 33, Danish 29, Polish 22, Bohemian 20, Greek 14, Finnic 7, Icelandic 5, Portuguese 5, Croatian 2, Frisian 2, Hebrew 2, Latin 2, Flemish 1, Roumanian 1, Roumelian 1, Ukraine 1, Wallachian 1, and Welsh 1. The library possesses a copy of the folio of 1623, a few of the original quartos, and the splendid series of hand-facsimile copies by Mr. ASHBEE, which Dr. HALLIWELL PHILLIPS issued in forty-eight volumes, and in so limited an issue that probably not twenty complete sets are now to be found.

THE new Edinburgh Dean of Guild has commenced his duties by calling attention to the restricted powers he possesses in respect of sanitary affairs. According to Mr. GOWANS, the building trade in Edinburgh labours under the disadvantage of having to prepare plans for the Court without knowing exactly what the requirements of the Court are, and he therefore proposed that a statement pointing out what was absolutely necessary in regard to drains and sanitary conveniences should be prepared by the committee and sent to the Dean of Guild Court as a recommendation. This sanitary guide is at present under the consideration of a committee.

## ILLUSTRATIONS.

I. ANTICIPATION. II. AN ITALIAN GIRL.

THE figure subjects in the present number are from paintings by Mr. WALTER BLACKMAN, one of the American artists resident in Paris, and who has made a mark there by paintings of heads of the character of the *Italian Girl*. The other illustration is a successful work in a different field.

ADDITIONS TO OLD PALACE, MAYFIELD, SUSSEX.

THE old palace at Mayfield is an historical old place. It was formerly one of the palaces of the Archbishops of Canterbury. Some twenty years ago it was bought by the late Duchess of LEEDS, and was then restored by the late Mr. E. WELBY PUGIN, and converted into a convent and school for the "Sisters of the Holy Child." The old banquetting-hall is now the chapel of the convent. The additions which are now being made comprise the cloisters, nuns' refectory, kitchen, dairy, &c. The material used in the construction is the local stone, with Bath stone dressings. The roofs are tiled. Messrs. L. & H. ROBERTS, of Islington, are the contractors for this portion of the work. The old gatehouse has recently been restored by Mr. E. T. HURBON, contractor, of Tunbridge Wells. The architects are Messrs. PUGIN & PUGIN, of 111 Victoria Street, Westminster, and 19 Surrey Street, Strand.

ENNERDALE, SUTTON, SURREY

THIS house is situated on the high part of the chalk district, and commands extensive views. The materials used are CHUTER'S red bricks, Ockley tiles for the vertical tile-hanging, and Broseley tiles for the roof. The hall and passages are paved with DIESPEKER'S mosaic paving. The work has been carried out by Mr. J. B. POTTER, of High Street, Sutton, from the designs of Mr. HERBERT D. APPLETON, A.R.I.B.A.

LLANSAINTFREAD CHURCH.

A CHURCH existed at Llansaintfread, which is within seven miles of Brecon, for many years, and in 1690 one was rebuilt there. But after two centuries it fell into a state that might be called ruinous, and Mr. GWYNNE-HOLFORD, whose family has been long connected with the place, resolved to erect a new building. Plans were accordingly prepared by Mr. STEPHEN W. WILLIAMS, architect and county surveyor, of Rhayader, and the foundation-stone of the new building was laid by Mr. GWYNNE-HOLFORD, on December 2, 1884. The new church, which is cruciform on plan, comprises nave and chancel, with north and south transepts, entrance porch at south-west angle of nave, octagonal bell turret giving porch to vestry, with ringing chamber over. The vestry and organ chamber will be situated in the south transept, and the north transept is intended to replace the Buckland Chapel, which stood on the north side of the chancel in the old church, and which contained the family monuments of the Buckland family. The style adopted for the new church is transitional Early English of the thirteenth century. The nave windows are simple lancets cusped; the west window of four lights of rich geometrical tracing; the east window, which is to be glazed with stained glass, is of three lights, and transept windows of two lights; all of these traceried in character with the west windows. The roofs of nave, transepts and chancel will be of pitch pine, the former hammer-beamed roofs, the principals springing from carved brackets of Beer stone. The chancel roof will be panelled and moulded with carved bosses at the intersections of the moulded ribs. The seating of the church, the pulpit, and reading-desk also to be of pitch pine, the warming apparatus one of PORRITT'S underground stoves. The floor will be laid with encaustic tiles, and under the seats with patent wood-block flooring. The interior of the church will be lined with red Grinshill stone with a cavity between the inner and outer walls, which are built of the native stone from a quarry of Mr. GWYNNE-HOLFORD'S near the site; and all external dressings are to be of red Alvely stone from Worcestershire. The roofs will be covered with stone tiles from the Bargoed quarries.

The contractors are Messrs. EDWARD DAVIES & SON, of Newtown, Montgomeryshire.

## THE LIVERPOOL CATHEDRAL.

THE following is an extract from a letter of Mr. William Morris, respecting the site for the proposed cathedral in Liverpool:—

As to the site of the new building, it is really difficult for me, who do not know Liverpool, to say. A good architect may make a bad site a good one. Still I admit that it seems a pity to accept an obviously bad site merely because it is cheap. As to the building itself, the only chance of its being a good one lies in its being built in some form of Gothic architecture. It really seems too stupid to take up a style like the sham Classical and to imitate an imitation—all the more as it really has been proved to be ugly and bad. Whatever may be said of our chances of developing a style of our own nowadays, the only chance is to start from a style which had growth in it. The Classical, or rather late Renaissance, style is but a bundle of whims—not a style at all really. To use it at present, when we are at least beginning to understand the historical value of art, is an evidence, it seems to me, of the feeling of mere cynical despair, which is so fatally common among our so-called cultured classes. Another word as to this building. The Liverpool folk, if they want to do something which will make its mark, must not be in a hurry; in a place like Liverpool anything like pettiness would be destructive of success. You want a building which shall both be big and look big. It would be much better to be contented with building only a part of it (*e.g.*, the choir) at first, just enough to house the church people, than to hurry up a building which might look complete, but which would be both small and mean.

## M. LEGROS ON FRENCH AND ENGLISH ART TRAINING.

THE evidence which was given by M. Alphonse Legros, the Professor of Art in University College, before the Royal Commission on Technical Education, was as follows:—

You are professor at the Slade school of University College?—Yes.

I believe you were formerly teacher of the etching class at South Kensington?—Yes.

You have had thorough experience in the system of art teaching as established now in France, and as we have it in England?—I have seen both systems, and thoroughly understood them.

Will you kindly give the Commission your opinion on the relative value of the two systems of art teaching, the system adopted in France and that in England, looking at it from the point of view which we are especially appointed to consider—that of industrial applications?—There are many schools in France for teaching industrial design which are very unimportant; but what is the case in France is that in the art schools those who do not become artists become industrial designers, they know how to draw. The great point is that they should have a thorough instruction in art.

Then, with regard to the English system, does the same remark apply?—No.

Will you kindly state in what respect it differs?—The principal thing is that the system of teaching which holds good in England is slow, vicious, feeble, and antiquated. What takes place in the English schools is that the students are set to work to copy an apple, or a sphere, or a cone, on which they spend a year, a second year is spent in copying a bad torso, and thus the student reaches thirty years of age and knows nothing. There may be, of course, varieties or exceptions, but this is the view of a man who looks at the system as a whole. Looking at this question from the student's point of view, a student at a Slade school has to pay 19 guineas per annum for the instruction. What son of an artisan or poor man could obtain one of the two annual studentships which are offered in that school?

Whilst, on the other hand, you state that the art schools in France are wholly gratuitous?—Yes; the schools in France are quite gratuitous. My father paid five francs, which is four shillings; that is the whole amount he paid for my instruction. I had to buy drawing materials; but my instruction only cost four shillings.

Then would you wish to see the instruction in art in England also made gratuitous?—Certainly; I would make the schools absolutely free. At the Slade school a young man, when it comes to the time for luncheon, takes a handsome gold watch from his pocket, and says, "I am off to lunch." There is no real application to the work; and among 100 young men there is only one who shows proper application to his studies.

You believe then that the gratuitous art instruction which is given in France produces a very marked effect upon the French industries, which are dependent upon that art instruction?—Yes, certainly; because it is the sons of working men who want to profit by it. Without this gratuitous character of

the instruction, the instruction is provided for those who do not want it.

Are you acquainted with the system of evening art instruction given under this department, the Department of Science and Art, throughout the country?—I know very little of it. There was an evening school at the Slade school during Mr. Poynter's time, but I only painted and drew there before the students in the morning classes.

Perhaps you are acquainted with the system of examinations; you may have inspected the drawings done for the English prizes, which are exhibited yearly at South Kensington?—I have seen a few of the drawings, but I notice in them the defect that they are very slowly done—only three or four in a year; the students always persisting in finishing up with delicate points; and if there are not more men driven mad by it in England, I cannot tell the reason. Mr. Poynter introduced the system of stumping, which was a great improvement.

We have been informed by certain teachers that this finish is a matter of some importance; that a man who can do a very finished drawing can afterwards accomplish anything he pleases?—The students who have spent their time in that way have no head for rapid work, spending, as they do, six weeks or a month in shading up a sphere; they get no ideas into their brains. What is wanted is to fill the mind with the appreciation of form, and this the English system does not give.

I believe that the system, under Mr. Poynter's direction, has undergone considerable alteration in the direction of quick and rapid drawing?—Yes, it has been much improved under his direction.

With regard to the number of examinations which the students have to pass in England, what opinions have you formed on that point?—A student has to pass examinations in too many things.

Your remarks have reference, I presume, to the system of the art instruction in the South Kensington schools?—Yes, there is too much examination work and too many lectures. I often noticed that my students were absent, and I inquired the reason, and I was informed that they were attending lectures. These lectures, I consider, are of very little value as a means of art training.

Then you are of opinion that the system adopted in France, namely, that pure art training shall precede any training in the art of designing, is the proper method to adopt?—Yes, because I do not see the difference between industrial art and pure art. I consider that the best designers and the best draughtsmen are those who can make the best drawings or have the best knowledge of art.

But it is one thing to draw the human form, and it is another thing to draw designs for silks or for cottons. Do you believe that it is necessary that the designer for silks and cottons should be able to draw the human form?—The difference is one of a very delicate shade. A man who knows how to draw very well can easily apply his knowledge to industrial designing.

Are you of opinion that up to a very advanced stage of their training the same art training applies to those students who are intended for the production of pictures as to those who are destined to follow industrial designing?—I believe the instruction should be identical. All the best artists of the Renaissance period were designers for furniture or for the industrial arts and manufactures.

What method would you think necessary or desirable in order to direct industrial designers into that particular branch of art for which they are intended, the tendency of nearly all art students in this country being to rush into pictorial art?—Nothing will stop that tendency but poverty.

Could you suggest any special method of training which should qualify and induce artists to take up a particular industrial line?—You must make them design a fabric which shall be actually carried out, or a piece of furniture which shall be actually made. If their designs are only on paper, the artists are like generals who have never fought. You must teach them practically; you must make *repoussé* work in *repoussé*, or carving in actual work, and not merely sketches on paper.

As long as you keep to designs on paper, it is your opinion that nothing more can be done than training in the direction of pure art?—Nothing, because they only prepare projects or schemes; they do not actually execute. And that has been the fault of your great designers. Flaxman was only a designer and not an actual executor of his designs, or merely to a very small extent, chiefly in pottery. Flaxman was forced to confine himself to working for pottery and to designing work, though he was a real artist who failed to have an opportunity to carry out his work in marble; but perhaps this is rather wide of the mark.

What is your opinion as to the natural aptitude of English character for the reception of artistic training as compared with the French?—The difference is primarily in education; the parents in England think that their children are born with an innate genius for landscape painting or something else. There is too much natural genius in this country, not enough study.

Do you consider that there is any inferiority in the capabilities of the English people in regard to the reception of art tuition?—Not at all. I think there is a great deal of natural energy among the young people here, and a great desire to distinguish themselves. The only thing is the influence of wealth; it is necessary for that to be eliminated.

Is there any reason why we should despair of producing in England a higher stage, or as high a stage, of artistic training in regard to industrial art, as that which now exists in France, if we adopt the same, or equally good, methods of instruction?—I am perfectly sure that there is not the least reason; but the gratuitous education lies at the root of the whole question.

Can you explain why it is that the principal designs for various kinds of industrial work are at present obtained in France?—Because Monsieur Dalou and myself, and other gentlemen like us, who occasionally want money, make a design, and you buy it.

Is there not also a very large supply of designing applicable to industries which is always available in Paris, and which is almost a commercial commodity?—It is not a very strong school; it is not these people who make the designs, or only exceptionally. It is perfectly true that there are a large number of designers, but they were educated for other purposes; they were educated and trained as painters and artists, but have failed and have become designers. All men study to become generals, not to become corporals, but they do not all become generals.

But that is not the view which we hear from the designers in Paris themselves?—No doubt, but I am betraying them.

Do you not attach very great importance to the influence of the splendid museums and art galleries in Paris, and, in fact, throughout France, as familiarising the people with high types of form and curve and other matters which go to make artistic feeling?—Certainly. But you have museums and galleries in London, and in England generally, comparable to those in France, only there are fewer here; but the fact is that in the provinces of France there are a large number of people who have not done well in Paris, but are thought a great deal of in the provinces, whereas in London you turn out a certain number of individuals who are very uniform in their general capacities, and who, when they go into the provinces, all show a stereotyped form of excellence.

Is that stereotyped form the fault of the education they receive, or is it the fault of national character?—It is not due to the national character, but to education. But another important point is that in France the best artists have studios where they take young men and teach them, in some cases gratuitously. This is a system wholly wanting in this country.

What is your opinion as to the actual artistic power and excellence of the workpeople in England compared with Frenchmen?—Certainly the English working-men are as capable as the French working-men. Open free adult classes, and you will prove that the English workman is as good as the French workman. In saying this I am speaking against my own interests, as I am connected with a school where fees are payable.

Are you aware that, connected with the Department of Science and Art, there are night classes at which instruction can be obtained at a very reasonable price?—It is quite possible that that may be the case; but the great want in England is that of skilled teachers; your artist academicians do not care to teach, and you suffer from the want of proper teaching.

Do you not think that, upon the whole, the national artistic power in England is, after all, rather on the advance than on the decline, as illustrated by the exhibits in recent times in large international exhibitions?—I think that it is on the increase, but the progress is very slow; there is progress, but it might be much more rapid.

I am speaking of art as applied to industry and artistic productions?—I think that they are doing better in England in those respects; there has been an enormous change in the last thirty years.

Do you think that the instruction given in the French primary schools has a very great effect in the production of art?—Little or none.

Could you point out any other provisions which you would think necessary in order to improve the art teaching in England besides the establishment of cheap or even gratuitous classes?—In addition to this cheap instruction, you must have a teacher who is an exhibitor at the exhibitions, and who, by his position, can encourage his pupils and lead them on.

Your opinion is, in fact, that the English teachers are not artists, and the artists are not teachers, whereas both ought to be blended in one?—Yes.

What is your opinion as to the models and casts supplied to our art schools and established in our chief art educational establishments, compared with similar articles supplied to the French schools?—In your London school at Kensington you have plenty of models and casts, more than the French schools; but among them are a good many bad ones which

should be got rid of. This has been done to a certain extent already by Mr. Poynter; but in the country schools there are not enough models and casts.

Do you think it of very great importance to encourage the establishment of museums of industrial and suggestive art in the provinces in England?—Yes, that would be a very good thing; the influence for good would be enormous.

And do you think that these collections should apply especially to the industries of the districts, or that they should be of a more general art educational value?—They should be general, rather than special. If you confine yourself to one branch you can only choose the best thing in that one branch; and these would have to be superintended by artists; and that is why I think the collection should be of a general character.

Do you think it of great importance to establish modelling classes throughout England?—Certainly. I think that those classes would be of the highest importance, both in London and in the provinces; and for every three men you trained who turned out good artists five would turn out good industrial designers.

Do you think that art training, with a view to industrial designing, should be given in direct relation to the materials and the industry to which it is intended to be applied, or should it always be of an abstract nature?—It must be general.

At Sèvres, for example, we found that the art training had special and, in fact, exclusive relation to the china manufacture?—I think that you are scarcely aware that they have two classes of artists there; one the men who give the designs, who are artists in the true sense of the word; the other, the men who are paid so much a year to transfer these designs to porcelain in order to make presents of them. I may mention that Solon was an artist who furnished such designs; Rodin, the eminent sculptor, was another.

In other words, the highest walks of industrial art are always occupied by the true artist?—Yes.

Is there any other point that you would desire to bring before the Commission; we should be glad to hear your opinion on any other matters which may have occurred to you?—I have answered the questions put to me; I have nothing to add.

#### PUBLIC TASTE IN SCOTLAND.

AT the banquet which was given on the eve of the opening of the exhibition of the Royal Scottish Academy the president, Sir William Fettes Douglas, in proposing "The Lord President, Magistrates, and Town Council of Edinburgh," said that he had mentioned before in that room what a great thing in the world taste was. He was not going to allege that the Magistrates were deficient in it. Taste went a great deal further than most people believed. If they understood it properly, it took the place of virtue in the world to a great extent. For instance, it was bad taste indeed for a man to murder his neighbour, or to carry off his neighbour's wife. It was very bad taste for a School Board to propose alterations on the finest modern Classical building in existence, for a wretched inhabitant of the finest square in Britain to build a façade to his house which destroyed the beauty of that square, or of a wretched man in one of the best localities in Glasgow to propose to paint the outside of his house in Rob Roy tartan. When he went along certain streets of the town, and saw the abominations put up in the streets, he was inclined to use, mentally, very bad language. He was not alone in that matter. Very many people did the same. Suppose there were one thousand people each day passed these abominations and indulged in muttered curses; if they multiplied that thousand by 365, what a fearful amount of muttered curses they got. And that did not go on for one year, but for many years. If they multiplied these muttered curses by the number of years in which they were indulged, it became a question whether, say, 100,000 or 1,000,000 muttered curses must not be considered quite as bad as two or three murders. The Magistrates were about to apply to Parliament for an Act to extend their powers. He wished they would get powers also for preventing many abominable changes in towns. The Magistrates and Council were the judges of such matters, but they ought to take power to consult the best judges in the world—he did not care where they were to be found. When the Dean of Guild was applied to for permission to alter a house, he should send the plans to London, out of the way of all possible influence in Edinburgh, and get the very best advice, and pay a good fee for it. They should no longer have those abominations which were put up every day in Edinburgh. He was glad, indeed, to hear that the Council were about to apply for powers to erect new municipal buildings. He should willingly pay his taxes for that purpose if they employed a good man. If they did that he thought the Council would confer a great boon upon the city.

Mr. D. Bowie has bequeathed 2,000*l.* for the erection of a Wesleyan church in Blairgowrie, N.B.

## Bygones.

*"Antiquity after a time has the grace of novelty."*—HAZLITT.

### SHELLEY ON THE THREE TEMPLES AT PÆSTUM.

IN March 1818 Percy Bysshe Shelley, the poet, left England never to return. A year before, the Court of Chancery had decreed that he was not a fit and proper person to take charge of his two children, and he fled to Italy possibly from a fear that the law might afflict him still more. He appears to have resided for some months at Lucca, where he commenced his "Prometheus Unbound," then at Naples, and afterwards at Rome, where the poem was completed. While at Naples, in February 1819, Shelley visited the famous ruins at Pæstum, and as the following account of his journey was in a letter to his friend, Mr. Peacock, it is probably the least known of the poet's writings:—

There was a Greek city, sixty miles to the south of Naples, called Posidonia, now Pesto, where there still subsist three temples of Etruscan architecture, one almost perfect. From this city we have just returned. The weather was most unfavourable for our expedition. After two months of cloudless serenity, it began raining cats and dogs. The first night we slept at Salerno, a large city situate in the recess of a deep bay, surrounded with stupendous mountains of the same name. A few miles from Torre del Greco we entered on the pass of the mountains, which is a line dividing the isthmus of those enormous piles of rock which compose the southern boundary of the bay of Naples, and the northern one of that of Salerno. On one side is a lofty conical hill, crowned with the turrets of a ruined castle, and cut into platforms for cultivation—at least every ravine and glen, whose precipitous sides admitted of other vegetation but that of the rock-rooted ilex; on the other, the ethereal snowy crags of an immense mountain, whose terrible lineaments were at intervals concealed or disclosed by volumes of dense clouds, rolling under the tempest. Half a mile from this spot, between orange and lemon groves of a lovely village, suspended as it were on an amphitheatral precipice, whose golden globes contrasted with the white walls and dark green leaves which they almost outnumbered, shone the sea. A burst of the declining sunlight illumined it. The road led along the brink of the precipice towards Salerno. Nothing could be more glorious than the scene. The immense mountains covered with the rare and divine vegetation of this climate, with many-folding vales, and deep dark recesses, which the fancy scarcely could penetrate, descended from their snowy summits precipitously to the sea. Before us was Salerno, built into a declining plain, between the mountains and the sea. Beyond, the other shore of sky-cleaving mountains, then dim with the mist of tempest. Underneath, from the base of the precipice where the road conducted, rocky promontories jutted into the sea, covered with olive and ilex woods, or with the ruined battlements of some Norman or Saracen fortress. We slept at Salerno, and the next morning before daybreak proceeded to Posidonia. The night had been tempestuous, and our way lay by the sea sand. It was utterly dark, except when the long line of wave burst, with a sound like thunder, beneath the starless sky, and cast up a kind of mist of cold white lustre. When morning came, we found ourselves travelling in a wide desert plain, perpetually interrupted by wild irregular glens, and bounded on all sides by the Apennines and the sea. Sometimes it was covered with forest, sometimes dotted with underwood, or mere tufts of fern and furze, and the wintry dry tendrils of creeping plants. I have never, but in the Alps, seen an amphitheatre of mountains so magnificent. After travelling 15 miles we came to a river, the bridge of which had been broken, and which was so swollen that the ferry would not take the carriage across. We had, therefore, to walk 7 miles of a muddy road, which led to the ancient city across the desolate Maremma. The air was scented with the sweet smell of violets of an extraordinary size and beauty.

At length we saw the sublime and massy colonnades, skirting the horizon of the wilderness. We entered by the ancient gate, which is now no more than a chasm in the rocklike wall. Deeply sunk in the ground beside it were the ruins of a sepulchre, which the ancients were in the custom of building beside the public way. The first temple, which is the smallest, consists of an outer range of columns, quite perfect, and supporting a perfect architrave and two shattered frontispieces. The proportions are extremely massy, and the architecture entirely unornamented and simple. These columns do not seem more than 40 feet high, but the perfect proportions diminish the apprehension of their magnitude; it seems as if inequality and irregularity of form were requisite to force on us the relative idea of greatness. The scene from between the

columns of the temple consists on one side of the sea, to which the gentle hill on which it is built slopes, and on the other of the grand amphitheatre of the loftiest Apennines—dark purple mountains, crowned with snow, and intercepted there by long bars of hard and leaden-coloured cloud. The effect of the jagged outline of mountains, through groups of enormous columns on one side, and on the other the level horizon of the sea, is inexpressibly grand.

The second temple is much larger, and also more perfect. Beside the outer range of columns, it contains an interior range of column above column, and the ruins of a wall, which was the screen of the penetralia. With little diversity of ornament, the order of architecture is similar to that of the first temple. The columns in all are fluted, and built of a porous volcanic stone, which time has dyed with a rich and yellow colour. The columns are one-third larger, and, like that of the first, diminish from the base to the capital, so that, but for the chastening effect of their admirable proportions, their magnitude would, from the delusion of perspective, seem greater, not less, than it is; though perhaps we ought to say, not that this symmetry diminishes your apprehension of their magnitude, but that it overpowers the idea of relative greatness, by establishing within itself a system of relations, destructive of your idea of its relation with other objects, on which our ideas of size depend.

The third temple is what they call a Basilica; three columns alone remain of the interior range; the exterior is perfect, but that the cornice and frieze in many places have fallen. This temple covers more ground than either of the others, but its columns are of an intermediate magnitude between those of the second and the first.

We only contemplated these sublime monuments for two hours, and of course could only bring away so imperfect a conception of them, as is the shadow of some half-remembered dream.

It is needless to say that Shelley was in error in describing the temples as Etruscan architecture, instead of Doric. It is remarkable that he estimates the height of the columns in the Temple of Ceres at 40 feet, while the measured height, including capital, is only 20 feet 4 inches. In the Temple of Neptune, which is the largest of the three, the columns are 28 feet 11 inches high, and in the so-called Basilica 21 feet. Shelley may have written by a slip of the pen 40 feet for 20 feet, but it is more likely that he was impressed by the ruins, and, like the majority of visitors, have fancied that the dimensions are larger than they are in reality.

#### ENGLISH FRESCO PAINTING.

Among the manuscripts in the Soane Museum is one by John Martin, dated 1699, which contains the following instructions for wall-painting as practised in his time:—

1. In painting on walls, to make it endure the weather, you must grind your colours with lime-water, milk, or whey, mixed in size colour-pots.

2. Then paste or plaster must be made of well-washed lime, mixed with powder of old rubbish stones. The lime must be often washed, till finally all its salt is abstracted, and all your work must be done in clear and dry weather.

3. To make the work endure, strike into the wall stumps of headed nails, about 5 or 6 inches asunder, and by this means you may preserve the plaster from peeling.

4. Then, with the paste, plaster the walls a pretty thickness, letting it dry, but scratch the first coat with the point of your trowel longways and crossways as soon as you have done laying on what plaster or paste you think fit, that the next plastering you lay upon it may take good key and not come off nor part from the first coat or plastering; and when the first coat is dry, plaster it over again with the thickness of half a barleycorn, very fine and smooth. Then, your colours being already prepared, work this last plastering over with the said colours in what draught or design you please—history, &c.—so will your painting unite and join fast to the plaster and dry together as a perfect compost. Note, your first coat of plaster or paste must be very haired with ox-hair in it, or else your work will crack quite through the second coat of plastering, and will spoil all your painting that you paint upon the second coat of plastering; but in the second coat that is laid on of paste or plaster, there must be no hair in it at all, but made thus:—Mix or temper up with well-washed lime fine powder of old rubbish stones (called finishing stuff), and sharp grit sand, as much as you shall have occasion for, to plaster over your first coat, and plaster it all very smooth and even, that no roughness, hills nor dales be seen, nor scratches of your trowel. The best way is to float the second coat of plastering thus:—After you have laid it all over the first coat with your trowel as even and smooth as possibly you can, then take a float made of wood very smooth, about 1 foot long and 7 or 8 inches wide, with a handle on the upper side of it to put your hand into, to float your work withal, and this will make your

plastering to lie very even; and lastly, with your trowel you may make the said plastering as smooth as may be.

5. In painting be nimble and free; let your work be bold and strong, but be sure to be exact, for there is no alteration after the first painting, and therefore heighten your paint enough at first—you may deepen at pleasure.

6. All earthly colours are best, as the ochres, Spanish-white, Spanish-brown, terra-vert, and the like; mineral colours are naught.

7. Lastly, let your pencils and brushes be long and soft, otherwise your work will not be smooth; let your colours be full and flow freely from the pencil or brush, and let your design be perfect at first, for in this there is no after alteration to be made.

#### MR. WILLIAM MORRIS ON DESIGN.

THE following evidence was given by Mr. Morris before the Royal Commission on Technical Instruction:—

I believe you are connected with various branches of manufacture in which designing is an important element?—Yes. The business I carry on comprises weaving, dyeing, cotton-printing, carpet-weaving, glass-painting, and cabinet-making.

Do you employ designers?—To a very small extent.

Do you make your own designs?—Yes, mostly; I do not employ designers, because, amongst other reasons, it is so very difficult to get a due amount of originality out of them; the designs which one gets are too hackneyed, and there is the same sort of idea harped upon for ever and ever.

Yours is a peculiar trade?—Quite.

Your forte is originality?—It is necessary for our business merely as a commercial affair. I need not say it is desirable in everything in which one applies design to the industrial arts.

Comparing nation with nation, you believe originality to be a quality possessed by the people of this country?—Certainly. We hear a great deal about the superiority of the French in design, which I do not think is an essential point of difference of character between the English and French as a people.

You think it is a question of training?—To a very great extent; the French are above all things masters of style in the arts of design. For my part, I doubt if they have so much innate love of beauty as a great part of our population has. In matters of style the French are supreme; they can take two or three ugly things and combine them into a congruous whole, which looks plausible at least.

You consider mastery of style to be a national characteristic of the French?—It most undoubtedly is. Being a national characteristic they understand it thoroughly well, and they have worked the vein very hard. As a designer, I think it is that mastery over style which gives the French that superiority in the European markets, in certain classes of goods, which they undoubtedly possess.

Could you define a little what you mean by mastery of style?—What I mean is a kind of faculty which enables a man to take certain elements of form, and work them into a congruous whole, which strikes the eye at once. There is something that goes home to one at once, when a man is *au fait* at style. English designers to a certain extent flounder about, I may say, and they are apt to get vague and scattered.

You say while you think that the French have a mastery of style not possessed by other nations, they have not the same innate love of beauty that a great many Englishmen have?—That is so. I think that in appreciation of beauty, in love for beautiful lines and colours, the French cannot be said to be superior to the English, certainly not in matters of colour.

Then it is rather in the technical application of natural qualities which they may possess, more or less, that you think their superiority consists?—The French have certainly a tendency in all things to system, the turn of their minds runs towards system, and that applied to art produces this tendency towards style which in some respects they overdo to my mind. So long as a thing is in a definite style, it seems to satisfy the ordinary French mind, even though it is obviously ugly.

I suppose what you call style might be described to some extent as congruity?—Yes.

Making one thing fit in with another?—Yes.

Have you paid any attention to the question of our position as designers in various manufactures, distinguishing one from the other?—I know something about it. The department of manufacture into which design enters, that I know most of from my own business, is textiles, and in that department certainly the French have a much greater reputation than we have. We copy largely from the French in some things. I was in Manchester some time ago, and a calico-printer there showed me his designs, and, on my asking where he got them, he told me he got most of them from Paris. From what he said I judge that it is common there to buy parcels of drawings from Paris, and shuffle and piece them into a variety of patterns.

Can you tell us anything about any other trades into which design enters; take wall-papers, for instance?—Wall-papers

are more used in England than in France for what may be considered artistic decoration. I should say that, on the whole, the English designs were more original and better in design than the French, at any rate since the last twelve years. Wall-papers are of rather a higher class in England than in France, on the whole.

Take the coverings of furniture and the hangings of rooms, woven and printed stuffs, as distinguished from garments?—I do not know much of what the French do in printed furnitures, and I do not suppose that to be a strong point of theirs; but on the other hand they have an enormous variety in the way of woven stuffs for furniture, and their cleverness in adapting material and shifting things about is very great. Sometimes we have people call upon us from the South of France, Lyons and Arles, and one is quite amazed at the amount of cleverness shown in these things in the working up of unpromising materials. I do not much admire the goods myself, but they are clever things, and showy, and very cheap.

When you say people have called upon you from the South of France, do you mean designers?—No, people who were bringing patterns to us as upholsterers—people with patterns of stuffs.

It would not follow that the designs originated in Lyons or Arles?—No, I could not say where they were produced. I know that they study their own designs with a great deal of care, and I know there are one or two firms that have carried on the making of furniture stuffs at Lyons for a great number of years.

You would not be surprised to be told that the Lyons people get their designs from Paris?—I should think it quite likely myself. I think it is a thing to be rather deprecated that there should be a class of mere artists like some of these Paris designers, who furnish designs, as it were, ready made, to what you may call the technical designers, the technical designers having next to nothing to do with the drawing, but having what you may call the grinding work to do. The designer learns about as much as is necessary for his work from the weaver, in a perfunctory and dull sort of manner, and the result is not so satisfactory as it would be if a different system were adopted. I think it would be better, when it could be managed, that the man who actually goes through the technical work of counting the threads, and settling how the thing is to be woven, through and through, should do the greater part of the drawing.

When you say better do you mean commercially better?—In the long run yes, because on the whole one must suppose that beauty is a marketable quality, and that the better the work is all round, both as a work of art, and in its technique, the more likely it is to find favour with the public. I must allow, I fear, that the possible change I am suggesting would raise the price of the article. Division of labour does a great deal to cheapen goods; but, on the other hand, I think it does a great deal to deteriorate them.

You think there would be a sufficient demand for a high class of goods, the designs for which were furnished by an artist, who not only prepared the design, but arranged its being put upon the loom?—I should think so myself. There will, of course, always be a very much larger market for the very cheapest articles. In France there is certainly a large market for a high class of goods.

So far as textiles are concerned, you are aware, no doubt, that, as regards the low class of goods, we have nothing to fear from Continental competition, and the object rather is to ascertain how we can best establish a trade and a reputation for goods of a high class?—Yes. But in figure weaving for furniture the French do a great deal which cannot be called low-class goods, but which are cheap considering the amount of show in them; cheap artistic goods, in short.

At present it appears that we have to compete with goods woven in the French departments and designed in Paris?—I do not know quite enough about the French trade to know whether that is so.

So far as silk goods go it certainly is?—I was led to suppose so. I was led to understand that there was a body of designers in Paris, who really practically designed for all the textile trades, both printing and weaving.

That being so, what would you recommend to be done in this country in order to enable us to hold our own against the French?—What I want to see really is, and that is the bottom of the whole thing, an education all round of the workmen, from the lowest to the highest, in technical matters as in others, and that this should be obtainable in the several centres of industry—that is, a man should not be obliged to have to come to London to learn his work, but should be able in some way or other to do all that was necessary in the way of study in his own town, wherever it might be.

Seeing that that hitherto has not been done in France, but that everything is centred in Paris, do you believe that it would be possible for us, by so scattering our forces, to accomplish as good work, good in the sense of paying, as the French are able to do by concentrating everything in Paris?—It would take time of course. Addressing myself to the higher class of

goods, I think the way in which we should look at the thing, as a matter of competition, is not to try to attack the French on their ground at all, but to try to produce our own styles; if we do that we may, in the long run, even command the market in France for designs and so on. To a certain extent, I believe that is the case now, that designs which are being brought out in some classes of art have decidedly attracted the attention of Frenchmen.

Are you now speaking of textile goods?—Rather of the whole range of design in general.

Are you aware of the fact that your own designs have been pirated and applied to a certain extent in France?—I do not know that they have in France. America is our friend in that respect chiefly.

How would you set about the training of designers in the provinces, assuming that it was considered desirable to promote such education in the provinces?—My view is that it is not desirable to divide the labour between the artist and what is technically called the designer, and I think it is desirable on the whole that the artist and designer should practically be one.

And you assume that the artist is to be a provincial?—I should not say that he should necessarily be a provincial, but he probably would be by residence.

How would you train him?—There are two chief things that would have to be thought of in providing facilities for study for the art of design. However original a man may be, he cannot afford to disregard the works of art that have been produced in times past when design was flourishing; he is bound to study old examples, but he is also bound to supplement that by a careful study of nature, because if he does not he will certainly fall into a sort of cut-and-dried, conventional method of designing, which is the bane of most of these French designs that we are talking about; and the only way for a person to keep clear of that, especially one in the ordinary rank and file of designers, is to study nature along with the old examples. It takes a man of considerable originality to deal with the old examples, and to get what is good out of them, without making a design which lays itself open distinctly to the charge of plagiarism. No doubt the only help out of that is for a man to be always drawing from nature, getting the habit of knowing what beautiful forms and lines are. That, I think, is a positive necessity.

How would you organise a provincial school of art with a view to instruction in design?—That is a very wide question. I must say, in the first place, I think a man who is going to be a designer wants to be taught to draw thoroughly. In all these manufacturing towns there are departmental schools of art, and one may assume that a man goes through his course there, which, as far as I can understand, is a good course on the whole.

Are you aware that there is a great difference of opinion with regard to the instruction in drawing that is given in those schools, and that it is stated that in France much more attention is paid to rapidity of execution than in this country?—If it is not carried too far, rapidity of execution is a good thing. I suppose that those who regard rapidity of execution as an important thing mean that one should not expect the students to elaborate their drawings. I quite agree with that; that is to say, I think that in drawing from the round, and so on, elaborate cross hatching and that sort of thing is a mistake; you want to teach form by drawing.

Are you of opinion that that mistake prevails to an injurious extent in our schools of art in connection with South Kensington?—It did so at one time; but I know that Mr. Poynter, the late director of art, tried to correct the evil; he very much objected to what I should call mere mechanical finish in drawings.

Your opinion is, that in examining the drawings which are sent up too much value is not given at present to extreme finish?—Certainly not, as far as I can judge. For several years past I have been one of the judges, at the national competition here, in certain classes; and, in these classes certainly, the judges always make a point of valuing what I should call the fundamental qualities of the draughtsman, his perception of form, and so forth.

If it should be the opinion of art masters in the country that this high finish is necessary in order to obtain a place in these national competitions, that opinion is quite an erroneous one?—Undoubtedly erroneous as regards finish merely for its own sake.

Are there any departures from the present curriculum of the provincial schools of art, that you would consider essential so far as preliminary training goes?—I think not. I do not know with any degree of nicety what the training is, but I think not.

That is to say, assuming they follow out the direction which it is intended to impress upon them from South Kensington?—Yes. Of course every one knows that the character of the work done at the different schools depends very much upon the masters at the head of them. There is one thing which I think, perhaps, might be more impressed upon those masters

than it is, and that is that one does not particularly want to train up the students as picture painters. There are some schools where that is overdone; but that is a matter of accident, owing to the master having a turn in that direction.

You consider it necessary that the designer should be acquainted with the manufacture for which he is designing; you believe that the mechanical application of the design might with advantage be taught in an art school, but you are not sufficiently acquainted with schools of that class to say how they ought to be organised or what is possible in them. At the same time you believe that it is necessary that by some means, either in the school or in the factory, the designer should make himself acquainted with the exigencies of the machine and material in which the design is to be executed?—Yes, I speak as strongly as I can upon that. I think that that is the very foundation of all design.

Do you consider that elementary literary instruction has much influence upon the ultimate success of a workman as a workman?—I should certainly say it has, undoubtedly. I often have great difficulty in dealing with the workmen I employ in London, because of their general ignorance.

Would you consider that, in addition to literary instruction, instruction in drawing should be given in elementary schools, to those who are to become artisans in after life?—I think, undoubtedly, everybody ought to be taught to draw just as much as everybody ought to be taught to read and write.

You are aware that drawing is taught in the elementary schools?—More or less.

Could you give us an idea as to the extent of the general art training which you think it necessary that a man who intended to be a designer should go through? Is he to continue his general art training up to drawing from the life, for example?—It is rather a difficult question to deal with; my own view is that drawing should be taught more or less from drawing the human figure, because it gives you a standard of correctness that nothing else can do. I should not say, however, that it was absolutely essential. There are some people who have no great turn for drawing from the figure, who would nevertheless make clever draughtsmen in drawing plant form.

Do you think that a designer should continue his general art instruction, after he is employed in his trade as a designer, in night schools, and so on?—It would be most desirable: I think that it is the only way in which he would keep his mind fresh upon the subjects that he would be taught there.

You spoke of style as being the characteristic of French art. Is that a matter of education, or is it innate?—I think both. The French certainly have it innately, and they generally take great pains to develop it.

You think, with an improved system of art education in England, the style of English design would be greatly improved?—Certainly; you might easily give a student enough idea of style to answer his purpose, and to go side by side with his own special idiosyncrasy and the idiosyncrasy of the nation.

Do you know whether there exists in London any school of professional designers similar to that which exists in Paris?—I do not think there is such a school. Of late years there has arisen in London a great number of half professional designers, people who would be glad to get work in designing: these people are generally very uneducated in the technique of the arts they design for, which is a great drawback to them and to the public, which does employ them more or less.

Do you know whether those professional designers supply the provinces to any considerable extent with designs?—My impression is that they do not.

## THE HOUSE PAINTERS' TRADE IN LONDON.\*

UNTIL about thirty years ago in nearly all branches of trade, and especially in the building trades, it was the general custom for masters, as the employers or tradesmen were then usually termed, to themselves work at their respective trades, and they, as a rule, took apprentices for the term of seven years. The legal indentures made it compulsory upon these masters to teach the youths, or cause them to be properly taught, their trades. The prevailing custom up to the time I have referred to was for employers to take work from their customers and charge for it according to the amount of material used and the number of hands employed, and the opportunities for making large profits, therefore, did not exist then as now. The relations of "masters" and workmen or apprentices were therefore closer and more intimate and friendly.

About thirty years ago, however, this system of conducting work changed somewhat rapidly for the one of estimating or contracting for the whole work, to be done at a given price and

to be carried out under specifications, with a clerk of works representing the engineers, architects, or surveyors, in the customer's interest. Probably this new system arose from the general difficulty to the customer under the old system of ascertaining how much any given quantity of work would cost until it was fully completed. As soon, however, as the "contract" system of doing work got a hold in the country, it quickly extended and soon became the order of the day.

Under this new system "masters" no longer cared to be bothered to take apprentices to teach them their trade, but sought only for the skilled workmen close to hand. This skill they simply used as a means to accumulate wealth, without giving any attention to its future production. The continuation of this plan for some fifteen or twenty years began to tell its tale, and the deficiency of well-skilled artisans and mechanics was sensibly felt. The employers then found that although they had plenty of labour at hand it was only semi-skilled, and that unless something was done to teach youths their respective trades the whole character of English work must inevitably be lowered, and a natural decadence of industrial excellence take place. In addition to this neglect to provide handicraft skill the employers also instituted the plan of dividing and subdividing the work, whereby a man who formerly did two or three branches of a trade devoted himself only to one. The object of this was manifestly to increase the man's power of production, which, if it did not lower his general conception and capacity as a workman, certainly instituted a precariousness of employment which has been injurious and demoralising. The whole character of the employers has changed. From being actual workmen or experienced masters they generally have become capitalists, who conduct their works in too many instances without practical knowledge.

If in a few cases journeymen in some firms have had youths placed with them as apprentices, or under their charge to be taught their trades, it is scarcely ever made to the interest of the workman to teach the youth, who, on the completion of his term of probation (his employer in the meantime receiving all the advantage of his underpaid labour), will become a competitor in the labour market, and it cannot be wondered at if the "lad," under such circumstances, does not get a proper and systematic teaching. The deficiency of skilled workmen has, no doubt, induced employers to make a general demand for "technical education," as if that or, more properly speaking, "scientific instruction," could ever take the place of handicraft skill. It is yet to be learned whether the technical instruction as now given is calculated to improve the character of the work done, or simply to increase the man's power of production. This cry for "scientific instruction" for workmen as such is delusive, and, as at present carried out, will do little or nothing to supply well-skilled handicraftsmen, or, as I will call them, "manipulators of material."

It is obvious to me that the apprenticeship system has broken down under the method of work by "competitive contract," with the division and sub-division of labour under capitalistic employers, who have failed to take proper precautions for the production of industrial skill, and for this breakdown employers are generally and directly responsible. Another fact must always be kept in sight, and this is that in the practical work of everyday life workmen are not allowed to exercise what technical skill they possess; for, after attending a class over night, they will soon get their scientific notions scouted if they attempt to put them in practice on their job or in the workshop the next day. All that has been determined previously by the contract price, and every object is subordinated to the one of making the job pay.

Nearly the whole of the instruction given in existing art schools is worthless to the actual operative, and is greatly above his head, relating as it does to theories which the operative workman is never called upon to know or to exercise. It might be alleged that this instruction will, by giving him a wider and more comprehensive knowledge of the theories underlying his trade, fit him to take a higher position as clerk of works, surveyor, draughtsman, &c., &c. If this be so, it is a kind of instruction that cannot be called instruction for a workman; he has been simply lifted from the grade of a workman to another in the managing department, and is no longer an operative, nor has his instruction been useful to him as such. It should therefore be called an "instruction for the production of architects, draughtsmen, clerks of works, engineers, surveyors, &c."

As a test in point, I may say that about 12 years ago I went with some fellow-workmen, with the intention of forming a class at the West London School of Art, in Bolsover Street, which is, I believe, one of the best in the kingdom, and there we found that the subjects taught were not of the least practical value to us as house painters and decorators. The whole of the instruction was too elaborate and artistic, and meant a long course of study and practice, impossible and useless for us to try. Had we attempted it, we might at our time of life have become "mongrel artists," and have been spoiled as workmen. On my pointing this out to the head master, Mr.

\* From a paper by Mr. George Shipton, secretary of the Amalgamated Society of House Decorators and Painters, presented to the Royal Commission on Technical Education.

Stewart, who, by the way, was a practical house decorator as well as teacher, he was so impressed with my representation that he gave us a separate room apart from the regular school of art, in which we received two lessons per week, at the rate of 12s. each. One was given by himself upon the harmony of colour for practical house-painting and decorative purposes, treating of work which it would fall to the lot of the operative painter to execute; the other lesson was by the second master, afterwards, I believe, head master of the Leicester School of Art, in geometrical and freehand drawing. We were only taught, however, how to draw simple ornaments suitable for rooms where the expense of an artist was impossible, yet so well balanced and appropriate in form and colour that the room would be greatly and tastefully improved with very little additional expense. As the charge for these classes fell entirely upon us who attended them, and some members were called away to work in other parts, the cost became too heavy, and we had with deep regret to give them up, as the teaching was just what we required to improve us as practical workmen. Of course, if a workman has the ability or genius to become a good artist, let him by all means have every facility and encouragement; but let us insist on his being an efficient handicraftsman while he professes to be a workman. It is worse than absurd to expect that from any system of scientific instruction we can have a well-skilled workman, a good artist, general draughtsman, architect, and surveyor rolled into one for 9d. or 10d. per hour, which some people seem to expect.

With regard to what is desirable in such instruction as is given, I would submit the following points:—1. That neither the rules and regulations of the Science and Art Department, nor those of the City and Guilds of London Technical Institute, are adapted to the present requirements of skilled artisans and mechanics. 2. No scheme of technical instruction can be considered satisfactory unless provision is made for trade teaching in a workshop, combined with theoretical lectures relating to and based on the instruction given in the workshop. 3. It is unnecessary and unpractical to expect workmen to attend long courses of twenty-eight or thirty lectures, as at present required by the foregoing institutions. 4. Uncertainties or fluctuation of work cause about 50 per cent. of those who commence attending winter courses to drop off and fail to attend the final annual examinations, held about seven months from the commencement of the course. 5. Short courses of lectures (four to six) combined with trade practical teaching are better adapted to modern requirements and the fluctuations of trade. 6. So long as the system is continued by the State, the Government should, through the Science and Art Department, give greater assistance to practical technical schools or classes, and they should discourage the vast number of theoretical classes, held by science teachers without practical experience throughout the country. 7. The qualification of teachers in technical and science classes should be gained in a different manner; more regard should be paid to the actual experience of a teacher in his subjects, the present examinations enabling anyone to set up as teacher immediately on passing an examination. 8. There should be large central trade schools in populous neighbourhoods, and occasional courses of trade teaching, and lectures in suburban districts. 9. Geometry, freehand, and model drawing should be compulsory subjects for all trades in a school. 10. Trades classes should be conducted by skilled workmen. 11. Each trade school should have as director a person practically acquainted with the trade requirements, and with sufficient theoretical knowledge of science to give lectures on the principles underlying the workshop practice.

It is quite possible to carry out these foregoing principles, as I have seen some of them in operation at the Polytechnic Institute, where certainly the best kind of instruction, suitable to workmen while they profess to remain so, is given that I have witnessed or heard about. Employers should be held responsible in every way possible, to afford facilities for youths to be systematically taught for a given or fixed term, say of five years. I mean that they should take the boys and give a fixed term to them in their factories. This, if accompanied with the theoretical instruction in schools to which I have referred, would enable them to become as proficient in five years as they formerly did in seven, because, under the old system, the first one or two years of the youth's apprenticeship was spent in drudgery not much connected with learning his trade. This would allow of boys remaining at elementary schools until they were sixteen years of age, and if capable of being carried out, is highly desirable in our public and national interests.

I have only one other suggestion to make. From my experience employers also require instruction. If workmen use every effort to attain the highest degree of skill, employers and the public should allow them every opportunity of producing good work, otherwise it will be very discouraging to workpeople. To obviate this to some extent I would suggest that spaces be set apart in our museums and public palaces, in which should be exhibited various specimens of work produced by workmen, with their names and residences attached. These specimens could be arranged in classes or grades, beginning with the

plainest samples to the most elaborate. The public could view these specimens of work and would demand that their work should be as well done as these samples. Prizes might be offered for original and good productions of hand-skill, and this would stimulate the workman to excellence in his branch of industry. By thus bringing before the public the specimens of good work and bringing them face to face with the workmen, it would lead to inquiries which must result in good and in the production of better work. The employers have everything their own way, and make what representations to their customers they please, and by selfish conduct cause the frequent complaints urged by the public against workmen. Scamped or slop-work is demoralising to the workpeople, it is a fraud on the customer, and is injurious to the public interests. To prevent this as much as possible, whether on the part of employers or workpeople, should be the constant aim of a true Science and Art Department, and this would make it worthy of the nation and useful in sustaining our industrial prestige.

## BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting was held at Queen's College on Tuesday evening, February 17. The vice-president (Mr. W. H. Kendrick) delivered an address. He first of all dealt with the affairs of the association, and inferred that, judging from the present and increasing success of the classes, &c., the prosperity in the future was assured. The connection now existing between the London society and the one he was addressing was commended as serving to mutually strengthen each other for the promotion of the interests of the profession. The lecturer then gave his views upon the education of architects, and recommended the pupilage system supplemented by technical study, as by this method the vigorous individuality of British design would be sustained. He desired also a greater appreciation of the art workmen, and as a means for their improvement he desired the establishment of a technical museum in Birmingham. This would contain a competently-arranged collection of specimens of every period of architecture and sculpture. He contended if this were accomplished, that the art-work of the town would be raised in tone, and the workman, by the study of good examples, would be dissatisfied with his present meaningless productions.

On the proposition of Mr. H. H. McConnal, and supported by Messrs. R. B. Morgan and Victor Scruton (hon. sec.), a hearty vote of thanks was accorded to the lecturer.

## THE TOL-HOUSE, GREAT YARMOUTH.

SOME interesting discoveries have just been made at this curious building, so well known to antiquaries from its equally curious history, having been not only the usual place of assembly for the town, although not a town-hall, but the common prison as well. The fabric dates from the early part of the thirteenth century and has an external staircase leading to an open porch on the first floor, from which election and other addresses were delivered. The building was doomed to destruction not long since, but by a vigorous effort made by some of the townsmen and others, the decree was reversed, and the structure handed over to trustees to be devoted to some useful purpose. A subscription fund was opened and the work of repair was entrusted to the architects, Mr. Loftus Brock, F.S.A., of London, and Messrs. Bottle & Olley, of Yarmouth. During the stripping of the roughcast and cement which have covered the old walls for many years, a fine series of small moulded arches has been found below the windows of the open porch. These rest on corbels, and are of much beauty. Below these the Gothic arch which formerly gave light and air to the common hold, or prison, has also been found. All will be carefully repaired. The form of the old windows of the hall has also been recovered. The fine timber roof of the hall has been repaired and opened to view, and it is now proposed to fill the windows with heraldic glass containing the arms of the principal among the old local families.

## LEGAL.

Liverpool Assizes.—Feb. 17.

(Before MR. JUSTICE WILLS.)

HORNBLOWER & SONS v. HESKETH.

ARCHITECTS' FEES.

This was an action brought to recover certain sums of money for work done, and 1,250*l.* for commission. The amount charged for work done and 500*l.* towards commission had been

paid into court, leaving 750*l.* in dispute. The plaintiff was Mr. Frederick W. Hornblower, carrying on business as an architect in Liverpool, under the style of Lewis Hornblower & Sons, and the defendant was Sir Thomas Hesketh, Bart. The claim was made in respect of plans for what would have practically been the rebuilding of Rufford new hall, and the amount was calculated at the rate of 2½ per cent. The building in question was not the picturesque old hall of Rufford which is seen by passengers on the railway, but the new mansion which, even according to its owner, has a "barrack-like aspect." Sir Thomas Hesketh contemplated important alterations on the new hall, and employed the plaintiff to prepare the plans, which included not only an ornamental exterior, but also a grand staircase and details of oak carving for the suite of reception rooms. Sir Thomas also required a racket court, American bowling alley, and an estate office. The plaintiff prepared tracings, plans, and bills of quantities; but in the summer of 1882 the defendant, who was then in America, changed his mind as to the restoration of Rufford Hall, and resolved, at the desire of Lady Hesketh, to alter another house at Easton Neston, in Northamptonshire. The work occupied plaintiff and his assistants for two years. It was averred that the plans had been seen and approved by the defendant. The estimated cost of carrying out the proposed improvements was 50,000*l.*, and upon this sum the commission was claimed at 2½ per cent., which was said to be the regular professional remuneration for plans and designs when the work was not carried out. The plans which had been prepared were produced by the plaintiff. It was alleged for the defence that the defendant never contemplated such a large expenditure as 50,000*l.*; that plans relating to that amount had not been authorised by him, and that 20,000*l.* was the outside figure to which he would go. The plaintiff in his examination said, however, that no limit had been mentioned. When his evidence was completed a consultation took place between the parties, and a verdict was then entered by consent for the plaintiff for 300*l.* in addition to the 500*l.* which had been previously paid into court, Sir Thomas Hesketh admitting the merit and value of Mr. Hornblower's work, and Mr. Hornblower admitting that the cost had proved to be more than Sir Thomas Hesketh had anticipated.

### GENERAL.

**Mr. Holman Hunt's** *Flight into Egypt*, of which there are two pictures, will shortly be exhibited in London.

**Mr. White** is now exhibiting in Glasgow his three pictures—*Her First Dance*, by Mr. W. Q. Orchardson, R.A., and *The Stowaway* and *A Waif*, by Mr. J. E. Millais, R.A. They were lately seen in his gallery in King Street.

**The Scottish Royal Academy Exhibition** opened on Saturday. Following a practice of the two past years, the sales of pictures will not be published.

**Messrs. Braun** have taken a photograph of Terburg's *Convocation of Munster*, the small picture crowded with portraits which was purchased by Sir Richard Wallace for 7,000*l.* and presented to the National Gallery.

**The Fawcett Memorial** at Salisbury is to consist of a bronze statue in the market-place, the total cost of which will be about 1,000*l.* Up to the present the subscriptions received and promised amount to 800*l.*

**Mr. Hutchison, R.S.A.**, has completed a marble bust of the late Dr. W. Lindsay Alexander. It will be placed in a wall niche at the Augustine Church, Edinburgh.

**M. David d'Angers**, the son of the celebrated sculptor, intends to present the series of medallions modelled by his father to the French Government. They will probably be deposited in the Louvre.

**Mr. Joseph Clarke, F.S.A.**, has been appointed architect to the Charity and Endowed Schools Commissioners.

**Scottish Society of Water-Colour Painters.**—At a meeting of this society, held in Edinburgh on the 13th inst., the following Associates were elected members of the society, viz.:—Mr. Thomas Scott, Edinburgh; Mr. Duncan Mackellar, Glasgow; Mr. David Farquharson, A.R.S.A., Edinburgh; and Mr. A. S. Boyd, Glasgow. The following candidates were elected Associates, viz.:—Mr. Arthur Melville, Edinburgh; Mr. D. McGregor Wilson, Glasgow; Mr. W. Macgregor, Glasgow; Mr. James Macmaster, Glasgow; Mr. John Carlaw, Glasgow; Miss Shield, Edinburgh.

**The Trustees** of the British Museum having brought the subject of the opening of the Natural History Museum on Sunday afternoons under the notice of the Government, it has been decided not to provide the funds which are required for the purpose. The Council of the Institute of Painters in Water-Colours have arranged to open their exhibition free to the Sunday Society on February 22 and March 1.

**A Monument to Cardinal Mezzofanti**, by Bonola, has been completed for erection in Rome near Tasso's monument.

**Mr. Alfred Darbyshire** on Sunday delivered a popular lecture on architecture at Ancoats, in which the distinguishing features of the principal styles were pointed out, and it was shown how each style was developed. There was nothing, he considered, in the whole history of art so beautiful, so truthful, and so majestic as the Gothic cathedral. It was full of a mysterious atmosphere, and the slender shafts ending in the vaulted roof seemed to carry the soul to heaven.

**Mr. F. Robinson**, of Blackburn, has been appointed architect for the new schools of St. Michael in that town. The second place in the competition was obtained by Mr. J. W. Shurrock, and the third by Messrs. Stones & Gradwell.

**Mr. Charles Dixon** has been appointed a demonstrator of mechanism and applied mechanics at Cambridge, in the place of Mr. J. H. Nicholls, B.A., who has resigned.

**The St. Lazare Station** in Paris, which is the terminus of the line from Dieppe, is about to be enlarged, the Minister of Public Works having approved of the arrangement between the company and the municipal authorities of Paris.

**Mr. William Landless**, architect, of Glasgow, has entered into partnership with Mr. H. E. Clifford, also of Glasgow, and the business will be carried on at Mr. Landless's office, in West George Street.

**Mr. J. H. Morton**, of South Shields, is preparing plans for a proposed higher-grade school at the Grange, for the Jarrow School Board.

**The Metropolitan Public Garden Association** have contributed 100*l.* to the Lambeth and Westminster Districts towards the cost of planting trees in the public thoroughfares and providing ornamental seats.

**A School Chapel**, erected from the plans of Messrs. Douglas & Fordham, of Chester, was opened at Holywell on Tuesday. It will seat about three hundred people.

**An Industrial Exhibition** will be held from July to November next in the Palais de l'Industrie, Paris. It will embrace three foreign sections, devoted respectively to England, Belgium, and Italy, with the view of showing side by side the processes of manufacture followed by each country. M. Ducret, President of the Chamber of Syndics, Paris, has charge of the arrangements.

**Messrs. Perry & Co.** announce their annual writing and drawing competition. Prizes are offered of the value of twenty pounds, ten pounds, and several other sums for the best pen-and-ink drawing. The drawings are to be 6 inches by 9 inches. Particulars may be obtained on application by letter to Messrs. Perry & Co., Holborn Viaduct, E.C.

**Messrs. Clark & Moscrop**, of Darlington, have received instructions to prepare plans for laying-out the new cemetery at Richmond (Yorks.), and erection of chapel and lodge.

**The St. Petersburg Ship Canal** has been completed, and ships of large tonnage can sail direct to the port of St. Petersburg, without, as heretofore, undergoing transshipment of goods at Cronstadt. The canal, which is 26½ versts in length (1 verst = 5½ furlongs), runs from the Island of Goutouiew, in the Neva, to the Cronstadt roads, and has an average depth of 22 feet, and a portion of the Neva has also been dredged to the same depth.

**The Vestrymen of St. James's, Westminster**, have proposed to replace the lamps at the Guards' Memorial with lamps of modern construction. The scheme has not been sanctioned by the Commissioners of Works, who have pointed out that the lamps were designed in connection with the monument.

**Glasgow Philosophical Society.**—A meeting was held on Monday of the architectural section of the Glasgow Philosophical Society. Mr. Landless presided. Mr. R. A. McGilvary read a paper on "Plasterwork." He confined himself to the plain branches, and said he hoped at some future time to say something of the ornamental branches. Mr. Henry Morrison subsequently read a paper on "Slates." He traced the growth of slate rock, and pointed out the localities of the principal slate ranges in this country. He also referred to some of the more important slate quarries, to slates as a covering for roofs and as articles of commerce.

**We understand** that the Wilkes' Metallic Flooring Company, of 17 Devonshire Square, E.C. (to whom was awarded the only gold medal for paving at the International Health Exhibition held at South Kensington last year), have received instructions to pave the Old London Street at the International Inventions Exhibition.

**Messrs. Perry & Co., Limited**, of Birmingham and Holborn Viaduct, have just declared a dividend of 10 per cent. for the year 1884, and have carried a sum of 3,000*l.* to the reserve fund, as against 2,000*l.* for the preceding year. The auditors were Messrs. Quilter, Ball & Co.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, FEBRUARY 21, 1885.

## GOLBOURNE CATHEDRAL, NEW SOUTH WALES.

MESSRS. HEATON, BUTLER & BAYNE, of Garrick Street, London, have just shipped two large stained glass windows for Goulbourne Cathedral, one for the east of chancel the other north transept. The east window consists of seven long lights and elaborate tracery in the Decorative style, and is filled with figure work, very richly coloured, illustrating *The Angel's Appearance to the Shepherds, Christ as a Child in the Temple, Baptism, Sermon on the Mount, Crucifixion, and Ascension*. In the numerous pieces of tracery above the lights are emblems and Christian symbols. The following inscription is inserted at the base of the window:—"Erected in memory of William Bradley, born 1800, died 1868; and of Emily Elizabeth, his wife, born 1812, died 1848; by their daughters Emily Jane Pearse, Kate Heard, Minna Bradley-Robinson, and Alice Caroline Roberts, 1885." The north transept window, consisting of six lights and tracery, contains eighteen figure panels from Old Testament history, which subjects are arranged in bands of colour across the window, having pattern work between. The inscription on this window reads as follows:—"To the glory of God and in loving memory of Thomas Sutcliffe Mort, who entered into rest the 9th day of May, 1878." This window was executed under the supervision of Mr. J. D. Crace, of Wigmore Street, on behalf of the Mort family. The Bishop of Goulbourne has taken considerable interest in the work, both in placing out and selecting the subjects of the window. The above works were executed at a cost of 1,000*l*.

## THE RAILWAY RATES BILLS.

A PETITION to be presented to Parliament against the new Railway Rates Bills has been drawn up by the British Iron Trade Association, and it has received the support of other influential associations connected with the iron and steel industries. It says that (1) the Bills propose to charge undefined sums in addition to the maximum rates for the cost of and expenses incurred at stations, thereby introducing a principle at variance with the uniform practice of Parliament in fixing maximum rates, and imposing upon traders an unjustifiable expense in litigation in order to ascertain the amount legally chargeable for the conveyance of minerals, goods, and cattle, and practically rendering the maximum rates useless, and no longer a protection to the public using the railways; (2) that the Bills propose to increase the maximum rates on almost every article specified in the several Acts, including all kinds of iron and iron-making materials, upon the faith of which the powers granted to the several companies have been conferred by Parliament, and contain also numerous provisions of an injurious and objectionable character; (3) that the attempts of the companies so to add to the burdens of agriculture and trade are unwarrantable, and a violation of the public

faith in the Acts of the several companies, in reliance upon which numerous works have been built and vast expenditure incurred by traders and others; and that, if the said Bills pass into law, new burdens will be imposed upon the industry and agriculture of the country, with consequences disastrous to their welfare.

## MORTGAGEES AND JERRY BUILDERS.

IN August 1882 proceedings were taken by Mr. A. Payne, the district surveyor of East Hackney (south), against a builder, who was fined 3*l*. and costs for not using proper mortar. As he made no alteration to the structures, the Metropolitan Board of Works proceeded still further against him, and the magistrate made an order that the houses should be taken down. The defendant then appealed to the High Court of Justice, having in the meantime mortgaged the property. The magistrate's ruling, however, was confirmed, and judgment was given for the Board, and after great delay, by an arrangement with the mortgagees, all the parts built with bad mortar have been taken down. In the interest of the public, there is no doubt that houses built with bad mortar should be levelled to the ground. It is to be regretted, however, that under the present system of building the mortgagees may in such cases chiefly suffer, while the builder, who certainly deserves punishment, escapes practically free. But it is also true that there are other cases in which the builder is a mere dummy to shield some real owner, who carefully keeps his name and ownership out of sight so as to escape the penalties of the Building Acts.

## BUILDERS' RISKS.

AN action was lately heard in the Edinburgh Sheriff Court, in which a provision merchant sought to recover 200*l*. from Messrs. William Beattie & Sons, builders, Edinburgh, for damages which, he alleged, resulted to his stock and to his business through the dampness of the above premises erected by the defenders. The shop belonged to the northmost tenement in the street, and, according to plaintiff, the dampness was due to the exposure of the gable to the weather. Messrs. Beattie denied and explained a number of the plaintiff's allegations, and stated, among other things, that he, instead of waiting until the premises got seasoned, insisted upon entering them immediately after they were finished, and before the plaster had had time to dry. Any damp, they contended, was only such as was incidental to new premises, or, at all events, was quite trifling. The Judge found that the premises in question during the whole or part of the time they were occupied by the plaintiff were untenable by reason of excessive damp, and unfit for occupation as a grocer's shop, and that, in consequence of the condition of the premises, which the defendants failed to remedy, notwithstanding complaints made to them, the plaintiff suffered damage to the extent at least of 20*l*. For this sum Messrs. Beattie were declared, together with costs,

## NATURAL VENTILATION.

AS most of our readers are aware, the main agents which tend to make, or mar, all systems of "automatic"—or more properly "natural"—ventilation are the wind, the law of "diffusion of gases," and the movements generated by particles of air at different temperatures. We think it will be denied by few that any "system" of ventilation if it is to succeed must be carried out in strict accordance with the natural laws which everyday phenomena illustrate. In all schemes for efficient ventilation, the engineer is confronted by stern facts and not by theories. "The building has certain definite dimensions," "It is to accommodate a given number of people for a certain space of time," "So much gas, or other illuminating agent, is to be employed." The engineer, if he be up to his work, will know exactly how much fresh air to supply, through what sized apertures, and where to introduce it, guarding against draught, and so forth. Having made up his mind as to the requisite supply of fresh air, he will, if wise, turn his attention to getting rid of the vitiated air. He will calculate to an exactitude the rate at which supply and removal are to be permitted, in accordance with the laws which govern the natural movements of the atmosphere.

In ancient times it was a common custom, especially in the East, to fix tubes (not unlike our "bell-mouth" ventilators) on the roofs of buildings, and to cause the wind to blow down these shafts, and diffuse throughout the house, finding exit as best it could. Now, however, *nous avons changé tout cela*, and we make use of ventilators to extract the air which has become vitiated. Few will deny the usefulness of exhaust ventilators in stimulating natural ventilation currents. Speaking broadly, there are two main groups into which schemes of ventilation may be divided.

1. Those schemes in which the exigencies of the case demand that both the vitiated air be extracted and the fresh air be supplied from a level higher than the space to be ventilated (*e.g.* on ship-board, railway tunnels, house drains).

2. Those schemes in which the vitiated air is extracted from "ceiling level" and the fresh air admitted at the ordinary level (*e.g.* schemes for church, hall, or room ventilation).

For some years past Mr. Sampson Low, B.A., F.R.Met.Soc., has been engaged in perfecting schemes of ventilation to meet the requirements which almost any and every combination of circumstances could demand. For the requirements of ship ventilation Mr. Low employs two sets of shafts—downcast and upcast. The downcast shafts are each fitted with his patent "Hermes Crown Injector," which may be described as follows:—

"The ventilator consists of a shaft surmounted by a dome. The dome is connected to the shaft by means of 'baffle plates,' which divide the space between shaft and dome into equal compartments. Beneath the dome is fixed a 'wind guide' (which surrounds the shaft as a collar, and is attached to both shaft and 'dome') for conducting the air into the

dome, whence, owing to accumulated pressure, the current passes in the direction in which there is least resistance, *i.e.* down the shaft, and so on to the compartment to be ventilated. At first sight it might appear that the air could only enter from one side of the ventilator, namely, that against which the wind impinges; such, however, is not the case, as the air, pressed by accumulated pressure down one side of the ventilating shaft, induces a current in the same direction over the whole area of the pipe, whence it is led by branch pipes to various parts of the space to be ventilated."

The extracting system commences by small ducts in each of the compartments to be ventilated. These ducts terminate in a main exhaust shaft, whose sectional area is greater than the sum of the sectional *areae* of the tributaries. This main exhaust shaft is fitted with the "Hermes Crown Ejector," of which the following is a brief description:—

"This ventilator consists of three essential parts: (1) the shaft, to which is fixed (2) a dome-shaped chamber or 'wind-chest,' and (3) a 'cap,' which surmounts the whole structure. From whatever direction the wind strikes the dome, its upward curves cause the current to pass across the orifice in the dome, thus inducing a current at right angles to itself up the shaft, and so extracting the foul air from the drain below. If the wind strikes down vertically on the top of the ventilator, the downward curves of the 'cap' deflect the current, causing it to rush down the outside of the ventilator, past the space between the cap and dome; this vertical current induces a draught at right angles to its own path (*i.e.* horizontally between the cap and dome, and so over the extracting orifice of the ventilator), which, in its turn, creates an exhaust current vertically up the shaft of the ventilator, and so extracts the foul air."

Both these ventilators fulfil the essential requirements of yacht and ship ventilation, being impervious to water while allowing free passage to air. That they have found favour with eminent sanitarians, shipbuilders, and shipowners is abundantly proved by the following considerations:—The ventilators have been

adopted by H.M. Government, the Russian, Dutch, and Queensland Governments, and by many British and foreign shipowners, who speak very highly of the efficiency of the ventilators. Mr. Low's scheme for tunnel ventilation, and also his system of sanitation, space does not allow of our describing. We will merely say both are thoroughly scientific, and full particulars may be obtained at the establishment of Messrs. Sharp & Co., 11 Holborn Circus, London, E.C.

When we come to consider Group II. (of which schemes for the ventilation of churches and public buildings may be taken as typical examples), the chief difficulties to be encountered are, we think, popular prejudice to the appearance of exhaust ventilators on the roof, and difficulty of bringing in the fresh air in such a volume and at such a temperature as to be almost, if not quite, imperceptible to the senses. As far as the objection of unsightliness of exhaust ventilators on the roof of a church is concerned, we think Messrs. Sharp at once disarm criticism, for they have succeeded in bringing out some handsome designs of Mr. Low's patent without in any way interfering with the efficiency of the apparatus.

With regard to the admission of fresh air, and the temperature of the incoming current, very often the ventilating engineer is not consulted till all heating apparatus has been fixed, and it then remains only to adopt contrivances to the existing arrangements. Existing arrangements is an inclusive term, and there are perhaps a dozen or more special appliances which could be used with each combination of existing arrangements; so, taking all things into consideration, we will not discuss this point.

and architects willing to compete are invited to send their names and addresses to Mr. A. Young, 97 Wellington Street, Glasgow. The competition will be limited to ten architects to be selected.

WOLSTANTON.—March 2.—Plans are required for School and Caretaker's House. Mr. Henry Farmer, School Board Offices, Tunstall.

### CONTRACTS OPEN.

ABINGTON.—Feb. 27.—For Supplying Pair of Lock Gates. Messrs. George Siddons & Sons, Surveyors, Oundle.

BASINGSTOKE.—Feb. 23.—For Laying Water Services. Mr. H. Budden, Borough Surveyor, Basingstoke.

BELFAST.—March 3.—For Building Congregational Hall, Rosemary Street. Mr. W. J. Fennell, Architect, 11 Chichester Street, Belfast.

BELFAST.—March 14.—For Widening Queen's Bridge. Mr. J. C. Bretland, Borough Surveyor, Town Hall, Belfast.

BIGGAR.—Feb. 24.—For Supply of Cast-iron Pipes (11,630 yards): Mr. L. Murray, Surveyor, Biggar.

BIRKENHEAD.—Feb. 24.—For Supply of Three Iron pontoons. Mr. A. Gill, Town Clerk, Municipal Offices, Birkenhead.

BIRKENSHAW.—Feb. 25.—For Tanks, Pit, Filter, Lime-house, Boundary Walls, and Works in connection with the Drainage. Mr. W. Crutchley, C.E., Town Hall Chambers, Wakefield.

BIRMINGHAM.—For Building Chapel at Smethwick. Mr. J. H. Burton, Architect, Warrington Street, Ashton-under-Lyne.

BLACKBURN.—Feb. 23.—For Building Stables. Mr. J. H. Stafford, Secretary, Hunt's Bank, Manchester.

BRISTOL.—Feb. 23.—For Building Lodge at St. Agnes Park. Mr. C. F. Hanson, Architect, Clifton.

BURNLEY.—For Building Public Assembly Rooms, Houses, and Shops, St. James's Street.

### COMPETITIONS OPEN.

COLCHESTER.—March 25.—Designs are required for Remodelling and part Rebuilding the Cups Hotel. Mr. H. H. Elwes, Secretary, Exchange and Cups Hotel Company, Colchester.

GLASGOW.—Feb. 28.—Plans are required for the Erection of District Asylum at Hartwood,

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.]  
EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY,

LI LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH

### Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.

# The Architect.

## THE WEEK.

It was at one time proposed to erect a new building for the British Embassy in Berlin, but it is now arranged to purchase the building which had been used for the purpose. A new building was estimated to cost 50,000*l.*, but on the score of economy alone, it is supposed to be preferable to pay a sum of 72,000*l.* for the old embassy house and furniture. According to the explanation of the Chancellor of the Exchequer, a house that is expected to cost 40,000*l.* is sure to amount to 60,000*l.* By that ratio the new house at Berlin would run up to 75,000*l.*, and there was the cost of furniture to be added. As the buildings abroad are all undertaken by the surveyors of the Office of Works, Mr. CHILDERS's explanation is not likely to be read with gratification in Whitehall Place.

MESSRS. CHRISTIE will next week submit to public competition a large and interesting collection of the works of the late Mr. HARRY JOHNSON, whose sudden and lamented death took place on the last day of the past year. Mr. JOHNSON travelled and painted with the late WILLIAM MÜLLER in his journey through Lycia. He subsequently visited Greece, Spain, and Italy, and the present collection is rich in the varied results of his labours. Mr. JOHNSON produced many remarkable oil pictures, but latterly worked principally in that style of pure water-colour which is so peculiar a characteristic of the English school.

THE committee of the Liverpool Art Club announce that they propose to hold an exhibition of works of art by amateurs, comprising oil and water-colour paintings, drawings in black and white, wood carvings and modelling. Medals will be awarded to the most deserving works. The exhibition will be opened on Monday evening, April 27, and exhibitors are requested to send in their works not later than Monday evening, April 13. The competition is open to all amateurs, whether members of the club and residing in Liverpool or not. The regulations may be had from Mr. HENRY E. RENSBURG, the hon. secretary of the art club.

ACCORDING to the new return of the Metropolitan Board of Works, the rateable annual value of the metropolis for the present year is 28,920,537*l.* The valuation of the City of London, which amounts to 3,545,368*l.*, is included in that sum. The parishes of which the valuation runs to seven figures are St. Mary Abbott's, Kensington; St. George's, Hanover Square; St. Mary, Islington; St. Pancras, St. Marylebone, Lambeth, Wandsworth, and Paddington.

A DECISION of the Court of Appeal on the subject of underpinning, if acted upon generally, would have important consequences on the question of the easement of support. The legal maxim is that land has an indefinite extent upwards and downwards, but the Metropolitan District Railway Company, having constructed a part of their concrete wall under stables in Whitechapel without the owners' permission, and the Court of Appeal having approved of what was done, the old maxim is no longer of universal extent. The case is a very curious one. A clause in the Company's Act for extensions authorises the underpinning or otherwise strengthening of houses within 100 feet of the railway, compensation being paid for any inconvenience or damage which might arise. The Company required the ground on which stood stables, which were at the back of premises in Whitechapel, for making their extension, but the owner declined to sell a part of his premises. The Company then slightly changed the direction of the line, so as to just clear the stables. A concrete wall was constructed under the stables, which was an encroachment on

the owners' property, and it was made a counterfort to a retaining wall on the railway side, which was only 9 inches thick. Was the mass of concrete under the stable to be considered a work of underpinning or a part of a retaining wall? Mr. Justice CHITTY held that it was the latter, and therefore illegal. The Court of Appeal, on the contrary, decided that it was underpinning. It was admitted by the Lords Justices that, in underpinning, what is sought is vertical support; while in Whitechapel it was evident that lateral support was also given. But that was regarded as an accidental result; and the fact that the Company derived benefit from a kind of work that was intended to serve another purpose was treated as "a windfall." The decision means that a wall can be looked at in several ways, and can be supposed to subserve several uses, and that is a novelty in the courts.

THE Committee of Management of the proposed new Training College at Norwich, with the assistance of their assessor, Mr. EWAN CHRISTIAN, have provisionally accepted the design of Messrs. OLIVER & LEESON, of Newcastle-on-Tyne, architects, but subject to certain modifications in respect of arrangement and to conditions as to verification of estimate. They beg to thank the other architects from whom they have received plans for the trouble they have taken in preparing their designs.

THE house in High Street, Hampstead, which was for a long period occupied by CLARKSON STANFIELD, R.A., was on Wednesday evening opened as a public library and literary institution. This is making a worthy use of the building, and the directors can preserve the associations by adorning the walls with a series of engravings from STANFIELD's pictures. The library has been for the last fifty years supported by many of the notabilities who have selected Hampstead as a place of residence.

It is proposed to erect at Cannes a chapel in memory of the late Duke of ALBANY, on a site given by Mr. SAVILE, adjoining the Villa Nevada, in which His Royal Highness died. The site was chosen by His Royal Highness the Prince of WALES during his recent visit. Plans have been supplied by Mr. A. HEWETSON, architect. Messrs. TAYLOR & RIDDETT, bankers, Cannes, and Messrs. COURTTS & Co., London, have consented to receive subscriptions. The church will be dedicated to St. GEORGE, the patron saint of England.

IN the Supplementary Civil Service Estimate, which was published this week, a sum of 83,520*l.* was entered for the National Gallery, and it was said that a saving of 3,980*l.* was anticipated on the sums of 70,000*l.* and 17,500*l.* paid respectively for the *Ansdei Madonna* of RAPHAEL and VANDYKE's equestrian portrait of *Charles I.* When in June of last year an estimate of the value of the two pictures was given by Sir F. W. BURTON, the Director of the National Gallery, the sums put down for them were 110,000*l.* and 30,000*l.*, and at the time a still larger sum was demanded by the Duke of MARLBOROUGH. In July 1884 the price of the pictures, according to His Grace's agent, was 160,000 guineas. It will thus be seen that the Treasury has brought down the cost to less than one-half of what was supposed to be obtainable seven months ago.

THE increase in the value of house property in Paris is exemplified in the sale of the houses on the Quai Malaquais, which have been just purchased by the State for additions to the Ecole des Beaux-Arts. In 1823 the houses were sold for 750,500 frs. The price paid by the Minister of Public Instruction has been 4,200,000 frs., or in about sixty years the price has been raised six times higher. It is also to be remembered that in the late sale all fixtures of any importance have been excluded. The value of the site is about 840 frs. a mètre. The position is far from being aristocratic, and is, moreover, one of the last that would be selected by any man but a bookseller for a shop.

## ARTISTS AND CRITICS.

IT would seem as if Mr. WHISTLER's ambition was to be able to give occasional surprises to the public. He knows that novelty is a quality which is much esteemed in London, and by providing it he has often deserved such gratitude as a certain class of people can bestow. The lecture which was given on Friday night in last week was the latest of the surprises. It was believed that Mr. WHISTLER could do a great many clever things, but as his patrons are not much given to reasoning, it was not anticipated that the artist could compose and deliver a most captivating address. The effect of it was heightened by the use that was made of time as an accessory. Lectures are common enough in London, but to hear a lecturer commence at ten o'clock at night is one of those remarkable events which society treasures. A delicate compliment had been offered, and was appreciated as it deserved. It mattered little what was said, the Hour and the Man were the attractions. To the artist's friends there was nothing extraordinary about the affair. They were aware that when he is in the mood Mr. WHISTLER can talk of art in a way that would make the fortune of an Academy professor, and that his occasional remarks exhibit a subtlety which corresponds with what is seen in his etchings.

A work of Mr. WHISTLER's would be nothing if not original, and the disregard of conventional rules in the Piccadilly lecture was enough to make the great BLAIR send an angry remonstrance from Elysium. Recognition was, however, made of a fashion that is now quite common among lecturing folks in going back to prehistoric ages. It was delightful to hear the rebuker of those prosy archaeologists who seek for knowledge in museums and crypts instead of allowing their fancy full play, unfolding his researches among primitive peoples. But it would be too great a shock to a fashionable company to allude to the cave-dwellers, who were in the habit of scratching portraits on the bones which they had just gnawed, and accordingly Mr. WHISTLER gracefully began with the tent period. If it is not more definite than other men's starting-points, it had the advantage of suggesting to young ladies a happy time when the world went a-gipsying. We are henceforth to suppose that on one of those days, when the tent-dwellers had gone forth to their respective, if not respectable, avocations, a certain light and airy savage remained behind "with the women," and inspiration having come to him he produced a symphony for them by means of a gourd and the piece of stick which served for a poker. He traced strange devices just as readily as if he possessed a plate and a needle. When those who went forth returned no objection was raised about the fellow's idleness and his spoiling a gourd. They were as much charmed as if they had been in the habit of paying shillings to Bond Street Galleries. The biting of lines in gourds became popular, and it was found pleasanter to pass away the time in art work than to run the chance of being knocked on the head by Philistines whose gourds remained as Nature made them. When the gourds were exhausted there was a likelihood that the artists would have to "go forth," but inspiration came once more to their aid. They took lumps of clay and made them into gourds, and their descendants might have been employed to this day in the same manner (or at least until the clay was exhausted) if it had not been discovered that Nature was slovenly in her contours, and that art-pottery, which might be more worthy of bearing the strange devices than a gourd, was indispensable. Beautiful vases forthwith came into existence, and they were the forerunners of couches, and tables, and knicknackeries, for which room was found in a tent with as much ease as additional families are accommodated in seaside lodging-houses.

Happy would it have been for the world if it went on so harmoniously, but in course of time art-enemies arose whose wickedness was displayed in producing the strange devices at a cheap rate. The gourds were no longer considered as masterpieces, to which one might hope to live up, but as materials for "squash." The artist's occupation went forth never, perhaps, to return, and in place of it appeared the craft of the manufacturer, the huckster, the critic, the middleman, the preacher, the archaeologist, and the unattached writer. Nevertheless, Mr. WHISTLER was

not without a little hope that the gods would send an artist occasionally to enjoy himself at the river side, and to accompany the morning in its early walks.

Mr. WHISTLER may appear to be freakish, but just as he has a reason for the slightest touch of colour he puts on a canvas, so there is a theory in his lecture for which much can be said. It is the relation between the artist and the public, or rather such among the latter as assume the office of criticism. If we understand his allegory, it has been Mr. WHISTLER's desire to suggest that the artist is an inspired being, and should be respected accordingly. We have authority that is not to be questioned for the belief that the Gentiles "are a law unto themselves." May we not without irreverence apply it, and say that the artist is a law unto himself? When an artist—call him painter, sculptor, architect, poet, or dramatist—expends his thought on a work, is it not reasonable to suppose that he has produced something which is the result of definite laws, although everybody may not be able to trace their influence? The poem or the building will have unity if it be the expression of its creator's thought at the time; but it is absurd to suppose that a critic will in all cases be able to follow the thought by a glance. The artist himself is not always able to recall the motives under which he acted in producing his work. He is compelled to let it speak for itself. GOLDSMITH could not explain the meaning in which the word "slow" is to be taken in the first line of "The Traveller," and, in consequence, it was supposed that he was only part author of the poem. But readers who have no need to make capital out of imaginary defects have found no difficulty in the interpretation of the word. Another word could not be substituted for it without injury to the poem. The experiment has been tried by BENTLEY and a second critic to amend the greatest poem in the English language; but what they have perpetrated has shown that they were unable to comprehend the poetry of "Paradise Lost." SCOTT proposed to add a verse to one of BURNS's songs, and produced most wretched doggerel. The amendment of a work in one of the fine arts offers even greater difficulty. In burning the lines on the gourd (to return to Mr. WHISTLER's allegory) the artist was far in advance of the men who afterwards stood around the vessel, and it will hardly be said that in our day the critics are wiser and more skilful than the artists they judge.

The conditions under which criticism is conducted at the present time are a sort of guarantee of imperfection. Apparently it is not considered necessary to devote much time to the work. The Royal Academy by its practice maintains that there is not the least difficulty in examining a couple of thousand of paintings, statues, drawings, etchings, designs, enamels, in a single day—for that is the time assigned officially to the critics. It is not to be wondered if the public, conductors of journals, and the critics come to the conclusion that the Academicians may be right, and that the most impartial criticism is that which is produced by going over works at the rate of three hundred an hour. Even with unrestricted time it is difficult to insure criticism of any worth, owing to impartiality being very rare. A writer who has practical knowledge of painting, sculpture, or architecture (and no others are qualified for critics) is likely to have a pet style which becomes a sort of standard and interferes with his justness of view. In spite of his knowledge and extreme honesty of purpose, Mr. RUSKIN would be called one-sided in his "Notes" on his exhibitions, and although no one would suppose that Mr. FERGUSON had anything to gain by an opinion, it would be believed with difficulty that he was an eligible assessor in a case where Gothic designs were opposed to Italian or Classic. Artists of all kinds are not to be regarded as safe judges of one another's works, and when they do condemn they are more unsparing than the bitterest newspaper critics.

But after all, what is the use of the best criticism? An error in a book is remediable by means of printer's types when the hour arrives for a second edition, but how many imperfections have been rectified in pictures, statues, and buildings after critics' eyes have grown tired in seeking for them? Gallons of ink have been expended in pointing out the imperfections of the pepper boxes at Trafalgar Square, but they still remain in their old positions for the amazement of foreigners. Living artists who exhibit at the Academy appear to be as obdurate as railway directors to

the suggestions which have been offered to them. Mr. WHISTLER has been condemned ever since his figure of a piano-player was hung in the Academy, and, in consequence, is one of the most popular of artists. The men who have suffered most by partial ignorance and flippant criticism are architects.

Criticism, good, bad, and indifferent, will however continue as long as it expresses with tolerable accuracy the opinions of the public in general. People also like to be spared the trouble of thinking, and it is not every one who has his history and science always at command, although he is sure to be an infallible judge of colour and form. It may be worth knowing that the grapes which are seen on the outside of a house are only to be found within vineries, that there is authority to show that a red feather in a cap should have been white, or that a coat should have a button less than is painted. But taking all things into account, we doubt if, with the exception of architects, criticism has done much to lessen the reputation to which an artist is entitled by his works.

## TECHNICAL EDUCATION.—II.

WE promised to return to the subject of technical education, and to explain the views of English manufacturers as they were brought before the Royal Commission. Men of that class have an interest in the subject which is much deeper than that taken by official people. They are veritable captains of industry, and, as such, have to sustain contests of a kind that could hardly be understood in a Government office. Home and foreign competition at the present time is no child's play, and we need not wonder if many manufacturers are convinced that for success they must depend on themselves, and that it would be an absurdity to look for aid from the Science and Art or any other Government Department. What has to be answered is, "How to do it," and there is a belief that the question is the one which has received the least attention among official persons.

The conclusions which have been arrived at on the subject by an important class among English manufacturers, cannot be expressed more tersely than in the words of Messrs. WILLIAM TONKS & SONS, of Birmingham. They say, "We believe the purely technical part of instruction may be acquired as well or better in our workshops," and, considering the standing of the firm as metal-workers, there will not be much difference among practical men on that point. Messrs. HAYWARD, TYLER & Co. may claim to be considered a representative firm in their line, and they give utterance to a similar opinion in different words when they write, "We do not find, nor do we think it is likely, that any such system of instruction can ever prove more than a useful adjunct to the system of apprenticing learners for at least three or five years. In our experience, it is only in this latter way that a practical knowledge of mechanics can be obtained." The managing director of a Nottingham company says, "The best technical knowledge is to be had in the workshop, and there is much truth in this for the majority. As to the technical schools abroad let us judge by results—Which is the most intelligent workman? Why, an Englishman or an American. And what countries produce the best machinery? Why, England and America." One of the large firms of cotton spinners corroborates this view, and points out that the most successful men in the business have been those who from early practical training became thoroughly acquainted with the machinery and material. They conclude by saying, "We do not think that any system of training would be at all equal to the practical knowledge acquired in a cotton factory, and more particularly if the student is impressed with the conviction that a successful livelihood or otherwise is to be the result of his efforts." Even more emphatic are Messrs. CLAY, of London, the printers, who say, "We find that the best workmen for our purpose are those brought up by ourselves, while others, even after their apprenticeship, are often quite unfit for any but the most ordinary work."

While it must be admitted that there is truth in the opinions we have just quoted, it may be objected that workshop or factory teaching has a tendency to empiricism. The best way to avoid that defect will be by the imitation of the plan which has been adopted at Sir WILLIAM ARM-

STRONG & Co.'s works at Elswick. Science classes have been established at the cost of the firm, and in them the humblest boy has the opportunity of learning the theory which he can see put in practice from day to day. In the first place there can be no misunderstanding about the nature of the instruction. It is imparted in the Elswick Mechanics' Institute, and consequently amateurism need not expect to be cultivated by its means. But the range of studies in the institute, if limited to those which are related to the business of the firm and district, is ample enough for a very high class of students. It comprises mathematics, geometrical and machine drawing, mechanics, physics, inorganic chemistry, manufacture of iron and steel, mechanical engineering, navigation and nautical astronomy, freehand drawing, and shorthand. The classes are under the immediate direction of Dr. EVERS, the author of several handbooks of science, who is aided by masters. The hours of attendance at the institute are from 7 P.M. to 9.15 P.M. on five evenings in every week of the session, and from 3.15 P.M. to 8 P.M. on Saturdays. Home lessons are likewise given, which require at least three hours' careful work in the course of a week, and the masters attend at appointed hours in order that they may be consulted by students who have experienced difficulties in their tasks. The fees are trifling in amount—indeed payment would appear to have been stipulated in order that the self-respect of the students might be never offended. Those who are engaged in the Elswick works pay 2s. 6d. as a registration fee for a single course, and 1s. 6d. extra for every additional course. The fees are double to those who are engaged elsewhere. "Premium apprentices" pay an additional fee of 1l., which, however, is returned to them after examinations. Their attendance is encouraged, as they are likely to be useful in keeping up a high standard. Free studentships are offered as rewards for any one engaged in the Elswick works who has attended a class regularly for two sessions and secured a first-class prize, and for all other students who have taken either three advanced first classes or a medal. Class books and drawing instruments are to be obtained by members at reduced prices. There is a general and reference library, which students who are not employed at Elswick can use by paying 1s. 6d. a quarter.

It is not surprising that two hundred and sixty students utilise the advantages which have been devised for their benefit by Sir WILLIAM ARMSTRONG'S firm. One hundred are from engineering works in the neighbourhood; the remainder belong to the Elswick works. The character of the instruction gives interest to the students' everyday toil, and it is found that, instead of becoming discontented, as happens elsewhere, "the students, who are most regular in their attendance and most earnest in their endeavours to benefit by the instruction, turn out to be the most efficient workmen." The foremen are selected from among them, and eventually they rise to higher positions. The drawing-office is recruited from apprentices attending classes. In fact, every student who is industrious, and who is possessed of natural or acquired ability, has a chance of gaining a position in the establishment, which, while advantageous in itself, is also a testimony of competency, and therefore (as the reputation of the Elswick works is world-wide) becomes a passport to a higher position elsewhere. The spirit in which the educational system is conducted cannot be better described than in the words of the partners by whom the classes have been established:—

It is our constant endeavour to make the classes as useful as possible, and we gladly avail ourselves of anything which experience teaches us will tend to this result. The tendency which is becoming more and more marked in the direction of increasing not only the difficulty of the examination in individual subjects, but also increasing the range of subjects in all competitive examination, is, we consider, an evil which should be carefully guarded against; for while offering a strong inducement to those who happen to possess exceptional powers of being crammed, it deters many who, although equally intelligent and equally gifted with all the qualities which combine to make the highest class of usefully intelligent men, are deterred from a feeling of inferiority in their powers of reception from entering into the competition. It does not always follow that those gifted with the power of absorbing a larger amount of information preparatory to an examination are the most practically useful in after-life; and, even were this the case, it is obvious that more general benefit will result from a larger

number of students thoroughly well grounded than a few brilliant ones obtained at the cost of deterring others from competing.

The extract contains advice which the Science and Art Department would do well to consider. There is a warning in it against the evil of that system of cramming which has already gained so much ascendancy in the schools as to become a power which "My Lords" must respect. Sir WILLIAM ARMSTRONG is not a man to allow his name to be attached to a document which has not been prepared with deliberation, and his remarks on the Department's teaching are in reality its condemnation.

One advantage of an experiment like that at Elswick is that there is a recognition of the condition of things in our time. Modern industry is an exemplification of the division of labour, and although some people may not admire that principle, they are compelled in spite of themselves to recognise it. The majority of those who are obliged to work are destined to take part in that division, and it is as well for them to accept the inevitable. It is only by doing so they can expect any advancement. They form so many units in a regiment of industry which must depend on united action for its existence. The description given by Paisley spinners of their business will, although not elegantly expressed, serve for a great many all over the country:—"Our manufacture is very much routine, and the workpeople occupying much the position of skilled labourers, without much opportunity of exercising their knowledge." The same idea was in Mr. WEDGWOOD'S mind when, in reply to a question from one of the Commissioners, he said, "All our working potters are piece-work men, or at least nine-tenths of them work piecework; and their work is so differentiated and so divided that I do not see how any other education than what such a workman gets in the seven years' apprenticeship could benefit him. A man makes plates all his lifetime from Monday morning to Saturday midday, simply laying a piece of clay in a mould, pressing it down, and taking it off again when dry enough to fettle. I do not see where any scientific education can be of service to him." There is as little use in blinking facts like these as in denying that rain falls for so many days in the course of a year in England. A system of technical education, to be of any use, must have a reference to the division of labour which controls the student's life. If he can in any way be aided to gain a step forward, so much the better, but it is not at all plain how this can be done unless there is an immediate connection between the school and workshop such as is found in Elswick. It seems to us that at the present time there is no experiment in education more worthy of attention than Sir WILLIAM ARMSTRONG'S.

We have no information about the cost of the Elswick classes, and probably it is only in exceptional cases that so much expense could be undergone. But we are convinced that at a great many places it would be possible for neighbouring firms to co-operate in a similar experiment. By a fortunate coincidence, as when Mr. SPARKES, of the Lambeth School, took up the subject of pottery, and Mr. RAWLE took up lace in Nottingham, it may be feasible to bring one of the Government schools into a practical relation with the local trade. In other places the experience has been different, and unless the local manufacturers insist on more than a nominal share in the management of the schools, what else is to be expected? The Stourbridge people declare that it is a farce to call their art school a school of design, and it appears that "the bulk of the most successful students of the school have been connected with the glass trade; but their success is to be attributed more to their own skill and industry and the genius and enterprise of their employers." In this case there is only one member of the committee who knows anything of the glass trade. The Department is too polite to offend the susceptibilities of the remainder, and, therefore, among all the examples which have been sent from South Kensington to Stourbridge there has not been one of any use to the glass decorator, unless MULREADY'S sketches are reckoned. The glass trade in other places is also in a position to cry out about the indifference of the authorities to its interest. When Sir CUNLIFFE OWEN was asked to explain how it was that foreign designers were employed by many of the most successful English firms, he pointed to glass as an example

of a trade which could flourish through native talent, adding, "The admirable glass made on a revival of old models by Messrs. POWELL, of Whitefriars, is, I think, traceable to South Kensington influence." But when we turn to Messrs. POWELL'S letter, we find that the students who seek employment with them as figure draughtsmen "have no practical knowledge of the art whatever, and are at a loss for some time in consequence. In their education all knowledge of the Gothic style seems to be ignored, and it is in this period of art that the grammar of stained glass must be learned." When it is found that Messrs. POWELL have to teach students the very grammar of their art, it is not easy to discern the boasted South Kensington influence. But in this, as in other cases, the authorities are not indisposed to look through the wrong end of the telescope on what has been the real training of students. The absence of special teaching, which was exemplified at Whitefriars, is so general that it may be considered one of the most marked characteristics of the schools. From all parts of the country letters came to the Commissioners pointing it out as if it were the principal defect. "The teaching wants to be more practical," Messrs. JONES & WILLIS write, "such as geometrical drawings, architectural plans, and section drawing from actual objects to different scales." "We think the instruction given in the science and art classes, in the subjects which concern our business—mechanical engineering—might," say Messrs. EASTON & ANDERSON, "be improved by being more practical." "Anything in the way of a practical gain," say Messrs. HORROCKS. "The encouragement of more practical teaching would," say CROSSES & WINKWORK, "very greatly influence and improve our manufactures." But truth becomes tiresome with iteration, and therefore we need not pursue this part of the subject.

The conclusion which may be drawn is that the country is at length wearied of a system of education which, while it professes to be practical, unfits the student for business. People ask that something "practical" should be substituted, and they are sanguine to suppose that it is merely necessary for a Government official to say the word and all must be done. But a remedy can only be found by means of a better organisation of employers. In many districts there are enough manufacturers to form a special school like the one at Elswick, and, until the trade jealousies are suspended and the management is made a local care as well as the foundation, technical education will remain what it is at present, an affair of masters rather than of students.

## THE DOULTON ART POTTERY.

IN the course of the examination of Mr. John Sparkes before the Royal Commission on Technical Instruction, the following evidence was given in respect of the pottery produced by Messrs. Doulton:—

Can you describe how the Lambeth art school took the peculiar bent of the instruction which is given there now?—Yes; a few months after I went to Lambeth in 1857 I had one student from the potteries, and I asked him to make some trials for me. I went to his master, but he was averse to doing anything. I then asked this man to give me clay and make certain trials for me in the kiln. By scratching the clay, by painting the clay with a stopping-out mixture, and dipping it afterwards in colour, and by making use of two or three clays, I saw there were capabilities in the material, but it was not for some years after that I was introduced to Mr. Doulton, and it was only in 1869 that we made some serious trials to get the clay decorated.

When you say "we," do you mean the school?—I mean Mr. Doulton and myself, and some of the students at the school at that time made some outlines, and they were rubbed in with cobalt and flux, and put through the kiln, and the result was encouraging. Then, for the International Exhibition of 1870, we made more trials; and soon the effort became more earnest still, and three or four students, a room being given them, went down to the pottery to manipulate the clay while it was wet from the wheel. I thought we could do more with it in that way. The result was that a great deal of attention was attracted by this attempt to decorate stoneware. Mr. Doulton was encouraged to take up the whole question, and from that time he provided rooms and a manager and all that was necessary to carry on the manufacture on a trade basis.

In his own works?—Yes, in his own works.

Do you consider that the work which is now being done at

Mr. Doulton's, and which has risen in the way that you have described, is altogether a new class of pottery, or is it simply a revival of something that has been done before?—In one sense it is a revival, because stoneware, which differs from every sort of pottery, was made in Germany in the fifteenth and sixteenth, and down to the eighteenth century; but, from another point of view, as to its decoration, we had to start upon entirely new lines, because the German pottery was fired with wood, and we were obliged to use coal, so that a piece of grey German pottery put through our kiln comes out the colour of a drain pipe. The colour of the Rhenish pottery is due to the fuel which is used.

Then you do not obtain the same colour as they obtain?—No, we were obliged to start on a new basis.

You had to do your ornamentation under those conditions?—I am speaking now of colours. The ornamentation was to a certain extent founded on the German, in this respect, that the old Germans could impress on to the pottery certain forms, such as you would get out of a seal, and that system we adopted, though we carefully avoided the German forms.

Then your designs are original?—Original, and never repeated.

You never do the same thing twice?—Unless it is a pair.

It follows from that, that you introduce a much larger variety of designs than those who repeat the same design upon a number of articles?—Yes, and my main object in making that stipulation was that we should keep the thing original and fresh, and avoid mechanical repetition of every kind, so that no piece is moulded; each piece is thrown and treated as an independent design.

Which involves this result, that both those who throw and those who decorate are to a certain extent artists, rather than artisans?—Yes.

I suppose it is correct to say that in the Lambeth school there is general art training precedent to the special training of the potter and decorator?—Yes, one of the conditions for a girl who enters the art pottery is, that she shall pass her second grade freehand examination at the art school or elsewhere.

That you consider indispensable?—Yes, certainly.

You do not think it possible to train a designer who shall not have previous knowledge and facility in the practice of art?—Of course it is possible to train designers, but in addition to their technical work, one would have to train their hands and eyes to drawing. I would also say that with regard to the girls who simply put on dots, and who colour, we take them from the national schools if they have passed their first grade examinations; but in many of those national schools they have also passed the second grade. If they have not done so they are sent to the art school to do it at once; and they get additional payment for each examination they pass.

You mean that they get additional pay in the factory?—Yes.

There is a strict alliance between the school and the factory therefore?—Yes.

What do you do for the works of Messrs. Doulton?—We take the girls, boys, men, and women, and give them this special training. The young girls who are engaged in dotting, or the lower forms of decorating stone ware, have a special teacher of elementary design; they are taught proportion, and the proper way of filling spaces, so as not to overcrowd, the value of diagonal lines, vertical lines, and so on, elementary design in short, and they do that every evening during the summer; while they are working in the art school at second grade subjects, they do it on two evenings a week. In this way a student may belong to both schools—the art school and the technical school. In the art school we do the work which is asked of us by this department; in the technical school we do that which is asked of us by the manufacturers.

Have you now described the whole of the work done by the technical school?—No, there is a class of higher design which is attended by the heads of rooms at the pottery and by the artists who paint and draw on the stoneware. That is carried on by Mr. Stannus. We assume that these persons can draw very well and design fairly, and then we tell them what not to do. The work is arranged in this way—on one day the teacher gives a lecture, for instance, on pottery and form, and shows that the form of a vase depends upon its proportions; that a vase designed for certain narrow proportions will not be good if it is simply drawn out; that a mere expansion of the thing will not do it, but that if it is this particular width it must have certain other lines in order to be harmonious. In the same way he would show what a moulding is, and how it would be decorated, and that is done, practically, with clay mouldings, which are then drawn on and dug out and decorated, and hung up in proper light and shade to show the value of the work. The students are taught the value and use of mouldings. Then proportion is dealt with from the architect's point of view, and the construction of ornament is carefully worked out. And so they get completely through the subject in the course of a year.

After pupils have passed through the second grade examination, for instance, and obtained employment in the factory, do

they continue their courses of instruction at the school?—They continue their courses for the most part at both schools, because the teaching is divided between the two. If a student wishes to go on with advanced anatomy or perspective, or architecture, he has to come to the art school; if he works at figure drawing or modelling or higher design, he has to go to the technical school. It sometimes happens that students do both.

You gave us certain figures just now; you mentioned that out of 250 working now in the art section of the works at Lambeth, all except some ten had passed through your school; what proportion of those remain in connection with the school after having graduated?—I cannot quite tell that.

A considerable proportion, should you say?—Very large.

More than half?—I should think 80 per cent.

Considerably more than half, at any rate?—Yes.

Do they remain permanently in the employ of the manufacturer?—Yes. There has been but one instance of a capable man having left. In the cases of those who go away, it is because their work is not good enough.

Can you tell us the exact number of workmen that come to study in the South Kensington Museum?—That is a very difficult question to answer. The number of visitors is very large.

I do not speak of the millions of visitors. I want to know the number of absolute workmen who come to South Kensington for the purpose of studying art as an incentive to their trade. Is it a number affecting the industries of the City of London?—I think so. When I find a man at Lambeth is repeating himself, and wants to do a new thing, I tell him to go to Kensington for a few days and look at certain sections. If he does come to the Museum, the firm will pay him for half his time; if he shows them that he has done his work at the Museum, and not simply taken a holiday elsewhere, they give him half his pay. They do that so as to encourage a constant reference to the Museum.

Is it the policy at Lambeth to vary the occupations of the work-people trained in your schools?—They can pass from the class of assistants to the class of artists, and they are very apt to develop in this direction if they have any natural gifts, because their drawing is kept up at the art school and their invention is stimulated in their daily work. By insisting on design we have a constant touchstone in the daily work by which we can ascertain whether a boy or a girl has invention.

## TESSERÆ.

### Whitworth Scholars.

J. H. REYNOLDS.

I THINK the history of the Whitworth scholars supplies an illustration of the injury that arises by taking men from workshop practice, in which they might have acquired greater efficiency if they had less general training. Some of them find occupation in teaching and in higher branches, in which their knowledge and capacity play an important part; but from inquiries I have made, there are many of them that prove to be practical failures, and from ceasing to take an interest in the practical work in which they have been engaged, they have found a very great difficulty in getting a livelihood. The history of the Whitworth scholars has been such as in many cases to prejudice the minds of practical men—employers more especially—against technical instruction. There is a great tendency on the part of the pupils who are successful in those scholarships to leave their occupations and go into teaching.

### The Apprenticeship System.

PROFESSOR AYRTON.

There must be some plan by which a man learns the manipulation of his trade; he must learn a good deal in the workshop which he cannot get at a school of applied science or in a technical school. I think possibly something like the present apprenticeship system should exist, but for a shorter number of years. The master at the present time gains by the apprenticeship system—the rise of pay that occurs the day that an apprentice ceases to be an apprentice shows the benefit the master has been deriving from the apprenticeship system. On the other hand, he has not been doing his duty all the time to the apprentice; he has not been giving him the instruction he ought to have been giving him. The conditions of trade prevent him doing it individually, and, therefore, as it is impossible for him to follow the old custom of giving personal instruction, he ought to help to provide the funds for technical colleges. I am inclined to think a considerable amount of good technical instruction could be given if a kind of technical school were attached to the large factories, such as there are in Sheffield and other places, the funds being provided by the masters. In this technical school attached to the factories, the workmen who might be compelled to come would not learn the manipu-

lation of their trade, but the application of science to their trade. The instructor would be receiving a salary from the masters of the works, and he would show workmen the practical application of scientific principles by taking the workmen about the works and explaining things in the works themselves.

#### **The South Kensington and Typical Museums.**

WILLIAM MORRIS.

It would be a great mistake to do anything that was really like breaking up the South Kensington collection. People who want to study the objects know that they are to be found there, and they can get at them with a certain amount of trouble. On the other hand, my experience in using the museum, and perhaps I have used it as much as any man living, is that the museum has got rather more things than it knows what to do with. I think that to break up a museum which has once been formed is a very great mistake. The things have a certain value in a great collection which they would not have in a small one; on the other hand, I do not think that a public museum need set itself to what is called collecting, or need try the sort of things that a private man with a long purse may do. At South Kensington the things are only wanted for educational purposes, and not as curiosities. You want types of good work, not a mere multiplication of articles. This typical museum in the metropolis should contain complete collections in all styles, and when an opportunity occurred for purchasing private collections, any gaps in the metropolitan collection should be filled up at the expense of the nation, but a good many things that were not wanted to fill up gaps in the metropolitan collection might be sent to the provinces. Then any superfluity in the metropolitan museum might also go to the provinces. I should like to say a word upon another point which has been mooted a great deal lately, and that is the circulation of articles belonging to South Kensington. I must confess I do not think it is a good plan. In the first place these things are extremely precious, and, if destroyed, can never be replaced. The risk in transit, though it may not be absolutely great, still is a risk, and should only be run when there is a strong necessity for it. There is another objection to the system of circulation of these objects. A museum, to be of any great use to those who are studying in it as artists or as designers, must be arranged in a permanent manner, so that one can come day after day and see the same thing; so that a man who is a lecturer can take his class to the museum and give a lecture on such and such an article, or that a manufacturer, like myself, can take a designer to the museum and say I want a thing done in such and such a way. Therefore I think it very much better that the provinces should have their own museums; if small ones, it does not matter so long as they are typical.

#### **The South Kensington Handbooks.**

SIR CUNLIFFE OWEN.

Some of the very best descriptive catalogues and standard works were prepared during Sir Henry Cole's administration. When he retired, it rather struck me that the cost of these catalogues being a couple of guineas in some cases, and a guinea in others, was more than could be spent by most people, and the Board authorised me to prepare a cheap edition of those books. We began by asking a man, very learned in art, Mr. William Maskell, if he would, with the consent of the authors of those standard works, such as Fortnum on "Majolica" and "Bronzes," and Nesbitt on "Glass," prepare a cheap edition of them. That consent was given, and these cheap editions have been issued at a shilling, under the editorship of Mr. Maskell, who has also been kind enough to write a standard work which came out in penny parts, called the "Industrial Arts." That has had an enormous sale, and has led the Department to issue shilling volumes on the "Industrial Arts of Spain," and on the "Industrial Arts of India." The money voted for catalogues is spent mostly in providing illustrations for those books. Once the illustrations are paid for, the book is launched on the world without our having any further responsibility about it. Messrs. Chapman & Hall, who have for a very long time been the agents of the Science and Art Department, undertake at all times to provide the South Kensington Museum, and all museums throughout the United Kingdom, with copies of these books at a shilling a volume, they taking all the risk of publication. The consequence is, that once the Department has paid the editor and the author for the book, and paid for the engravings, they are rid of all anxiety for the future. I can hardly say how many thousands of these books have been sold. I believe it is very nearly 100,000. I have had the gratification of frequently hearing employers say that they find these books being read in their workshops by the men in their meal hours. They are popular books among working-men, because they are fully illustrated, it being the object of the Department to bring before the people, as much as possible, illustrations of the various objects. I may mention that directly our book on the "Industrial Arts of India," by

Sir George Birdwood, C.S.I., was published, copies of it were bought up and a new lace was brought out at Nottingham called the Hindoo lace, the motive of which was taken from the book on the "Industrial Arts of India," if the design was not actually copied from it. The preparation of these books is going on at present.

#### **English Progress in Art.**

WALTER SMITH.

I think that we began in England entirely upon a wrong basis, a very unphilosophical principle, and we have been misled entirely by choosing that wrong principle. I was misled. I have made as many mistakes as anybody until very recently. I have only reproduced in my public work and teaching that which I was taught, and there was not one man who could be described as a thinker, or even as a great teacher amongst all the men who started the schools of design. I do not think there is one man amongst them who will live in history as an educator. We began wrong; we began by trying to teach people to draw the outline, for instance, of an object, which is the last thing that the eye sees; we began by teaching pupils to draw precisely that which does not exist, and that is the outline, and we have kept at it ever since. I think that the great advance in manufactures and taste, which there undoubtedly has been in recent years—a tremendous advance like a transformation, since I was a boy—is owing more to the revival of Gothic architecture than to anything else, and all the arts related to it, such as stone-carving, stained glasswork, ironwork, embroidery, tapestry, wood-carving, encaustic tiles, and all such work as that. The really strong element in the whole of the English industrial work has come from the architect's office; it has not come from the schools of art, and, comparing art now with what it was, I do not see such a very strong element of influence from the art schools in industrial design. I have seen in the shop windows and in private houses beautiful examples of the art our Saxon Christian forefathers would have delighted in; but in common honesty I think the schools of art have had very little indeed to do with it, not, for instance, so much as the architects have. But, as compared with the past, I think there is a transformation; I think that an Englishman to-day could no more be described as one of "a nation of shopkeepers" than a Frenchman; and that there has been an enormous advance made in a love of the beautiful and in good taste.

#### **The Education of the Artisan.**

PROFESSOR HUXLEY.

For myself, I look upon simple knowledge by itself as of far less importance to the artisan in his career in life than a number of other qualities. I do not say that knowledge is not an extremely good thing, but if a man is to make a good workman, or to do anything in practical life, you must give him an education which fits him for the conditions of life with which he has to deal, and you will not give him that education by filling his head with a number of intellectual abstractions, or even by giving him the largest acquaintance with scientific principles. And I think it is a profound mistake, considering the career to which the majority of artisans or persons in that class of life are necessarily bound, ever to take them out of the wholesome discipline of practical contact with the realities of life, for the mere sake of giving them a greater or less amount of knowledge. A man who is inclined to do so may always pick up knowledge, and he may do so at the same time that he is getting his education, in the highest sense of the word, out of his contact with the realities of his daily life; but if you make a bookworm of him, if you take him away from all that contact with reality and turn him back afterwards into it, he has lost touch of life. I speak with the greatest hesitation, because I have nothing to do with industrial pursuits; but I have had to do with mankind in many stations in life, and it seems to me that what is wanted in a foreman is a man of energy, punctuality, business habits, and power of dealing with men, all of which things are not to be got out of books or laboratory work. Those qualifications are the most essential qualifications in a foreman, and what you want besides in such a man is not book learning, but an intelligence sufficiently trained to be able to deal with new conditions, and an amount of knowledge sufficient to enable him to know where to go to find more if he wants it.

#### **Artistic Ability in England.**

JOHN SPARKES.

The natural capacity of the English is beyond that of any other country. In the last century we had Derby, Chelsea, Plymouth, Wedgwood, and many other art potteries established and flourishing without any Government subsidy, whereas Meissen, Sèvres, Frankenthal, and others did have either imperial or local subsidies. I should say that the taste shown in those works to which I have referred in this country was

at least equal to that which was shown abroad. At the end of the last century we had steel works at Wolverhampton, at which the steel ornaments in use at the French court were almost entirely made. Then we had certainly the greatest artists that had ever appeared in that age in Europe—Hogarth, Gainsborough, Reynolds, and many others—engravers far in advance of any that had appeared at that time in France or Germany. Owing, I think, to the absence of State systems of art education, we have developed men of more original artistic talent than any foreign countries. I would mention the names of Fred. Walker, Walter Crane, Caldecott, Herkomer—some of them artists in the largest sense, and men who have nearly all worked at industrial art in this country, and who have developed such a line of their own (for instance, Du Maurier and Keene in *Punch*, and Linley Sambourne and Kate Greenaway) that they are looked up to by the artists of Germany with wonder: they do not know how it comes that so much originality and technical power has been developed. Herkomer was trained in England entirely.

#### French and English Workmen.

LEON ARNOUX.

I think that the French are more facile in execution, and that the English have more patience. If you want a work well executed from a cartoon or an advanced sketch, I should rather have it executed by an Englishman than by a Frenchman; but if you want spirit and quickness in the execution I should say the Frenchman would be the superior: it is not something which comes from a particular disposition, but from the training they receive in the shops or the studios. The difference of the training in France is that they do a great deal more sketching than in England. In England, in the art schools, a vast amount of time has been wasted owing to the students being obliged or induced by their masters to make very highly-finished drawings. I speak now rather of schools in Staffordshire. I have seen pupils spending six or more months upon a chalk drawing, and wasting their time in making a beautiful copy which was to be sent to London for exhibition. A pupil, for instance, does a drawing from one of Grüner's lithographs. In the time that the pupil is doing it he might have done a hundred studies, and then he would have acquired a facility of sketching which would have done him a great deal more good; whereas when he had finished this copy he is no further advanced than before in regard to facility, besides getting the habit of being slow in execution.

#### Colourist Chemists in France.

ROBERT HAEFFELY.

In England there are very few chemists in print works; it is a very rare thing to have one. Generally the sampler is not a chemist, and this is one of the mistakes made in England. The sampler ought to be a chemist for this reason—that he has to know if certain colours are capable of being printed together. Some colours do not go well together; they precipitate, and so accidents may happen. All the managers in France are chemists, and they have under them one, two, three, or sometimes four young chemists. The managers in England are not trained at all in chemistry, whereas nearly all the continental managers, being generally Alsacians, are trained in chemistry, and the effects are more rational work, cheaper work, and more rational colours. The French managers, and the managers on the whole continent—namely, those of Germany, Russia, Austria, Spain, and Italy—are all, or nearly all, trained in Mulhouse. They are trained in Mulhouse in the laboratory, and most of them go through a practical apprenticeship of two years in one of the Mulhouse print works. It is pure chemistry for one and a half years, and the last half-year is specialised for calico printing.

#### Scientific Experts on the Continent.

J. LOTHIAN BELL, F.R.S.

In most European countries, certainly in Sweden, Belgium, Austria, Germany, and France (which pretty nearly exhausts the iron-making countries of Europe), the means of education are far more widely spread than they are in this country, and I think that has given rise to a class of scientific men of which we have not so many examples in this country—men who seem to devote their minds almost exclusively to industrial science. Professor Tunner has devoted a long life to metallurgical research. Then there are Professor Akerman in Stockholm, Grüner in Paris, and many others in Belgium, Germany, and elsewhere. In fact, this kind of instruction has been looked on for many years, I may say almost for centuries, with more favour abroad than it has been here. Going back as much as three hundred years ago, you have a very distinguished man writing on metallurgy in Germany, Agricola, a work so old as to be written in Latin. Then coming down to our own time you had Karsten, whom I met forty years ago in Berlin. All

these men devoted a considerable part of their scientific career to the investigation of matters connected with practical industry. I do not say that there are not such cases to be met with in England, but I think they are more frequently found abroad than they are with ourselves.

#### West Riding Designers.

FRANK CURZON.

I believe that the design of the country languishes solely from the utter want of preliminary culture on the part of the designers in literature as well as in art. I think that if those people were conversant with our poets, their taste would be more refined, and their designs better. I remember reading two papers to the Designers' Association, one on "Shakespeare as an Artist," and the other on "The Poetry of Colour," and it led to the most practical discussion by these designers—and they were only designers who were present. I believe we are suffering in England from the total absence of preliminary culture on the part of our designers. The West Riding Designers' Association met once a month for the purpose of having papers read bearing upon their immediate work, and discussing those papers. It should be extended; and I believe if it were it would do great service. The association is open to all engaged in the worsted, woollen, and cotton trades. They meet for the purpose I have stated—of discussing with each other the best mode of carrying out the object of design. They are imperfectly read men, with little knowledge of the harmony of colour, or the principles of art; they have therefore no means of checking their designs. They know little of our literature and of its wealth of suggestion for design, and they have but slightly realised the adaptation of natural forms to manufacture.

#### Limitation in Decoration.

J. H. POLLEN.

In decorative treatment we use natural forms altogether on abstract grounds, and we use them treated in an abstract fashion. Thus, the leaf of an acanthus, or the flower of a honeysuckle were, in Greek hands, of service without any reference to the fact that they were representations of actual leaves. Positive representations they really were not. A certain arrangement, viz., gracefulness of line and composition, made them useful, not by way of giving an idea of what an acanthus or a honeysuckle ought to be, but in order to decorate something else—a capital, a frieze, or the edge of a jar—things to which they have no necessary reference at all, but which they can set off by the intricacy of colour. Then, again, the colour of objects used in decoration has often no reference to those things, only to the things they decorate. Even the human frame has to be severely controlled, and its lines expressed in the most abstract way. The first principle, then, that distinguishes art in a decorative from art in a pictorial character is that of limitation. If we look at house decoration or engraving of plate, or other modern ornamental work, we are struck with the redundancy of it, or with the ill-judged attempts at finishing, rounding, shading, and so forth, as if the object were not to set off the thing decorated, but to give room for all the airs and graces of the artist. Decoration to be effective must, on the contrary, be limited. We cannot, except on occasions, do all that we might do in a picture. The leaf, scroll, fretwork, or whatever it is, has to be expressed as gravely, and with as little appearance of detail as its representation will admit of. The painter or engraver places himself within limits. What he does on a wall or a casket he does with all his power, but he has to remember that too much attention must not be attracted to his work. That work is the decoration or setting off of something else, not the sounding of its own trumpet.

#### HISTORICAL TABLETS IN EDINBURGH.

THE Plans and Works Sub-Committee of Edinburgh Town Council are engaged making up a list of places in the city that have become historical from their association with famous men, with the object of affixing to or near buildings bronze tablets with short inscriptions stating that so-and-so was born, lived, or died there. They have decided on affixing a tablet in Chambers Street as near as possible to the spot where stood the house in which Sir Walter Scott was born, and another to the house in Castle Street where the illustrious author resided. It is intended to mark the houses where Burns, Brougham, Hume, and others lived, and also the grave of Sir Walter Scott's father in Greyfriars Churchyard. They have also suggested that an obelisk should be erected in Greyfriars Churchyard where the bones of those who were interred in St. Giles's Cathedral, and which were removed at the time of the restoration of that edifice, are buried, near the spot in the churchyard where the Covenant was signed.

## NOTES AND COMMENTS.

THE handbooks which have been issued in connection with the Fisheries and Health Exhibitions do not appear to have been financially profitable, as it is proposed to dispense with similar publications in the forthcoming Exhibition of Inventions. It is precisely the kind of exhibition for which handbooks might be supposed to be a necessity. A substitute for them is to be found in prefaces to the various sections of the catalogue, which are to be written by men who are authorities on the subjects. Although catalogues were purchased by visitors to the two exhibitions, it was rare to see them used. We doubt if one person in a hundred will refer to the Inventions' catalogue, and probably not one in a thousand will have the energy to read the prefaces. In 1862, Baron MAROCHETTI's influential friends raised a little excitement about remarks which had been printed in a preface to the catalogue of the International Exhibition, which otherwise would have passed unnoticed by the public. But in spite of so good an advertisement, a reprint of the obnoxious preface was a failure. The majority of people go to exhibitions to be amused, and the managers have wisely resolved to procure additional attractions in the form of bandmen. Knowing this, is it not hard on men of science to be asked for essays, which are to be printed in order that by force of contrast the music and lighting may give more pleasure?

A BILL has been introduced by Mr. BROADHURST which proposes to enable leaseholders of houses and cottages to purchase the fee simple of their property. It applies to cases where at least twenty years are unexpired, and to life leases. The means to be adopted for ascertaining the value of property to the landlord are a jury of five persons, if the people interested prefer them to a county court judge, and a certificate that the purchase-money so determined has been paid into the court is to be taken as a conveyance. All questions of title are to be settled by the judge, as well as the distribution of the money among the rightful owners. As the tenant is supposed to set the machinery of the law in motion, the Bill proposes to make him liable for all costs in the county courts, unless in cases where the landlord or his representative makes an unfounded claim. Should there be appeals on questions of law or of fact, the costs are to be at the discretion of the court. Chapels and other buildings are comprised in the Bill, and it is also proposed to allow of the purchase of land in connection with a house where the area does not exceed three acres.

THE accounts have at length been made up of the exhibition of the paintings by M. MEISSONIER which was held during last summer in Paris. The total receipts amounted to 112,000 frs. But the expenses of insuring pictures, of which the value was about 20% a square inch, and carefully conveying them to and from the Rue de Sèze, with other charges, have been heavy, and have absorbed 70,000 frs. The amount available for charitable uses is therefore 42,000 frs. Of this sum M. MEISSONIER has asked that a fifth shall be divided among the poor of Poissy, near Paris, where he has a house, and the balance available for the night asylum, which gave rise to the exhibition, is accordingly 34,000 frs. The result is a testimony to the position which the painter holds in French art. His supremacy may be questioned, but what other artist could expect to attract so large a number of people to an exhibition for which one room afforded sufficient space?

THE variations in the amounts of tenders for the same work have often given rise to comments, and nothing appeared to be more uncertain than the position which a builder was to hold in a list when it was published. But tenders, like everything else, appear to be falling under the law of probability, and in the course of time all that surprise which made lists interesting reading to other people besides those concerned is likely to vanish. The new era has fitly commenced in New Zealand. Tenders were lately invited for the erection of a building in Christchurch for the Young Men's Christian Association, according to the designs of Mr. T. S. LAMBERT. Eighteen contractors applied for information, and their names were written at random in a book and numbered one to eighteen. Eighteen sealed

tenders duly arrived, and were brought before the authorities of the association. The amounts were placed opposite the names in the architect's book, and it was discovered that No. 1 in the book was the highest and No. 18 the lowest, the amounts of the remainder corresponding precisely with the order in which the names had been written. The coincidence was so remarkable that a declaration upon it was solemnly and sincerely made in the law courts. A New Zealand arithmetician has amused himself by applying the rule of permutations and combinations to the tenders; and he has calculated that the possibility of such a singular coincidence happening is as 1 to 6,402,373,705,728,000. That, of course, would be in an irregular place like England; but the random work of New Zealand is evidently the perfection of order. When QUETELET says that the actions of ordinary individuals are necessitated, he must have been thinking of the Southern Isles. Destiny has evidently resolved to make a model country there, and who can any longer wonder at the prophecy of a New Zealander seated on a broken arch of London Bridge sketching the ruins of St. Paul's? How he will wonder at the differences among the tenders when he studies one of our supplements!

IN the exhibition of one of the Belgian art clubs three drawings by M. KHNOPFF have been seen, which were intended to illustrate the book called "Le Vice suprême." One represented a nude figure of LÉONORA D'ESTE, and the face was made a striking portrait of Madame CARON, the opera singer. The drawing gave rise to plenty of discussion in Paris as well as Brussels, and it was not long before the lady heard of the liberty which had been taken. Madame CARON, accompanied by two of her friends, visited the exhibition and demanded that the drawing should be forthwith removed. The secretary declared that he had not the necessary power, and while the discussion was in progress M. KHNOPFF himself arrived on the scene. Madame CARON expressed her indignation, when at once the artist took the drawing from the frame and tore it into small pieces. The design, it appears, was most beautiful, and there is a work of art the less in Belgium; but the painter acted worthily in destroying a source of pain to a lady. The resemblance may have been entirely accidental.

It is reported in the Bristol papers that a London architect has offered a salary of five shillings a week to a first-class clerk of works if he will undertake the superintendence of a building near that city. If the story be true, the depression of trade must now at least have reached its lowest point. But it is more likely to have been an invention of one of the local humourists. Bristol has an abundance of architects, and they are naturally resentful when a commission finds its way to the metropolis. If the Clerks of Works' Association survives, there is now an opportunity to display the eloquence of the members.

A DISCOVERY has been communicated to the Archaeological Society of Geneva by M. TH. DUFOUR, which is an addition to the history of engraving. There is a rare work consisting of forty plates of memorable historic scenes, which was produced by two engravers belonging to Lyons, named JEAN PERRISSIN and JACQUES TORTOREL. It appeared in 1569-1570. Little or nothing was known about the artists until 1861, when researches were undertaken in Lyons by M. ALLET and others, but, like a good deal of provincial work, they were ignored in Paris, and M. DUPLESSIS, in his "History of Engraving," which appeared in 1880, maintained that there was still no trace of the artists. By a happy thought, M. DUFOUR was inspired to examine the records of Geneva, and he has ascertained that the forty plates were engraved and printed in that city. The wood-blocks were cut by JACQUES DE CHALLEUX after PERRISSIN's designs, whilst the copper-plates were the joint work of TORTOREL and PERRISSIN. Several members of the PERRISSIN family seem to have come from Lyons to Geneva, the first registered being CLAUDE, a printer in 1554. Another was possessed of a house at Aïre, in 1635, and it is remarkable that a few years ago in the neighbourhood M. RAVILLIOD was able to pick up one of the original wood-blocks. The subject is *The Assassination of the Duc de Guise* by POLTROT, in 1563.

## DECORATIVE PANELS .

BY E. PAGE TURNER.

## ILLUSTRATIONS.

SOMERHILL, KENT.

THIS illustration is a reproduction of a drawing by Mr. THOMAS H. WATSON, F.R.I.B.A., exhibited last year at the Royal Academy, showing additions for Sir J. GOLDSMID, Bart.

DECORATIVE PANELS.

THE two designs from drawings exhibited last year in the Royal Academy, represent respectively *Morning and Evening*, *Noon and Night*, and are by Mr. E. PAGE TURNER, 115, Charlotte Street, Fitzroy Square. They are intended to be painted in oils, and the height of each panel would be 5 feet. The form of the space containing each of the above subjects has been chosen with the view of bringing pictorial treatment into harmony with the arabesque decorations.

LLANSAINTFREAD CHURCH.

WE publish an interior view of this building, which is now in progress, from the designs of Mr. WILLIAMS, of Rhayader. An exterior view and description were published last week.

R.C. CHURCH AND PRESBYTERY, OUR LADY STAR OF THE SEA, STAITHES, YORKSHIRE.

THIS church and presbytery, now in course of erection for the Rev. W. S. SULLIVAN, occupies a prominent site on the road between the picturesque fishing village of Staithes and Dale House, on the new Middlesbrough and Whitby Railway. The church, including sanctuary, is 60 feet long and 22 feet broad, built of rock-faced stone, with ashlar stone dressings from Boulby Quarries. The roof is open timber, boarded and slated, the whole of the woodwork being yellow pine varnished. A bell turret in front contains carved bracket and canopy for statue, and a bell supplied by Messrs. VICKERS & SONS, of Sheffield. Windows will be glazed with cathedral glass. Adjoining the church will be the sacristy and presbytery. The latter contains dining-room, parlour, kitchen, and scullery on ground floor, and four bedrooms and bath-room on first floor, built of materials similar to the church.

The Right Rev. Monsignor WITHAM, of Lartington Hall, has been a liberal benefactor towards this undertaking, which is intended to supply the religious needs of a large fishing and rural population. The contract is being creditably carried out by Mr. THOMAS DICKINSON, builder, Saltburn, from plans prepared by Mr. MARTIN CARR, architect, Middlesbrough.

## THE TAIT MEMORIAL, EDINBURGH.

THE memorial to the late Archbishop Tait, which was undertaken by the Scottish Auxiliary Committee, has been completed. It consists of a colossal bust placed in a mural monument sixteen feet high, which is built into the eastern façade of the Medical School Buildings—this site having been chosen as that of the house formerly existing in Park Place in which the late Archbishop was born. The monument is designed in the Italian Renaissance of the "Cinque Cento" period, in harmony with the University Buildings, and consists of a pedestal over five feet high divided into three compartments, in the central one of which is the inscription. On the pedestal rest two columns of polished grey granite, with moulded bases and sculptured capitals in bronze. These support a full entablature, with sculptured panels in the frieze, displaying in the centre the mitre, crozier, and pastoral staff, and in the sides the Christian monogram I.H.S., and the crest and motto of the Archbishop's family. The entablature is surmounted by a segmental pediment, in the tympanum of which is a bronze panel in bas-relief, displaying two cherubs supporting an Italian shield bearing the arms of the See of Canterbury impaled with those of the Tait family, and the motto, "Pro rege et patria." The bust, which stands upon a moulded plinth over the pedestal, and is set within a semicircular panelled niche, between the columns already described, has been executed in bronze by Signor M. Raggi, London, the sculptor who executed the Beaconsfield Monument in Palace Yard, Westminster. The monument has been designed and executed under the direction of Dr. R. Rowand Anderson.

## THE ARCHITECTURAL ASSOCIATION.

THE tenth ordinary meeting of the Association was held on Friday evening, the 20th inst., Mr. C. R. Pink, vice-president, in the chair.

The following gentlemen were elected members:—Messrs. F. C. Grant, A. E. Taylor, R. O. Allsop, W. Wynhall, T. H. Hitchin, F. E. L. Harris, Stephen Box, H. S. Freeman, S. D. Robins, J. A. Morris, H. Phillips, and A. A. Cox.

A vote of thanks was awarded to Mr. Alfred Morrison in connection with the late visit.

The next visit was announced for Saturday (to-day), the 28th inst., to Houses at Collingham Gardens, Messrs. Ernest George & Peto, architects, and St. Paul's Schools, Kensington, Mr. Alfred Waterhouse, A.R.A., architect.

Mr. H. A. Gribble then read a paper on

## Roman Renaissance.

Mr. GRIBBLE, in the course of his paper, said:—The Basilica of St. Giovanni in Laterano (St. John Lateran) was founded by Constantine, at the instigation of St. Silvester, in the fourth century, who is said to have personally assisted in digging the foundations. The façade was designed by Alessandro Gallilei in 1734. The dimensions of this church are very large, consisting of five aisles, originally divided by stone or marble columns, which in the middle of the seventeenth century showed signs of weakness, and Borromini was then consulted. In the emergency he suggested the idea of encasing the columns and filling up every alternate arch with solid masonry, and facing the nave walls with pilasters of the composite order reaching from the floor to within a short distance of the ceiling. These solid piers were adorned with large niches of a very debased style of art, and in which were placed statues of the Apostles of colossal dimensions. This arrangement was finally carried out, and, if we could only overlook the shortcomings in the detail, I think we must confess that the architect displayed high ability by his manner of dealing with the awkward task placed before him. The great ornament of this church is the first chapel on the left-hand side, and known as the Corsini Chapel. It is square on plan, but having a large recess on each of the four sides, thus giving it the form of a Greek cross. The whole is surmounted by a cupola and adorned with paintings and marble of the most precious description.

The basilica of S. Maria Maggiore has experienced little or no alteration since the date it was founded, A.D. 352. I would call your attention to the Chapel of the Blessed Sacrament, commonly called the Sixtine Chapel. It was erected from the designs and under the direction of Cavalier Fontana (one of the most gifted architects of his time), and in my estimation this work is not equalled by anything else in the city of Rome. Its plan is most beautifully conceived, and its interior elevation and decorative treatment is certainly equal in merit to the plan. It is one mass of marble, gold, and fresco; so beautifully and tastefully arranged that the eye of the most educated artist could not be offended at it. I have the good fortune to possess both a plan and a section of it, which are also displayed in De Rossi's collection of chapels. There can exist no doubt but that this gem is the acme of perfection in the Renaissance style of architecture, and what every architect at the period would have done if his ability and the means at his disposal permitted it. Its *vis-à-vis* is that known as the Borghese. It is very similar in plan to the other, but not so rich in treatment. It is, nevertheless, an important adjunct to this ancient and magnificent church, where any young and enthusiastic disciple of architecture could take up his quarters for a couple of months, and well occupy his time by carefully delineating the multitude of precious works of art, both plastic and polychromic, which present themselves at every nook and corner within its sacred walls.

The plan of the churches during the sixteenth, seventeenth, and eighteenth centuries was governed in no small degree by the site upon which the church was to be built. If the ground would permit, it was a repetition on a small scale of St. Peter's; that is to say, the plan should be rectangular, the nave and transepts forming the cross, and the intersection being crowned by a dome, with the aisles utilised as chapels. If the site would not permit of a Latin cross plan, it was made either circular or octagonal, with all the outlying corners utilised as sacristies and offices, which, in most cases, were ingeniously dealt with, only we must bear in mind that it must have a cupola.

Rome being surrounded by a wall, the value of the land was increased to such an extent that the churches as a rule were packed in between a host of dwellings, in such a manner as to deprive us of forming an idea of what the external architecture of these churches might have been had circumstances permitted the architect the indulgence of an undisputed area. This misfortune may probably account for the conspicuous absence of side windows and the recourse to top lighting. If this assumption is correct, I must only repeat the old adage, that "out of evil comes good," for we must all admit that the

most satisfactory method of illuminating a large building is either by obtaining light from above or by some large opening over the entrance end. In the south of Europe this question is more easily disposed of than is possible in the City of London, in consequence of the brilliancy of the atmosphere with which the former is favoured. I do not hesitate to say that did our own St. Paul's, with its cupola exist in Southern Italy, the cartoons which are now being exhibited *in situ* as a suggestion for its future embellishment, would be fully seen and appreciated by the public, but that I fear (and I regret to say it as they are so beautiful) they will be lost for ever in a region of darkness. The usual method of covering the churches of Rome is to give them a waggon-headed ceiling of concrete, penetrated by smaller jack-vaults, a necessity caused by the clerestory windows. Now this arrangement of covering the nave gives the architect a considerable amount of responsibility and also anxiety in consequence of the immense lateral thrust exercised by the vault, for it must be remembered that the builders of this age had not the opportunity of using Portland cement, but were confined to the ordinary lime and pozzolana and thin brick in use at this date, about  $1\frac{1}{4}$  inch to  $1\frac{1}{2}$  inch thick; with these materials it was necessary that the vaulting should be of great thickness, so as to secure sufficient strength and stability.

In one case, where I had the privilege of going up into the roof, it gave me an opportunity of making an examination of the material itself, and I found it composed of coarsely-made concrete, 2 feet thick at the crown instead of 7 inches, which I have ventured to risk at the Oratory Church. Notwithstanding this great thickness of material there was a rent running the whole length of the nave, threatening the utter destruction of the building, and, to prevent such a catastrophe, the springing of the vault was secured by wrought-iron ties, 3 inches square on section.

The church of St. Ignazio, designed by Padre Oratio Grassi, and commenced 1626, is one of the most important in the city, and belongs to the order of Jesuits, having an internal length of 270 feet with a nave 60 feet wide and 100 feet high.

It is very simple, having the cross formed by the nave and transepts; in each aisle are three chapels, with two additional ones on each side of the sanctuary, all crowned with a small cupola. The pilasters in the nave are of the Corinthian order, fluted, and rest on the floor, not on pedestals; this arrangement answers exceedingly well in a church where fixed benches and pews are practically unknown. The nave, or what are sometimes called the clerestory arches, those which lead into the chapels, spring from detached columns, and, if I remember correctly, there are only two solitary instances of this arrangement among this vast collection of temples. The usual custom is to make the arches spring from imposts, the same as we see at St. Paul's Cathedral, but the architect of St. Ignatius did not do as Sir Christopher did, and cut away his architraves to give room for the arch, but, on the contrary, he kept them below the level of the necking of the capitals of the principal order. This, I think, is unfortunate, for if the arch was carried higher, the keystone could be so arranged as to apparently support the centre weight of the architrave. This church, though originally intended to be graced with a cupola, still remains without one, and, as a substitute, the area is covered with a vault of the section of a watch-glass, upon which is painted a perspective view of the interior of a dome, by Andrea Pozzo. This design and perspective drawing of the cupola is not the only relic in this church of the talent of Pozzo, as the high altar, and that in the left-hand transept, together with two others in the aisles, and also the decoration of the nave ceiling are the fruits of his ability.

The dome of St. Peter's is generally considered to be built on four arches, but in reality it is built on an irregular octagon, with the octagonal sides filled up solid; this arrangement, if the nave and aisles are sufficiently wide to allow a fair proportion to the arches, gives an appearance of great stability to the piers. In this arrangement the dome exceeds the width of the nave and transept walls, which are its natural abutments. I regret that during my stay in Rome I did not ascertain the mode of construction of this portion of the first church in the world, but I looked for a repetition of it in that city, and only discovered one instance of it, and that was in the church of St. Antonio della Nazione de Portoghesi, in which case it exceeds the width of the nave by about one-third. In the case of our own St. Paul's, the cupola is carried on eight arches, the springing of which above the piers has an exceedingly weak appearance, and conveys the idea to the spectator that it is unequal to the task of supporting the superincumbent weight; but on visiting this building lately, I found a number of workmen engaged in erecting a wooden framing of arched form, reducing the radius of the arches at the octagonal arches by about 8 feet (I presume by way of experiment). If this be the case I have no doubt but that it will succeed in giving an impression of strength where it badly wants it.

The church of the Gesu is close to the Corso, and a little north of the Capitoline Hill. It is similar in plan to St.

Ignazio, and was commenced in the year 1575, just one hundred years before our own St. Paul's, from the designs of Vignola, but the façade and cupola were carried out by another architect, Giacomo della Porta. The length of this building is about 200 feet, the width of the nave about 50 feet, and the height about 90 feet. The building as a whole is satisfactory both in proportion and in colour. The interior is rich in marble, and richer still in scagliola. One of the principal objects of attraction in this church is the altar of St. Ignatius, designed by the before-mentioned Andrea Pozzo, an engraving of which, two hundred years old, gives some idea of his work. It is chiefly of polished marbles of the rarest description, with a large central niche containing a statue of the saint, and adorned at the top with a marble group emblematical of the Holy Trinity. On each side of the altar are large allegorical groups, also in marble, one representing the *Triumph of Religion over Heresy* and the other *Christianity embraced by Barbarous Nations*. These works are by Messrs. Theodore & Le Gros.

St. Andrea della Valle, adjoining the relics of the Theatre of Pompey, is one of the best specimens of Roman churches. The designs were furnished by Olivieri in the year 1591, but finally carried out by Maderno, and the façade by somebody else. The plan of this church, together with its dimensions, are similar to that of the Brompton Oratory. It is a most attractive building, not only from its agreeable proportions, but also from the wealth of its decorative treatment, where the skill and ability of the most distinguished artists extant at the time were displayed. The fitting up of the first chapel on the right was entrusted to Fontana, and that adjoining it to Michel Angelo. The cupola is one of the most beautiful in Rome, and springs from a base similar to that of the Ignazio and the Gesu. The chapels adjoining the dome piers are contracted, an expedient no doubt to give strength to the piers supporting the cupola. The Oratory Church at Rome (Sta. Maria in Vallicella, better known as the Chiesa Nuova), and the Order of Oratorians were founded in the year 1575 by St. Philip Neri, just one hundred years before the commencement of the building of St. Paul's Cathedral. It measures 220 feet long and 50 feet broad, and is 98 feet high, and is one of the most highly decorated churches in the city, the architect being one Martino Lunghi. The arrangement of the plan is somewhat different to that usually adopted by the clergy at this period, for instead of the customary three large chapels on each side of the nave, there are five comparatively small ones, which suffer from want of light; and the chapels having windows on each side of the altar, give an air of insecurity, which effect is not experienced when the lighting is obtained from the ceiling or other lofty positions. The cupola of this church differs in form from that usually adopted in other churches, and is conspicuous by the absence of a drum, which form, singular to say, I proposed for the church at Brompton; but there is one point which I noticed in the dome piers of nearly every domical Roman church. It may seem too trivial to call for a remark, but at the same time trifles often contribute towards the success of a harmonious whole, and consequently I shall call your attention to it. The usual method adopted was to so plan the piers that they should possess the maximum of strength, and to do this pilasters were made exceedingly shallow, and the four corners of the square filled up with masonry, giving an octagonal splay. I look upon this arrangement as a misfortune, æsthetically speaking, for if the pilaster project only 12 inches or 9 inches, and the pendentives spring from plumb over the splayed angle, it allows for the visible arch supporting the cupola only the 12 inches or 9 inches, which conveys a sense of weakness and looks exceedingly mean. In the case of the Roman Oratory the architect discovered this when he arrived at the cornice, and instead of making the pendentives to spring from the octagonal corner, he commenced by starting from the inner angle, and so secured an arch of about 2 feet 6 inches deep, and which was his only way out of the difficulty. This building, like the others previously described, is very rich in marble veneering, and also in frescoes. The whole of the floor of nave, aisle, and chapels is of polished marble, inlaid with floral patterns. Should any student of architecture visit Rome and call at this church, I feel that he would be very graciously received by the reverend fathers, who would be only too pleased to render every information required. The residence of the clergy, including the Little Oratory and Library, were, I understand, confiscated to the Crown after the siege of Rome, about fifteen years since, and used by the authorities as the assize and other law courts. In fact, during my visit the clergy, in whose possession the Library had been for over three hundred years, had to ring a bell and obtain permission for me to see this portion of the building, and on entering I found certain individuals, who were appointed by the Government, making an inventory of the books and other treasures, for the purpose, I was told, of forming a national collection.

Mr. Gribble concluded his paper by remarks on the external architecture in Rome.

At the termination of the paper a vote of thanks was pro-

posed to Mr. Gribble by Mr. Blashill; this was seconded by Mr. Gotch, and supported by Mr. Julian and Mr. Blagrove.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the association was held in the Professional Hall on Monday. The president, Mr. G. Washington Browne, was in the chair. Mr. J. C. Watt read a paper on "The Poetic Aspects of Architecture." His object, he said, was not so much to pronounce any rhapsody upon the Classical examples which many ages had produced in considerable number as to elucidate the principles of beauty of which poetry was the verbal exponent, and art and architecture the visible embodiments. Those principles lay at the root of every outward manifestation of beauty, and forming, as they did, an essential part of the laws of nature, required certain interpreters. Those interpreters he found in the poet whose function was to express the ideal in words, the architect who put the same or relative idealistic conceptions into the poetry of form, and the sculptor and painter who exercised the same office in stone and colour. After glancing at the beginnings of architectural art and the poetic origin of many of its forms, the lecturer proceeded to draw a parallel between the mental conditions, the modes of work, and the productions of poetic and architectural genius at certain periods in the progress of culture, showing generally the coincidence of abruptness, brevity, or power in the earlier or tribal poets with monoliths, mounds, and kindred exhibitions of architectural conceptions. This parallel was continued to modern times when poets, on the one hand, rebelled against phantoms and allegorical figures, while the architect, on the other hand, about the same time embodied the same poetical figure in the wealth of garnishing which marked the Gothic style. The lecture was concluded by a reference to the characteristics and emotions common to poetry and architecture, particularly sublimity, symbolism, and association. After several gentlemen had spoken, a hearty vote of thanks was given to Mr. Watt.

### THE LIVERPOOL AUTUMN EXHIBITION.

THE report of Mr. Dyal, the curator, on the late exhibition of pictures held under the auspices of the Corporation of Liverpool, has been issued. The exhibition was opened on August 30, and closed on December 6, 1884, having been available to the public on eighty-four days. The total number of visitors (calculating each season-ticket holder as one), amounted to 105,774; these comprised 39,332 at 1s., 21,401 at 6d., 41,577 at 3d., and 3,464 holders of season tickets. In addition to these, nearly 10,000 pupils of schools of various denominations, as well as Board Schools, were admitted free. Out of 4,847 works of art contributed, 2,280 were exhibited, and of these 291 were sold, the catalogue prices of which amounted to 12,313*l.* 7*s.* 6*d.*, being the largest amount ever realised at any of the Corporation exhibitions.

The proposal of Mr. Ald. Samuelson to inaugurate the extension of the gallery by inviting the various art societies of the kingdom to occupy separate rooms in the building with representative exhibitions of their members' works was most cordially responded to, the result being a collection unique in character and importance. In consequence of the allocation of separate rooms to the various societies, and the very large number of works contributed to the general exhibition, the committee were placed in a position of great embarrassment owing to their inability from want of space to hang many works of great merit, which had therefore to be returned to the artists. The 2,280 pictures exhibited were contributed by 1,104 artists, and 20 per cent. of these found purchasers for their works.

An analysis of the catalogue prices of the works sold shows that they ranged from 1,500*l.* to 10*s.* 6*d.*, the latter sum being for an etching; 235 were under 50*l.* in value. This fact affords gratifying evidence that the exhibition holds out inducements to a large number of persons with moderate incomes to become possessors of works of art of acknowledged merit, and that by this means the public taste in art is becoming greatly improved. Experience in the working of the exhibitions shows that the public of the present day evince a more matured judgment in their purchases; and although many works of great artistic merit remain unsold, it is seldom from want of due appreciation of the ability shown in their production, but more frequently from want of interest in the subject, unsuitability as to size, or that the prices affixed place them beyond the reach of ordinary buyers.

The following pictures were purchased from the exhibition for the permanent collection, viz.:—*A New Light in the Harem*, by Mr. Fredk. Goodall, R.A. (1,500*l.*); *Rival Grandfathers*, by Mr. John R. Reid (800*l.*); *Dante and Beatrice*, by

Mr. Henry Holiday (735*l.*); *The Old Soldier*, by Mr. James S. Morland (160*l.*); *Golden Moments*, by Mr. Isaac Cooke (105*l.*); *Missed*, by Mr. Julius M. Price. A large drawing, by Mrs. Marie S. Stillman, entitled *Madonna Pietra Degli Scrovigni*, was also purchased by subscription and presented to the permanent collection, through Mr. Harold S. Rathbone. The exhibition also included the notable picture *Isabella and Lorenzo*, by Mr. J. E. Millais, R.A., purchased by the Corporation just prior to the opening.

In concluding his report, the curator has great pleasure in recording the fact that the large number of visitors to the gallery were unanimous in expressing the opinion that the exhibition was the finest display of contemporary art ever seen in the provinces. The various art journals and the press generally have spoken of it in the highest terms; it was visited by many artists of eminence, and by art connoisseurs and critics from all parts of the country, while the noble suite of rooms recently added by the splendid munificence of Sir Andrew B. Walker, the generous donor of the building, has elicited admiration from all classes of the community. The recent additions to the gallery, including as they do ample space for the reception of pictures, large and commodious rooms for unpacking and repacking, and the provision of a lift by which the pictures are taken direct to the exhibition rooms, have greatly facilitated the working of the exhibition. The galleries may now be regarded as the most complete of the kind in the kingdom, combining every convenience for the display of the permanent collection, as well as affording ample space for the autumn exhibitions or for other artistic purposes.

### THE COMMISSION ON HOUSING THE POOR.

AN unofficial report of the recommendations of the Royal Commission on the Homes of the Poor has somehow found its way to the *Standard*, and, although its accuracy has been denied, it may be true in substance and direction, while not entirely correct in every one of the details. One of the chief results of the inquiry, it will be found, is that the evils which have been exposed on several occasions arise not so much from actual deficiencies in the existing law as from the incapacity of some, and the unwillingness of other, local bodies to put the existing Acts into operation. For example, in the 35th section of the Sanitary Act the Commissioners believe ample powers may be found to remedy many of the grievances complained of. Many local authorities, it has been discovered, have allowed the section to remain a dead letter, not merely from indolence and the well-known hostility of interested persons, but from sheer ignorance of its existence. The innumerable Sanitary Acts are more than sufficient to confound and bewilder well-meaning vestrymen of ordinary intelligence. In order to get rid of this difficulty, it will most likely be proposed that all existing Sanitary Acts should be consolidated, and something like a clear and concise code laid before the local authorities.

The financial branch of the subject evoked much difference of opinion. Representatives from all parts of the country insisted that public loans should be obtained on more favourable terms, more especially where the security of rates, as well as of land and buildings, can be obtained. It was also suggested that the deposits in Post Office Savings Banks and other funds should be utilised for the erection of artisans' dwellings at a rate of interest a little above that allowed on the deposits by the Government. Others, again, notably the Treasury witnesses, urged that to employ the funds in this manner might involve serious losses to the State. In their report the Commissioners are disposed to take a middle view on these points. The inhibition by Parliament of advances at less than 4 per cent. by the Public Works Loan Commissioners for rebuilding workmen's dwellings is a rule which might be modified with advantage. There might be, for instance, a reduction of three-eighths per cent. on the present irreducible minimum of 3½ per cent. In point of fact, the Commissioners think money should be advanced at the lowest possible rate without involving loss to the National Exchequer, and that previous losses should not be brought into account. On the other hand, they decline to advise any such appropriation of deposits as was pressed upon them, disapproving of any special treatment of the funds derived by the State from special sources. The evidence brought before the Commission tended to show that Lord Shaftesbury's Labouring Classes' Dwellings Act of 1851 had altogether failed to achieve any useful purpose. This was mainly owing to the want of machinery to put it into operation with expedition. In London it might with much advantage be made metropolitan instead of parochial; compulsory powers might be given to the local authorities to purchase land by Provisional Order, and there should also be a special application of this Act to rural districts.

It was stated before the Commission that Sir Richard

Cross's Act had done more for the dwellings of the poor than any other enactment. The Amending Act of 1882, however, had not realised the hopes entertained respecting it; though it is only just to add that sufficient time has not yet elapsed to test its results. As to the bases of compensation and valuation, the Commissioners put forward some very important suggestions. The law at present does not recognise, as it should do, that overcrowding puts a premium upon property. Moreover, undue facilities are allowed for opposing the confirmation of a Provisional Order. These should be confined to the grounds that the area is not an unhealthy area, or that the site is not really required for the scheme. Even with these improvements it is thought that the system would still be very costly, compared with what is done in other countries.

Of more general interest to the country at large, and probably of profounder influence, would be the adoption of the Commissioners' suggestions for the simplification of the transfer of house property, and the general diminution of the legal expenses connected therewith. These proposals, perhaps, would have a most drastic influence in the way of reducing costs and clearing away the legal subtleties which obstruct the free acquisition of real property. The object of the Commissioners is to enable the wage-earning classes to obtain a good title to a small house or plot of land, without difficulty or unnecessary expenditure. For this purpose, it is suggested that the Metropolitan Board of Works in London, the local authorities for other urban sanitary districts, and the Courts of Quarter Sessions elsewhere, should each appoint a committee for the transfer of land and tenements, and to examine into questions of title, exacting in return a small charge, say, two per cent. on the purchase-money for every transfer. These titles, when completed, are to be inscribed in the Probate Register, or in the local County Court, for future use. It is hoped, with titles guaranteed in this way by the local authorities, owners would have no difficulty in obtaining advances from building societies.

The Commissioners will doubtless have some important observations to make on the subject of "betterment," and as to whether or not owners of adjoining property which has been increased in value in consequence of public improvements should pay more than their proportion of the rates of the town. Some amendment of the Settled Land Act will probably be proposed, so as to enable freeholders of an entailed estate to dispose more freely of sites, and authority may be sought to allow trust funds to be applied, under certain circumstances, on other than the "best terms" where the object is the erection of workmen's dwellings. Increased powers will also be proposed to be given to the ground landlords of leasehold premises to have effective control over sanitary improvements; and permission will be asked for the authorities to proceed against the simple fee-owners, or any other of those who hold intermediate interests between the owner and the actual occupier, for sanitary neglect. It is further strongly recommended that powers to impose penalties for the non-abatement of nuisances shall be more rigorously and generally applied; that it be made punishable to own property not in a habitable state; and that an owner should be held civilly liable for any death or sickness that may be caused through his neglect, and summary procedure be provided for the recovery of damages in such cases. The Commissioners are likewise in favour of transferring the duty of discovering illegally inhabited cellar-dwellings from the district surveyor to the local sanitary authority. Railway companies should be required to re-house persons displaced by demolitions, and should also be precluded from using the dwellings so substituted for any other purpose, without the consent of the local authority.

#### HULTON ABBEY.

A PAPER was read by Mr. Charles Lynam, architect, at the last meeting of the North Staffordshire Field Club, on this subject. In June last Mr. Lynam conducted an excursion of the members to the site of the abbey at Hulton, and subsequently to Keele Hall, where the "finds" recovered from the excavations on the site had been removed. Particulars of the discoveries were then published. The founder of the abbey, Henry of Audley, lived in the reigns of King John and Henry III. The remains of the abbey were discovered in an accidental manner last year by some labourers who were repairing defective drains coming across some stone coffin-lids. Further excavations revealed a portion of a wall of dressed stonework, and under the sanction of the Rev. W. Sneyd, on whose estate the site is, the work of uncovering the foundations has been persevered in until every wall of the former buildings has been met with to a greater or smaller extent. By means of plans, Mr. Lynam explained the character of the monastery, which was of the Cistercian order. The church must have been a noble building, measuring 203 feet in its extreme length, 107 feet across the transepts, 75 feet through the body, with a

chancel 27 feet wide and 46 feet long. The church was cruciform in shape, and consisted of nave with north and south aisles, transepts with two eastern chapels to each, chancel, and tower at the intersection of nave and transepts. The nave was of seven bays. Some of the remains of the church were as complete as when they formed integral parts of the actual buildings, disclosing a building at once vast, strong, skilful, and artistic, and fit to be ranked amongst the foremost of those erected by this order of Cistercian monks. Having described the character of the abbey buildings, including a chapter-house 43 feet east and west, and 32 feet north and south, Mr. Lynam said that coffins and human remains met with during the excavations had not been disturbed. The abbey was situated to the east of the Trent about 200 yards, and on rising ground. To the south of it was a stream which brought clear water from the hills to the east. This water was dammed, first for the purpose of working the corn mill, and was then carried round the south and west boundaries of the abbey, and afterwards ran into a series of fish-ponds, which supplied the monks with a considerable part of their diet; finally it emptied into the river Trent, on which there was another mill hard by.

Mr. A. Scrivener moved a vote of thanks to Mr. Lynam for his interesting paper, and for the unwearied exertions and attention he had displayed in connection with the excavations.

Mr. Spanton seconded the motion, which was warmly accorded.

Mr. Lynam acknowledged the vote, and proposed that the President be requested to write to the Rev. W. Sneyd asking that arrangements might be made for the admission of members of the club, and others interested in the archaeology of the district, to view the remains of the abbey; also asking Mr. Sneyd to consider whether he would not restore the bases of four of the chapter-house columns, which have been removed to Keele Hall.

Mr. A. Leech seconded the motion, which was carried.

## Bygones.

*"Antiquity after a time has the grace of novelty."*—HAZLITT.

#### THE CASE OF R. R. REINAGLE, R.A.

WE believe that no more than two cases have occurred of the expulsion of a member from the Royal Academy. In 1799 James Barry was first removed from his professorship of painting, and immediately afterwards was expelled on account of his attacks on his brother academicians. In 1848 Ramsay Richard Reinagle, a man of much less importance than Barry, was called upon to resign. It was alleged that a picture exhibited that year by him as his own was in reality the work of a young man, which he had purchased in a pawnbroker's for a couple of guineas. A prize-winner in the Art Union selected the painting from the exhibition, the price being 40s., and when he was informed that it was not a veritable work of Reinagle's, the case was brought before a committee of the Royal Academy. After an inquiry, Reinagle was expelled, but justice was tempered with mercy, for in consideration of his age and associations—his father was also an Academician and one of the earliest students—a pension was granted to him, which he enjoyed for fourteen years. He died in 1862 in his eighty-seventh year. Reinagle did not admit that his punishment was deserved, as will be seen from the following statement:—

In the year 1848 I sent a picture, among others, to the Academy exhibition; it was a marine picture, No. 41 in the catalogue; it was not signed by me, but it was called in the catalogue by my name. On May 12 I received a letter from the secretary, stating that a Mr. J. W. Yarnold asserted this picture was his production, to which he and another were ready to swear on oath, and requesting me to deny the truth of such a calumny. This I did, and said that four witnesses saw me paint it.

No notice was taken of this Mr. Yarnold's assertion by the Academy until a prizeholder in the Art Union, Mr. Bilbrough, having chosen the picture No. 41, when Mr. Yarnold applied to the Art Union authorities, and stated what he had before done to the Academy secretary, and then the Art Union secretary forwarded Yarnold's statements to the Academy, a copy of which was also sent to me by Mr. J. P. Knight, the secretary of the Academy, and at the same time a letter enclosing the same statement from the Art Union office. I replied to these by reasserting that I had painted the picture, that the entire surface picture was mine.

I received a letter from the Academy, dated July 26, 1848, informing me they had appointed a committee to investigate the

charges brought by Mr. Yarnold against me, and requiring to know when I should be prepared to rebut the aspersion cast upon me. I replied, August 15, by sending a protest against the right of the Academy assuming a judicial power, administering oaths, examining witnesses, &c., and stating that, having once given my word, I would not submit to be brought before any committee of my fellow academicians. I referred the council for any further explanation of my feelings to Sir Richard Westmacott. I also requested to be informed under what article of our laws or bylaws any portion of the body of the Royal Academy can establish themselves into a jurisprudent assembly. In this view I was confirmed by the advice of a fellow Academician, who also held Her Majesty's commission as a county magistrate. I had said also, in my letter of July 24, that I would rather resign my seat than be subjected to examinations such as that proposed, and after having once passed my word of honour.

On September 11 I was officially informed that the committee of investigation had reported the evidence to the general assembly, and it was resolved that Mr. Reinagle be requested to save the Royal Academy the necessity of further proceedings by resigning his diploma as a Royal Academician, as suggested by himself in his letter dated July 24, 1848. Another resolution was passed, the purport of which was to inform me that, notwithstanding my declining to attend the meeting of the committee of investigation, the report, together with the evidence, is open to Mr. Reinagle's inspection, on application to the secretary. On September 13 I resigned, and on October 19 received the notification of its being accepted unanimously by those who were present, several academicians not attending the meeting. The proceedings having been presented to the Queen for her sign manual, were rendered complete; and at the next general meeting in November Mr. Westmacott was elected into my place, the son of the chairman of the committee of investigation.

I now come to the statement of facts, which I perhaps imprudently refused to state to the committee. My excuse is that I felt so indignant at being summoned, as it were, face to face with brokers and Mr. Yarnold, who is one of the class of painters who produce imitative pictures, as I shall prove eventually, that my feelings prompted me to adhere proudly to my first assertion, which was and is the truth.

A pupil of mine, Mr. Blackall, having seen a certain picture in a state of dead colour, or little more, in the shop of Mr. Pike, the broker, in Mary Street, Hampstead Road, asked me to come and look at it. His idea was that it might be painted into a capital picture. It was bought by him for three pounds. I then began to paint upon it, giving lessons upon it to my pupil, Mr. Rogers, of Birmingham, then resident with me. Mr. Blackall also saw me painting it, and Signor Fabroni. I painted every part of the surface of the picture, and, excepting the design of the outline, nothing whatever remained of the first painting on the canvas; and whoever may have painted first upon it had little more claim to be the author of the picture than the workman who covered the canvas with the priming. Having nearly finished this picture, I had business at Exeter, and took it with me to finish. There I worked again at it in the presence of Mr. J. Saywell, a gentleman well known there for many years. The picture was exhibited there, and marked in the catalogue by my name and that of Yarnold, as I was unwilling to disguise the fact of another hand having been concerned in its production, however much it was my own work. When it was returned to town, the owner of the picture was assured that the name of Yarnold was a fictitious one used by a poor artist who painted cheap pictures for the brokers. This it was that led to the picture being sent to the Academy with no other name than mine, as indeed it was entitled to bear alone.

From the evidence of this Mr. Yarnold—who under that name, which Heaven only knows is a real one now, was allowed to swear to the picture being his—I have been expelled the Academy, although I can prove that a certain picture of precisely the same subject reversed was in the hands of a pawnbroker at 234 Strand, with the name of Stanfield upon it, done to imitate the signature of that academician, which picture this Mr. Yarnold also claims as his work, and which, during the inquiry, I requested Mr. Stanfield to examine. I need not comment upon the veracity of an artist who does these things.

But in granting that the under picture was painted by a person named J. W. Yarnold, and admitting that I should have mentioned this in some way, which I sincerely regret not having done, what crime have I committed that should heap upon me so heavy and ruinous a punishment—a punishment which, on my conscience, I have never deserved, nor which can be supported by impartial justice? I have suffered severely from having stood my ground upon the sacredness of my word alone.

Reinagle was not satisfied with explaining his innocence, but afterwards endeavoured to prove that the academicians were the last people to be squeamish about an artist passing

off the work of other hands as his own. His narrative of his experience as an assistant and witness will be published next week.

## ARCHITECTURAL COMPETITIONS.

ON Monday evening Mr. Cole A. Adams read a paper at a meeting of the Leeds and Yorkshire Architectural Society on the subject of "Architectural Competitions." Mr. Adams began by calling attention to the importance attached to competition in England in all departments of life, and it was not surprising that buildings were not exempted. He then entered on architectural competitions, and showed that it would be better if architects endeavoured to reform the system. This could only be done by architects drawing closer together for mutual protection. Committees are incompetent to decide on the merits of rival designs. Experience has shown that it is rare to find a competition conducted fairly and honourably. So many interests are involved, and the love of exercising patronage is pleasant to the human breast; then the struggle for practice, and the desire to win a prize, no matter how, will turn men from the path of strict rectitude. If a man be determined to win, his best course will be to make the most showy design he can regardless of cost, to cultivate friends, to get the best information, and to open his purse-strings. Men who have acted differently are sure to complain; but let the winner keep judicious silence, and the matter will blow over. Competition is, on the whole, the fairest way to insure the best results and to decide between rival claims for employment; but in nine cases out of ten a better building would be erected and a world of heartburning would be saved by selecting a single architect who is possessed of the good opinion of the public and the profession. Mr. Cole Adams next described some of the evils that followed the selection of designs by competition, and said:—

It sometimes happens that a work or design of genius takes the first prize. The author turns out to be a young man, fresh from an architect's office, clever, accomplished, and artistic, but who has had very little practical experience. This is no unusual case. But is such a man quite the one to employ in the expenditure of public money? By the conditions of competition he ought to be employed, but building has to be studied as well as architectural draughtsmanship; and therefore, if our young architect succeeds in carrying out the building, he will add much to his store of information. Is there not a great risk that the public will have to pay for his education in the blunders he may make? Architects, after a few years' practice, know the pitfalls—the variations in estimates, the extraordinary proportion that omissions bear to extras, and how much knowledge is necessary to insure good building. How can a young man, fresh from an office, ignorant of all the ins and outs of building operations, inexperienced in the practical detail of his work, be expected to carry out, as it should be carried out, any building of importance? And yet what is to be done? Our young architect has fulfilled the advertised conditions, and in all fairness should have the job. With the ambition of youth he will rush in where angels fear to tread: somehow or other he will get through. By some good fortune he secures a good clerk of works, who is virtually the resident architect, and his quantity surveyor has written his specifications and thrown all responsibility on the contractor, and the solicitors have made the contract sufficiently binding to protect their client. Maybe all will go fairly well; but were the commission alluded to to extend their inquiries into such matters, what stories might not be told to harrow up our souls! In one case a competent man has been secured; in the other, a draughtsman, a maker of pretty designs, but incompetent in the most important details of his work—in fact, only half-educated. Better that such an one should bear the yoke in his youth than dress himself in borrowed plumes, bringing, by ignorance of his work, a stigma upon a profession which, from one cause or another, is ever having the blunders of incompetency cast upon it. Much of this obloquy arises from the rash and indiscriminate exercise of the competition system.

Then other results follow competitions. The local man—and I use the term in no invidious sense just now—flatters himself, may be, that he is above all things practical, but fears that he is rather backward in making a showy set of drawings. These he knows he can buy. He looks about him, consults a friend, or may be his professional journal, and then, lo! behold one day, seated in his office is a strange face, which in a day or so, as mysteriously as he came, disappears. A few weeks after a long row of drawings arrives, which makes the office excited and busy, and in due course a package is delivered to the place appointed by the promoters for sending in designs. The whole affair is so mysterious as to suggest ghostly interference. The winner of the prize is made public, and the local man is found to be he. Those who inspect the design are amazed at the cleverness of it—cannot think how Mr. — could make it, knowing what buildings he had before erected. Then there are

various rumours afloat, and mutterings deep and low, but our local friend cares for none of these signs. He knows perfectly well what he is about. In course of time the stool in his office is again occupied by the strange face. It is whispered, too, that he of the strange face is closeted daily with Mr. —, and then as mysteriously as he came he again disappears. Anon other parcels arrive by train or post, and the building is started. Mr. —'s balance is slightly reduced at his bank, the ghost is seen no more, but Mr. —'s fame is established.

If the ghosts would but tell the secrets of their prison-house, the skeletons unlock the doors and come out of their respective cupboards, what a howling, shrieking, and general confusion would ensue. Fortunately, perhaps, ghosts only walk the earth at night, when honest folk are in bed and asleep; and the skeletons have not got hold of the keys, or such discoveries would be made and such scandals be disclosed as would afford something more than a nine days' wonder. Better, on the whole, that the ghosts and skeletons should keep themselves to themselves.

While on the subject of ghosts and skeletons, let me disclose a secret—a plot which has borne some fruit, and which was devised and brought to a successful issue. The plot was against the demons of injustice—bribery, corruption, ignorance, stupidity, and all other like evils and their attendant results. Bear with me while I tell you the story of a movement and how it originated, which has some interest attached to it, and has been far-reaching in its results, though not achieving that full measure of success which its originators hoped for. On January 13 in the year 1880, a few architects met in the upper room of a house in the city of Westminster. These men were members of a small club or society for the exchange of professional books and ideas. One of the members had brought before the meeting a paper on architectural competitions, treating of the generally unfair way in which they were conducted. The author insisted upon the necessity of insuring justice by having a competent assessor. The meeting with enthusiasm endorsed the view, and swore "that the great race of architects should suffer wrong no more." A committee was appointed, consisting of the members of the little club and a few others. Ways and means were discussed, and it was determined to canvass the profession as to their views.

Mr. Street gave his advice and name to the movement, and that movement, you have doubtless guessed already, was for the purpose of obtaining one or more professional assessors of established reputation for every public architectural competition. The number who signed the memorial, presented by that great architect who now lies buried in the Abbey at Westminster, far exceeded what the promoters of the movement expected. Mr. Whichcord (who died recently) was President of the Institute when Mr. Street presented the memorial, and expressed his astonishment that so many architects were in existence. Gentlemen, all of you know about this movement. The outcome of the memorial was the appointment of the Competitions Committee by the President and Council of the Institute, and the recent issue of the form of agreement to architects throughout the United Kingdom. The number who have signed this undertaking is upwards of 1,420. I venture to say—and I have had more opportunities than many of judging—that, on the whole, much good has been accomplished and a larger measure of justice secured to the profession.

If I harp somewhat longer on this theme than to many is desirable, bear with me a little. From the first I have taken an active part in the movement, and the labour of accomplishing even what has been accomplished has not been light; and so you must concede something to a man with a hobby, and forgive any little tendency to magnify results and to degenerate into prosiness.

The principle upon which the memorialists insist is that in every public architectural competition a competent assessor shall be appointed in the interests of the profession and of the public also. I am as fully persuaded of the justice of this position as I was when the invitation was first issued to the profession to join in assisting upon it.

I wish some one with the ability to do it and the time at his disposal would tabulate the competitions which have recently taken place, and their mode of procedure and results. Such statistics would be most useful and instructive.

Now, let me tell you briefly what the Competitions Committee have done. Every architect in practice whose name and address we could obtain has been asked to sign the agreement as to the assessor, and we have upwards of 1,420 signatures. We have local honorary secretaries fifty-eight in number in all the chief centres and districts of the United Kingdom, whose duties consist in keeping the committee informed of what competitions are promoted in their respective neighbourhoods, and otherwise assisting the cause. Directly we hear that a competition has been inaugurated or is in contemplation, we send a circular letter to the promoters of the competition, explaining the views of the signees, and enclosing a copy of the "suggestions" issued by the Royal Institute of British Architects, and a list of those who have signed the

agreement. In the circular we state that we do not recommend the "dual" competition in works under 20,000*l.*, and we purpose making another suggestion to the effect that a circular should be sent to all competitors in a competition, by the promoters, embracing the replies sent to any inquirers up to a certain date, so that all may be placed on the same footing. The great thing of course is to get at promoters before they issue their instructions; and not long ago we endeavoured to meet this by a letter addressed to the editors of the principal London papers explaining the position architects had taken up, and, in addition to this, a circular letter has been sent to all the mayors and other public functionaries throughout the United Kingdom to the same effect. You will therefore see that strenuous efforts have been, and are being made by the Competitions Committee, of which one of your body, Mr. J. Barlow Fraser, is a most active and energetic member. I may add that the Competitions Committee decline to advise or suggest who should be the assessors in any competition. Up to the present time, of the number of promoters applied to, some 25 per cent. have appointed an assessor, so I do not think there is any reason to be discouraged. Reform is not to be effected in a short time, and the seed sown will bear fruit some day. One thing to me is a subject of disappointment, and, I confess, of surprise. Of those who signed the memorial, a very large proportion have, from some cause or other, refused or neglected to sign and support the very agreement they prayed might be set on foot. That is a position I cannot understand or appreciate. I was sanguine that all who signed the memorial would have supported this movement for securing justice, but I very much fear that some hold aloof hoping to secure an advantage thereby, and to go in for the gambling with reduced odds against them. Others refuse to sign on the ground that it savours of trades-unionism.

Mr. Adams then went on to speak of the working of the assessor principle, and said it was to be feared that it had sometimes failed from a want of judicial power. To expect infallibility was to expect too much. But was not an expert likely to be nearer the truth than a body of laymen? The appointment was proposed to be restricted to public competitions. In conclusion, a series of propositions was proposed as the result of architectural competitions.

In the discussion which followed, Mr. Birchall, Mr. Hill, Mr. Fraser, Mr. Connon, and Mr. Bulmer took part, and it was said that the dual system recommended by the Institute entailed enormous work on architects for the benefit of the assessors. Mr. Adams, in replying, said that the dual system was not proposed for works under 20,000*l.*, and he begged his auditors to give the assessor principle fair play.

## THE CASTLE OF GLASGOW.

A PAPER on the castle of Glasgow was read by Mr. George MacGregor at last week's meeting of the Glasgow Architectural Society. It was said that the beginnings of the castle of Glasgow were unknown, though it was probable that its growth had been gradual as the wealth and power of the bishops increased. The first mention of it was in the *Chartularium Glasguense*, under date 1228. In 1300 it was occupied by a strong body of English troops, who were in that year defeated by Wallace in what was known as the Battle of the Bell o' the Brae in the High Street. At that time it is supposed to have been a plain four-storeyed structure built of hewn stone, the walls pierced by several narrow windows, and surmounted by battlements. In all likelihood this building was then, as it was two centuries later, surrounded by a fosse, with drawbridge and portcullis. During the episcopate of Bishop Cameron, about the year 1438, a great tower was erected immediately to the south-west of the castle, and was a quadrangular building with embattled walls and crow-stepped gables. Archbishop Beaton, between 1508 and 1522, enclosed the whole within a wall 15 feet high, with a bastion at the north-western corner, and otherwise greatly strengthened the castle, which was now being regarded as one of the citadels of the west country. In the month of February 1515, Mure of Caldwell, one of the barons in league against the Regent Albany, stormed and carried the castle with artillery, but the Regent quickly levied troops and, after a short struggle, ejected Mure. The archbishop raised an action against the Lords of Council against Mure, who was ordained to return all the articles abstracted or pay their value, and to hand to the pursuer the sum of 200*l.* Scots in name of damage done to the structure during the siege. Two years later it was taken by the Earl of Lennox. During the episcopate of Archbishop Dunbar, a large stone gateway was erected at the portion of the wall near the entrance to the cathedral yard. In 1544, during the minority troubles of Queen Mary, the Earl of Lennox placed a garrison in the castle of Glasgow, and retired with the rest of his forces to Dumbarton. The Regent Arran marched to the western city, and for nine

days bombarded the castle with brass guns. On the tenth day the defenders surrendered on condition of quarter, but they were afterwards ruthlessly put to the sword, only two of them escaping. Having traced the part which the castle played in the Reformation movements in the west of Scotland, he detailed several other sieges to which it had been subjected, and quoted an entry from the Privy Council Registers of date March 20, 1573-74, in which "The Castell and Stepill of Glasgow" were spoken of as "ane of the principall keyis of the cuntrie." After this period the castle fell gradually into a decayed state, and about the middle of last century it was regarded as a quarry where the builders in the city could obtain stones for nothing. At last, in 1791, the ruins were entirely removed to make room for the Royal Infirmary, the Exchequer and the Court of Chancery having given the directors of that institution a grant of the ground. Of the old castle but few relics now remained. In the possession of the Glasgow Archæological Society was a walnut panel belonging to the internal decorations, presented to the Society in 1859 by the late Mr. Gabriel Neil; in the porch of St. Joseph's Roman Catholic Chapel, North Woodside Road, was a sculptured stone with the arms of Archbishop Beaton, which had evidently been carted away from the ruins a century ago, and which had been got by the clergy of St. Joseph's in a house they took down for the purpose of extending their chapel-house. For over a century two stones, exhibiting the royal arms and monogram of James V., and the paternal and episcopal arms of Archbishop Dunbar, which had formerly been placed in the gatehouse, were in the wall of a tenement in High Street; but a few years ago these were obtained by Sir William Dunbar, to build into the wall of his Wigtownshire residence. The paper was illustrated by a ground plan of the castle and its surroundings.

### GLASGOW ARCHITECTURAL ASSOCIATION.

THE last lecture of the session has been delivered by Mr. W. Paton Buchan, S.E., his subject being "Internal Plumber Work." There was a good attendance of members, and the Vice-President occupied the chair. Plumber work, Mr. Buchan said, was much less understood or lectured upon than the kindred subject of drains, about which, unfortunately, almost every one considers himself competent to judge; still, information by means of books, &c., was spreading, and slowly but surely ousting mere custom and rule of thumb. The appliances embraced within the paper's scope, and examined separately, comprised baths, basins and sinks, hot-water tanks, boilers and pipes, and finally water-closets. The important point of the water-supply service was considered, not only of cities such as Glasgow, where the drinking-water is obtained direct from the main, but also of situations where an intermittent supply necessitates cisterns, in which case special precautions must be taken to prevent contamination, and these the lecturer fully described. But even while in these latter circumstances he was fully alive to the reasonableness of waste-preventing apparatus being insisted upon by the various water companies, still the ordinary water-closet flush of two or three gallons was in his opinion quite insufficient. Stop-cocks, it was enforced, should be fitted within the house, readily accessible to the occupants, for at once turning off the supply in the event of a burst or overflow, while much time and trouble would be saved to the plumber called in for repairs if a notice of the exact position of the external stop-cock were affixed to the wall. The long-wished-for sanitary regulations now proposed by the Glasgow Corporation were almost without exception commended. These, if decided upon, will place Glasgow among the foremost in this respect. The compulsory use of the smoke test which these regulations propose Mr. Buchan considered good, as the best system of testing drains, and one which he himself had used for several years before its general employment.

Numerous illustrative diagrams were exhibited, as well as models, fittings, and some specimens of dangerously defective traps taken from old buildings. After remarks from various members, a hearty vote of thanks was awarded to Mr. Buchan.

### THE DUBLIN MUSEUM.

ON Tuesday Earl Spencer was present at the distribution of prizes to the students of the Metropolitan School of Art, Dublin, and, in the course of His Excellency's address, the following allusion was made to the new museum:—Since last year I am happy to think that we have at last seen the ground broken for this museum which we have all so longed for in this city. I have often before, when I was Lord-Lieutenant in former years, said how much I desired that a large museum in Dublin should be built and established. I have pointed out the great advantage it would be to all lovers of art in this country, and to the students in art who belong to Dublin

and to this school. I am happy to think that at last we have been able to realise our desires and our hopes. I must also congratulate Ireland and Dublin on the fact that among all the competitors for the designs the successful competitor was Mr. Deane, a distinguished architect belonging to this country. From what I have seen, the building that will be erected from his design will be a great addition to the architectural ornament of this city. When the museum is built, you in Dublin will have a very remarkable group of buildings and institutions collected together here about Leinster House. You will have in the centre those societies which have done so much to promote science and art, agriculture, and the fine arts in Ireland, not only by their meetings but by their teaching, and by the example which they set for the promotion of these objects. They are there located in one of the finest houses of which Dublin can boast—a house which does honour to the architectural taste of its former owners, the descendants of whom I am happy to think will shine in their liberality towards the arts in this country. On each side of this society will be grouped buildings and institutions to promote art in this country. You will have a magnificent public library, close to that you will have the Museum of Art, and beyond that you will have the National Gallery. I will venture to say that in that National Gallery there will be specimens of the finest sculpture to be found in the world, and you will have every year increasing in numbers admirable specimens of both the ancient and modern art of painting. On the other side of the Leinster House you will have the National History Museum, and above all, that new Museum of Art which has been referred to here so often. That group of institutions and buildings will be one of which any city in Europe may be proud. I believe that the people of Ireland and of Dublin are worthy of these institutions, and that they will avail themselves of the opportunities that they will present for the development of their taste and their intellect, and that a great impetus may be thus given to those who desire to acquire a knowledge of art in the professions to which they belong.

### ARCHÆOLOGY.

**The Jamaica Coffee House.**—The demolition has commenced of the celebrated old coffee-house called the Jamaica Coffee House, in St. Michael's Alley, Cornhill. This coffee-house was for many years the head-quarters of those who represented the shipping interest. The old lockers still remain which were used by the City magnates of a past age. A new and handsome building is about to be erected on the site, from the designs of Mr. Banister Fletcher, the accepted contract being 7,173*l*. A record of the past will be kept by painted windows, representing old scenes which have taken place within its walls, and the arms of the old City merchants. The rooms will be furnished with the old mahogany tables and chairs on which have sat Sir Thomas Gresham and other celebrities of a former age.

### CHURCH BUILDING AND RESTORATION.

**Christ Church, Stone, Staffordshire.**—This church was reopened with a dedication service on Saturday last, the 21st inst., after extensive additions and alterations. The church, which is a plain brick structure, was built about forty years ago. The old chancel, which was but 20 feet by 13 feet 9 inches, has now been removed, as also the former vestry, which was small and mean, and, having no external door, was entered from the church only. A great portion of the east wall of the nave has also been taken down. All the old pews have been cleared out, and the organ has been removed from the gallery. A new chancel, 30 feet long by 20 feet wide, has been built. This is 25 feet 6 inches high internally, and some 33 feet to the ridge of roof externally. It has a polygonal apse, five of the sides having windows, the heads of which are filled with well-executed tracery. The chancel roof, which has been much admired by those who have seen it, is composed of strongly-framed principals, with curved ribs rising from the walls some feet below the cornice. Those which rise from the angles of the apse are grouped at top around a moulded pendant, from which also springs a curved longitudinal central rib: the spandrels between the principal timbers and the curved ribs are filled with pierced tracery panels. The whole is divided and subdivided into compartments and panels by the principals, and by moulded ribs. There is also immediately above the cornice a series of curved braces, which is continuous along each side and round the apse. The organ is to be re-erected in a spacious organ-chamber, which has been built on the north side of the chancel, into which and the nave there are wide and lofty arches for the double front with which the organ is to be rearranged. The new vestry is upon the south side of chancel, and is commodious and lofty. The nave and western gallery

have been entirely re-seated with substantial and very comfortable seats of pitch pine, the seats in the nave being arranged in four lines with a central and side aisles; those in the gallery now face eastwards, and not, as formerly, partly north and south. In the chancel are handsome oak choir-benches with panelled fronts, an oak prayer-desk, and on both the north and south sides are stalls for the clergy. The pulpit is placed so as to form the termination of the low screen wall, by which the chancel has been extended into the nave somewhat beyond the line of the chancel arch above. The base is of Croxdon Abbey and Hazelstine red stone, similar to that used for all the other internal masonry; above this base the pulpit is of the finest Painswick stone and veined alabaster. In plan it is a semi-octagon of unequal sides, and it is panelled and richly traceried on four sides, and has a larger and smaller cornice above and below carved with foliage. All the external masonry is of Hollington stone. The heating apparatus has been entirely remodelled and improved, and has been extended to the chancel and vestry. The general works have been executed by Messrs. Lowe & Sons, of Burton-on-Trent, who also have supplied the pulpit and all the joinery, including the chancel-seats and prayer-desk. The gas-fittings have been manufactured by Messrs. Brawn & Co.; the brass chancel-rails, a new alms-dish, the frontal and cover of the communion-table, and other furniture are supplied by Messrs. Jones & Willis; and the heating apparatus has been remodelled and extended by Mr. Parkes, all of Birmingham. The chancel has been laid with encaustic tiles by Messrs. Minton, Hollins & Co., of Stoke-on-Trent. The whole has been carried out under the direction and from the designs of Mr. W. Hawley Lloyd, architect, of 79 Colmore Row, Birmingham.

**Harrington.**—The parish church has been reopened after restoration. Mr. W. Deighton, of Workington, was the architect. The contractors were Mr. G. P. Cook, masons' work; Messrs. Porter & Pearson, joiners' work; Mr. J. Lawson, plasterers' work; Mr. D. M. Walker, plumbing and gasfitting; Mr. J. Whitfield, slating; and Messrs. Sherwood & Armstrong, painting and glazing, &c., all of Workington. The building will now seat 656 persons, and the cost of the work, including furnishing, has been 1,700*l*.

**Holywell.**—The new church which has been erected at the Holywell Union has been opened. It is built in the Gothic style, from plans prepared by Messrs. Douglas & Fordham, architects, Chester, and will seat about 300 persons. The building is of local stone, with Runcorn dressings. Mr. T. W. Sibeon, Holywell, was the contractor.

**Smallthorne.**—A south aisle and other additions have been completed at Smallthorne church. There is additional room provided for 120 worshippers. The improvements have been carried out by Mr. N. Bennett, builder, the architect being Mr. G. B. Ford, of Burslem. The cost, about 1,000*l*., has been borne by Mr. R. Heath, of Biddulph Grange.

## NEW BUILDINGS.

**Blackburn Infirmary.**—The annual meeting of the Governors was held on the 12th inst. The report stated that the new wing is in thorough working order, the wards being bright and cheerful. The cost was 4,897*l*. 15*s*. 9*d*. The wing and lodges were erected by Messrs. Thomas Higson & Sons, from the plans and under the superintendence of Mr. A. W. R. Simpson, the architect to the Board. During the year, heavy extra expenditure has been incurred in a new steam boiler, hot-water apparatus, rearrangement of boiler-house, steam cavity cooking range, &c., mainly rendered necessary by the extension. It was stated that about three months ago the infirmary was examined by a deputation of eminent French physicians, who were commissioned by the French Government to inspect and report upon four hospitals in Great Britain. They visited one in London (St. Thomas's), another in Edinburgh, a third in Wales, and the fourth was the Blackburn and East Lancashire Infirmary. This showed that the reputation of the institution had travelled even to France. After a very careful survey, the French physicians were delighted with the infirmary. They expressed themselves in the highest terms of the building, and more particularly of its sanitary arrangements, which have been carried out during the past eleven years under Mr. Simpson's directions.

**Messrs. Archibald Smith & Stevens**, hydraulic engineers, of Queen's Road, Battersea, have been instructed to erect one of Stevens & Major's patent hydraulic suspended passenger lifts at Craven House, Northumberland Avenue. This will be worked by water supplied through the mains of the London Hydraulic Power Company.

## SCHOOL BUILDINGS.

**York.**—New Roman Catholic day schools, in connection with the mission of the English Martyrs at York, have been opened. The premises are situate in Blossom Street, and have cost 2,000*l*. They will accommodate 500 children. It is intended to erect a church in front of the school as soon as funds will permit. Messrs. Goldie, Child & Goldie, of London, have been the architects, and the contract has been carried out by Messrs. Biscoomb & Sons, York.

**Newton Heath.**—The foundation stones of a new Wesleyan chapel and Sunday school at Monsall, Newton Heath, have been laid. The school will seat 300 persons, and the chapel (which will be over the school) is designed to accommodate 450 persons. The building is to be of grey bricks with Ruabon terra-cotta dressings, and will be roofed with Velinelli slates. Mr. A. W. Smith, of Manchester, is the architect, and Mr. Owen Williams, of Moss-side, the contractor. The estimated cost of the building is 2,000*l*.

**West Kirby.**—The elementary schools which have been built at West Kirby, on a site near the old parish church, have been formally opened. Mr. Thomas Browne, of Tower Wharf, Chester, was the contractor, and the architect was the late Mr. William Kelly, also of Chester, who died but a short time before the contract was completed. The buildings are estimated to cost 3,118*l*., and are beautifully situated, commanding an excellent view of the Dee and the Welsh hills. The schools, which are after the old Cheshire style, built with half-timber gables and with tracery beams, are of Ruabon pressed brick, from the works of Mr. J. C. Edwards, and local red stone dressings. The roof is covered with Ruabon brindled tiles, and is surmounted by two turrets.

## GENERAL.

**Mr. Robert Thorburn, A.R.A.**, has retired on the honorary list of the Royal Academy.

**The Spring Exhibition** of the Derby Corporation Art Gallery opened on Saturday.

**The East Window** of Ewerby parish church has been filled with stained glass, as a memorial of the late Earl of Winchelsea and Nottingham. The work has been done by Mr. W. F. Dixon, of University Street, London.

**A Second Stained-Glass Memorial Window**, to be placed on the north side of the outer aisle of the nave of the Manchester Cathedral, has been promised to the Restoration Committee.

**Mr. Vicat Cole, R.A.**, has been elected a member of the Athenæum Club under the special rule.

**Mr. Charles Bell, F.R.I.B.A.**, has been appointed architect for the Abingdon Cottage Hospital and the Endowed School at Longton.

**A Red Sandstone Wall**, believed to be a portion of the old Priory Chapel wall, has been discovered in Corporation Street, Birmingham.

**Mr. W. J. Wood**, architect, of Finsbury Pavement, is preparing plans and estimates for the restoration of the south aisle of Great Burstead church, including the old west window, which was destroyed.

**The University of Oxford** has granted 1,050*l*. for improvements on the Ashmolean Museum, but it is probable that the money will be expended without the superintendence of an architect.

**The Members** of the Edinburgh Architectural Association on Saturday visited the new prison buildings of Calton Gaol, Edinburgh. Permission for the visit was granted by the Home Secretary, on condition that no notice of the visit should appear in the public journals.

**The Aberdeen Corporation** proposes an extension of the water supply by the construction of two new reservoirs, which, with the necessary new buildings and machinery, is estimated to cost 35,000*l*.

**Messrs. Clark, Bunnett & Co., Limited**, engineers, of Rathbone Place, W., have received instructions from the War Office to erect and ship in fourteen days, thirteen corrugated iron buildings for stores, for service in the Soudan, covering an area of about 25,000 super feet.

**The American Elevator Company**, of Old Jewry, E.C., have been instructed to furnish one of their standard hydraulic elevators in the Alexandra Home, which is being erected in connection with the Royal College of Music, as a residence for those of the lady students of the college whose homes are out of London. This home is being erected under the patronage of H.R.H. the Princess of Wales, and the work is being carried on under the supervision of Sir Philip Cunliffe Owen.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, FEBRUARY 28, 1885.

## CONTRACT PLANS.

AN action was brought at the Liverpool Assizes last week by Mr. William Christian, a builder and contractor, against Samuel C. Ridley, the owner of some property situated near Bidston Road, Birkenhead, to recover the price of work done in making a road and laying down a sewer. The defendant pleaded that the work was done under a contract by which the money was not to be paid until the contract was completed; that the contract had not been completed; that the work had not been done to his satisfaction; and that he had in fact paid plaintiff more than the contract price. After the contract for the work had been signed it was found that the Birkenhead Corporation would not approve of the plan of the sewer as it had been originally prepared. This necessitated a delay, and a new plan had to be drawn up, according to which the sewer had to be made considerably deeper than specified in the contract, which involved extra work. For the defence it was contended that there was no material difference between the two plans, and that the work had not been done to the satisfaction of the defendant. Mr. Justice Day submitted several questions to the jury, which were answered as follows:—Was the contract of December 18, 1883, based on the new or on the old plan? The jury: On the old plan. Did the defendant represent to the plaintiff, pending the negotiations, that the old plan had been submitted to and approved by the Corporation? Yes. Did the defendant know that to be untrue? Yes. Did he make the representation for the purpose of inducing the plaintiff to enter into the contract? Yes. Did the defendant in January agree to pay for the extra work rendered necessary by the adoption of the new plan? He did. Judgment was accordingly entered for the plaintiff on all the points in dispute.

## THE NEWBURY JOINERY AND MOULDING MILLS.

EARLY on last Saturday morning the whole of the Albert Steam Joinery Works and Moulding Mills at Newbury, the property of Mr. Samuel Elliott, were completely destroyed by fire. The works were situated at the north of the town, and occupied several acres. The true origin of the fire is unknown, but it is supposed the bearings got heated, and the conflagration was terrible. The destruction to the machinery alone is estimated at 8,000*l*. The immense piles of burning timber made the scene to the west a grand but awful sight, the flames reaching 250 feet in height. The masses of burning stack sheds covering acres was a terrible sight. The engines happily did not explode, the safety-valves being open. The loss is estimated at between 25,000*l*. to 30,000*l*., and included a vast stock of mouldings and joinery which were ready to be despatched to different parts on the same morning. The glare was seen at Wootton Bassett, six miles west of Swindon, being a distance of nearly forty miles. Policies were effected with the Lancashire and Liverpool,

London, and Globe Insurance Companies. Mr. Elliott is also a large building contractor, having lately commenced several contracts, and employing many hundreds of men. In this branch the losses included a large quantity of valuable plant and a traction engine and seven trucks, valued at 1,500*l*.

## BUILDING LAND AT LEWISHAM.

THE result of a sale which was held at the Plough Inn, Lewisham, on Monday evening last, by Mr. Richard J. Collier, showed that building land in that locality is at present increasing in value. The property submitted comprised the second portion of the Priory estate, at Lewisham, which was offered in sixty-nine lots. Before the commencement of the sale Mr. Collier made an interesting statement to the effect that the Priory mansion had been subdivided into two houses, and that in consequence the historical old structure would be preserved in laying out the estate for building purposes. One-half of the mansion had been sold previous to the present sale. The sale commenced on Monday with active bidding, and there was a spirited competition for the whole of the lots, all of which, with the exception of eight, were sold at prices much better than those obtained at the previous sale; the front lots, containing 18 feet frontage with a depth of 100 feet, selling for 150*l*. each, whilst the majority of the back lots realised about 4*l*. per foot frontage. The kitchen garden, and the remaining portion of the mansion, were bought in. The total proceeds of the sale amounted to 5,000*l*.

## AUCTION SUMMARY.

For the Week ending March 7.

(See Advertisements.)

TUESDAY, 3rd:—

Messrs. Horne, Eversfield & Co.—Corrugated Iron Buildings. New Cross.

WEDNESDAY, 4th:—

Messrs. Foy, Morgan & Co.—Timber. Baltic Sale-room.

THURSDAY, 5th:—

Messrs. Farebrother, Ellis, Clark & Co.—Freehold Building Site, Vine Street, Clerkenwell.

FRIDAY, 6th:—

Messrs. Frank Lewis & Co.—Freehold Land, with Brick Earth. The Mart, Tokenhouse Yard.

## APPOINTMENTS VACANT.

NORWICH.—The County Magistrates will meet at noon on Saturday, March 7, to elect a Surveyor, to combine the offices of County Surveyor and County Road Surveyor, held respectively by the late Mr. R. M. Phipson and Mr. R. M. Brereton, resigned. Mr. Charles Foster, Clerk of the Peace, Shirehouse, Norwich.

## COMPETITIONS OPEN.

COLCHESTER.—March 25.—Designs are required for Remodelling and part Rebuilding the Cups Hotel. Mr. H. H. Elwes, Secretary, Exchange and Cups Hotel Company, Colchester.

CROYDON.—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100*l*., 30*l*., and 25*l*. for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

WINDSOR.—Feb. 28.—The Town Council of New Windsor invite designs for a panel of tapestry to be fixed in the Guildhall. Three prize-winners will be invited to compete for the cartoon from which the panel of tapestry will be woven. The Town Clerk, 4 Park Street, Windsor. Competitors must be resident within five miles of the Guildhall, Windsor.

WOLSTANTON.—March 2.—Plans are required for School and Caretaker's House. Mr. Henry Farmer, School Board Offices, Tunstall.

## CONTRACTS OPEN.

ABERDARE.—March 9.—For Building 100 Cottages. The Powell-Duffryn Steam Coal Company, Aberaman Offices, Aberdare.

ABERDEEN.—March 7.—For Building Dwelling-houses at Auchentumb, Stricken, and other Places; also Offices, &c. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

BANFF.—March 11.—For Building Dwelling-house for Mr. A. Watt, Solicitor. Messrs. Matthews & Mackenzie, Architects, 225 Union Street, Aberdeen.

BARTON-UNDER-NEEDWOOD.—March 9.—For Building Board Schools. Messrs. Giles & Brookhouse, Architects, Derby.

BATTERSEA.—March 5.—For Construction of Temporary Timber Foot Bridge over the Thames, and Removal of Old Bridge. The Engineer, Metropolitan Board of Works, Spring Gardens, S.W.

BELFAST.—March 12.—For Building Sheds and Structures for Agricultural Show. Mr. W. Hastings, C.E., Victoria Hall, Belfast.

BIRKENHEAD.—March 2.—For Building Insane Wards at the Workhouse. Messrs. Holt & Wise, Architects, 4 Water Street, Liverpool.

BRAEMAR.—March 3.—For Building Public Hall. Messrs. Pirie & Clyne, Architects, 123½ Union Street, Aberdeen.

BRAY.—March 1.—For Extension of Concrete Sea Wall and Promenade (602 yards). Mr. P. F. Comer, C.E., 37 College Green, Dublin.

BUCKIE.—March 7.—For Building Shop and Residence. Messrs. Bruce & Sutherland, Architects, Banff and Buckie.

CONNAN'S QUAY.—For Erecting Building at Cemetery for storing Hearse, Tools, &c. Mr. Clement W. Tibbits, Clerk to the Burial Board, Connaught Quay.

COXLIDGE, NEAR NEWCASTLE-ON-TYNE.—March 3.—For the Erection of Two Additional Wings, each for about 75 patients, together

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHERS

FOR

## INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

**MR. RICHARD J. COLLIER** will SELL by AUCTION, at the Auction Mart, on Friday, March 13, at One for Two o'clock, in Lots, absolutely without reserve, 23 carcases, situate in Stanley and Tiltotson Roads; also, at nominal reserves only, 10 long Leasehold Residences, Nos. 1 to 19 (odd numbers) Tiltotson Road, and three pairs of semi-detached Villa Residences, Nos. 21 to 23 Queen Anne's Villas, Hyde-side Road, Edmonton, a pleasant and healthy position overlooking the grounds of the Edmonton Cricket Club.

May be viewed, and particulars, with conditions of sale, had at the Mart; of Messrs. Sankeys, Flint & Sankey, Solicitors, Cecil Square, Margate; and of the Auctioneer, 25 Finsbury Pavement, E.C.

### WOOD GREEN.

Chitt's Hill Park Estate, commandingly situate near several railway stations. Payments extending over nine years. Free conveyances.

**MR. RICHARD J. COLLIER** will SELL by AUCTION, at the Nightingale Hotel, Wood Green, on Wednesday, March 11, at Six for Seven o'clock in the evening, 36 lots of valuable FREEHOLD BUILDING LAND, with frontages to Maryland Road, leading out of the main Southgate Road, offering capital sites for the erection of villa residences, which are in demand.

Plans and particulars may be obtained at the place of sale; of Messrs. Best, Webb & Templeton, Solicitors, 6 Essex Street, Strand; of A. T. Hawkins, Esq., 22 Budge Row, E.C.; and of the Auctioneer, 25 Finsbury Pavement, E.C.

### RESULT OF SALE AT LEWISHAM.

**MR. RICHARD J. COLLIER** begs to announce that of the Sixty-seven Plots of FREEHOLD BUILDING LAND offered by Auction on Monday Evening, Sixty Plots were Sold. The kitchen garden and portion of mansion were bought in, and may now be treated for on easy terms. Offices—25 Finsbury Pavement, E.C.

### Periodical Sale of Marble Chimney-pieces and Fenders.

**MR. JAMES POUSTY** will SELL by AUCTION, at the Marble Stores, 9 Castle Street, Holborn, on Tuesday, March 3, at One, an extensive Stock of MARBLE CHIMNEYPIECES, also a quantity of Marble Fenders, Tile Hearths, Stoves, &c. On view. Catalogues of the Auctioneer, 9 Castle Street, Holborn.

### CITY OF LONDON.

St. Paul's School, and 35 St. Paul's Churchyard.

**MESSRS. DANIEL SMITH, SON & OAKLEY** have received instructions from the Worshipful Company of Mercers to LET by AUCTION, at the Auction Mart, Tokenhouse Yard, Lothbury, E.C., on Tuesday, March 21, 1885, in one Lot, on lease for a term of 42 years, the very important, substantial, and extensive premises at the east end of St. Paul's Churchyard, which have been for so many years occupied by St. Paul's School, together with the adjoining corner house, No. 35 St. Paul's Churchyard. These premises occupy a position which is almost unrivalled in the City of London, having extensive frontages to St. Paul's Churchyard and Old Change, and also a frontage to Watling Street, and having the great advantage of first-rate light, especially on the Churchyard side.

The premises occupied by the School and the Masters' houses are extremely strongly and well built, with a fine Classic façade in stone.

The premises are well adapted for any Public Institution requiring a prominent situation and a large building. They are capable of conversion and alteration for commercial purposes, and with the addition of the corner House, No. 35, form such a block of premises as is seldom to be met with in the heart of the City.

The total area is about 10,000 square feet.

Full particulars, with plans of the premises, may be obtained on application to John Wanney, Esq., at the Clerk's Office, Mercers' Hall, Ironmonger Lane, E.C.; of George Barrow Williams, Surveyor to the Company, Mercers' Hall; at the Auction Mart; and of the Auctioneers, 10 Waterloo Place, Pall Mall, S.W.

Very valuable piece of Freehold Land, containing first-class brick earth of very considerable depth.

**MESSRS. FRANK LEWIS & CO.** will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Friday, March 6, at Two o'clock precisely, a very valuable piece of FREEHOLD LAND, comprising 3½ acres. It adjoins the Chequers Inn, Woodburn Common, Bucks, and the well-known brickfield, carried on for many years by Mr. Billinghurst, and contains brick earth of high quality, believed to be about 40 feet in depth, thus affording supply for very many years to come for a new brickfield. The property is within one mile of the Woodburn Green and Bourne End Stations on the Maidenhead and Oxford branch of the Great Western Railway, and about thirty miles from London.

Particulars may shortly be had of Messrs. Darvill, Darvill & Last, Solicitors, Windsor; and of Messrs. Frank Lewis & Co., Land and Estate Agents, 95 Gresham Street, London, E.C.

[For remainder of Auctions, see page xl.]

**BATLEY.**

For Building Five Terrace Houses, Bath Street, Batley, for Mr. J. W. Blackburn. Mr. WALTER HANSTOCK, A.R.I.B.A., Architect, Batley. Quantities by the Architect.

**MEDALS AND PRIZES.—A Special General**

Meeting of the Royal Institute of British Architects will be held on Monday, the 2nd March, at Eight P.M., to elect a ROYAL GOLD MEDALIST and award the current year's medals and other prizes, for particulars of which, and of other business to be transacted, see the "Journal of Proceedings," issued on the 19th February to Members and Correspondents. The drawings submitted are on view at the Institute from Friday Evening, the 27th February, until Thursday, the 5th of March, both days inclusive.

**EXAMINATION IN ARCHITECTURE.**—The Board of Examiners will meet on Monday, the 9th March, to receive the applications and examine the probationary work of candidates desirous of qualifying themselves for nomination as Associates of the Royal Institute of British Architects. The last day for receiving applications, &c., to be made in accordance with rules which may be obtained of the undersigned, is Saturday, the 7th March.

J. MACVICAR ANDERSON, Hon. Secretary.  
WILLIAM H. WHITE, Secretary.  
Royal Institute of British Architects, 9 Conduit Street, Hanover Square, London, W.

**ARCHITECTURAL ASSOCIATION, 9 CONDUIT STREET, W.**

The Eleventh Ordinary Meeting will be held on Friday Evening next (March 6), commencing at 7.30, when a Paper will be read by JOHN SLATER, Esq., on "Building Stones."

W. H. ATKIN BERRY, HERBERT D. APPLETON, } Hon. Secs.

TO

ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.

Ask your Factor or Ironmonger for  
"MITRE NAILS."

WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**GRUNDY'S PATENT  
WARM-AIR****VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W."

"June 10, 1884."

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it."

Yours, &c.

JAMES WEIR, F.R.I.B.A."

"To Mr. Grundy.  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square."

"February 15, 1884."

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public."

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen."

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.  
Works—TYLDESLEY, near MANCHESTER.

## THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

## CHURCH WALL VENTILATOR.—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

OUR PATENT EXTRACTOR is the best in the Market, and is supplied at a very much lower price than any other.

CHURCH WINDOW VENTILATOR.—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

Diffuser with Filter.

Air Extractor.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp, dirt, and disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper trap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and, successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{2}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in hospitals, banks, hotels, many offices, private residences, &c., with most satisfactory results. Set on a tiled or mosaic floor within walls or a dado of glazed tiles, in appearance and action they leave nothing to be desired. The usual wood framing, forming a storehouse for the retention and accumulation of damp, dirt, and disease germs, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a slop sink or urinal, and with the absence of framing the body assumes a more natural position, which is found greatly conducive to convenience and comfort in use.

**GEORGE JENNINGS,**  
SANITARY ENGINEER, STANGATE, LONDON, S.E.  
A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED.

## BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

- Receives and disconnects one Rain-water Pipe and Three Waste Pipes.
- Avoids all Splashing.
- Ventilates the Pipes and Trap.
- Forms Drain for Area or Surface.
- Is easy of Access for Clearance.

The ordinary P or S trap to be used in connection with Gully, being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT WORKS, 8/6 EACH.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

**CASES FOR BINDING THE ARCHITECT,**  
Price Two Shillings.—Office: 175 Strand London, W.C.

# The Architect.

## THE WEEK.

THE disesteem in which architects are held in England, through no fault of their own, appears to have extended to France. It is no longer uncommon to read of attempts to dispense with an architect's services. This week a remarkable slight has been cast upon the profession. Two streets in Paris which have been called after architects now bear new names. The Rue Lefuel has become the Rue de Sontay, and the Rue Vaudoyer is the Rue de Sfax. If architects had been opposed to the wars in Africa and Asia, the change might be supposed to be an act of retribution, but it can only be interpreted as a consequence of some want of pliability on the part of one of the architects of the Municipal Council.

MR. E. R. ROBSON was on Saturday last presented with a testimonial and address by the assistants who formed his staff while he held the office of Surveyor and Architect to the School Board of London. The testimonial is a silver casket, weighing eighty-five ounces, which was manufactured by Messrs. MEYER, in the form of a Greek temple supported by twelve columns, and the address, which is in book form, is enclosed within it. The presentation was made at the offices of the Board, and at the ceremony Mr. LEWIS WALL acted as chairman, with the support of Mr. T. J. BAILEY, the architect, Mr. ANDREW YOUNG, the surveyor, and other heads of the department.

ENGLISH painters are more fortunate than those of France, as they have a longer time to prepare for the annual exhibition. Works of painting (with those of architecture and engraving) are received at the Royal Academy on the 27th, 28th, and 30th of this month, and sculpture on March 31. But paintings and drawings for the Salon must be left at the Palais in the Champs Elysées not later than the 14th inst.; sculpture has from March 21 to April 2, while architecture, engraving, and lithography may be delivered between the 2nd and the 5th of April. The French arrangement is preferable to the English, for there is no advantage in crowding etchings, water-colours, enamels, engravings, and architectural designs along with paintings. At the Salon there is a time as well as a place for everything.

PROFESSOR GEIKIE, the Director of the Geological Survey of Great Britain, when speaking in Edinburgh on Monday, described the work which has yet to be done by the surveyors. The first in importance is the completion of the drift survey, particularly to trace out as accurately as possible the southern limit reached by the glaciers, as shown by the boulder clay. It is next proposed to complete the detailed surveys of the coalfields on the scale of six inches to the mile. Professor GEIKIE would then complete the series of sheet memoirs, which would supply details which could not be presented on the maps. The memoirs would pave the way for the crowning work of the survey, namely the stratigraphical monographs, or detailed descriptions of each of the geological formations of the country. But even then the work could not be considered complete; for the Director considers that a geological survey ought to resemble an astronomical observatory, and allow of perpetual observations.

THE honorary retired list of the Royal Academy has been increased this week by the addition of the name of Mr. ERSKINE NICOL, who has been an associate since 1866. Mr. NICOL is a Scotsman, but his reputation was made by his figures of Irish peasants. The first of them was the "Onconvenience of Single Life," which was made popular by means of highly coloured lithographs. The artist took up his quarters near Multifarnham, in Westmeath, a district which, although one of the least picturesque, contained good materials for *genre* pictures.

Mr. NICOL was most successful when representing Irishmen of the stage type, and he failed when he attempted to depict the darker side of life on the island. This arose partly from a deficiency of tragic power, but mainly from the artist being a painter of costume rather than character. Mr. NICOL in his first picture discovered that the world could admire shreds and patches and frowsy garments, and he was wise to follow the public taste. But there is a marvellous difference between his peasants and those which the present Director of the National Gallery used to draw, or those of the late Mr. TOPHAM.

THE Parliamentary return showing the sums expended on pictures by the trustees of the National Gallery between 1860 and 1884 out of money provided by Parliament suggests the economy of the State and the difficulty of obtaining first-class works. In the quarter of a century the outlay has been 250,091*l.*, or 10,000*l.* a year on an average. But in two of the years, 1871-72 and 1872-73, there was no expenditure, and in 1877-78 the amount was only 350*l.* The largest sum expended in one year was in 1870-71, when 76,500*l.* was laid out. Of that sum the Peel collection, consisting of seventy-seven pictures and eighteen drawings, absorbed 75,000*l.* In 1874-75 the Barker collection of thirteen pictures cost 10,395*l.*, and in 1882-83, for the Hamilton collection of ten pictures, a sum of 21,042*l.* was paid. It is remarkable that during the whole period there was not one instance when as much as 10,000*l.* was paid for a single picture. The *Ansidei Raphael* is therefore the first expensive picture which has been bought.

THE quantity of arsenic which was at one time employed in the manufacture of paperhangings may be inferred from what was said by Mr. AUMORIER in the paper read by him at the Building Exhibition on Monday. One firm in the trade stated that they formerly used on an average one ton of emerald green per week all the year round. The colour is the most arsenical in general use, and, in round numbers, half of its weight may be considered arsenical. This would give a consumption in one factory of about twenty-five tons of arsenic per annum, and as there were several other makers in an equally large way of business, and a number of smaller factories, it would be safe to assume that this firm did not use one quarter of the whole quantity used in the trade of England alone. It is, therefore, certain that at least 100 tons of arsenic were annually used for paper staining until its employment was voluntarily abandoned by manufacturers under the pressure of public opinion.

THE decisions which were given by Lord COLERIDGE and Mr. Justice SMITH on Wednesday are likely to make local authorities become more expeditious in raising objections against buildings which are supposed to show a departure from bye-laws. A new building was erected in Hove without the approval of the Commissioners of the district. According to the bye-law, no time is named for serving notice, but the Public Health Act states one month. As the notice was not given in that time, the magistrates dismissed the summons. The Commissioners appealed on the ground that the section as to the month only applied where it was proposed to pull down a building. Lord COLERIDGE, however, held that the surveyor of the Commissioners was bound under the Act or the bye-laws to give notice to the builder within a month that the Commissioners disapproved. The Act said that the local authority "shall" signify their disapproval within the month, and they could not make any bye-law at variance with this or going beyond it, and therefore they were precluded from recovering the penalty. Mr. Justice A. L. SMITH concurred, and said that according to the Act the local authority "shall" within a month signify their approval or disapproval, and the enactment had imposed a statutable limit on the exercise of their powers—a most salutary limitation, for a man was not to be precluded for ever from building on his own land. The defendant had waited the month before he went on with the building, but the Commissioners had not within that period signified their approval or disapproval. The decision of the magistrates on dismissing the case was therefore supported.

## THE COUNTRY MEMBERS OF THE INSTITUTE.

IN the contemplated reforms at the Institute how are the country members to be benefited? Under the present charter they are entitled to all the privileges enjoyed by the London members, and are precisely on the same footing as regards the payment of subscriptions. On the Council they are represented by five members, being one-third of the whole number. The charter, however, limits the power of voting to Fellows who are present at the meetings, and all Associates are debarred from voting or otherwise interfering in the regulation of the affairs of the Institute—the office of auditor being the only one excepted. Country members complain, and, as we have often said when treating on this subject, justly complain, that the restrictions in voting are vexatious to them, and should as far as possible be removed. We can see no valid reasons against taking powers, under a new or supplemental charter, to extend the power of voting to every architect who supports the Institute by his subscription. The difficulty is, how far can this be done? If a clause were inserted in the new deed, of the kind we have heretofore proposed, authorising voting by proxy or by voting papers, elasticity would be gained, and ways and means found for meeting present difficulties. Both in the class of Associates and in the large number of country members, a state of things has arisen which we may safely say was never contemplated when the charter of WILLIAM IV. was granted. At that time the majority of architects of any eminence in the profession were resident in the metropolis, so that this limitation as to voting was natural. Now all over the United Kingdom there are many architects of great ability. London no longer dominates the country. Every big city becomes a centre, and opinions can be so easily exchanged that country architects are put almost upon an equality of advantages with their London brethren. The particular educational advantages which London possesses are generally made use of by men some time or other before they settle down to practice; and though in the country they miss those opportunities for meeting and discussing matters of interest which are available in town, these drawbacks are, after all, not very serious. The records of successful competitors in competitions show how many are taken by provincial architects, and the great one of this decade has been carried off by Halifax. One of the tendencies of modern civilisation is, apparently, decentralisation; and, though London must always possess great advantages, it will no longer enjoy that entire exclusiveness in matters of art and literature which it has formerly held. Day by day barriers are broken down which formerly hedged-in the profession, and the country offers baits sufficiently tempting to secure able men to settle and practise there. Country practitioners in architecture now frequently turn the scales, and carry out works in London and its neighbourhood.

The Institute ought, if it is to be representative, to include every man of note in the profession, but to do this it must give some *quid pro quo*. We have often heard the expression from country architects, "What is the good of joining the Institute? We can seldom attend the meetings, and unless we are present at them we cannot exercise our vote." There *is* some good in joining the Institute, if it were only for the sake of attempting the cultivation of *esprit de corps*, strengthening the hands of the profession generally, and forming some barrier against the admission into their ranks of men in no way qualified to be architects. A society which included all the best men of the profession would possess a power for extending their privileges and gaining a recognised position, which would be of inestimable advantage if wisely and energetically utilised. Now that admission as an Associate of the Institute is by examination, some guarantee is afforded of competency. Probably, examination for the grade of Fellow, to any one who shall seek that honour, will be logically required as time goes on.

It is in the election to the Council where the country members may fairly demand to have a voice, which, unless present, they cannot at present use. We can see no reason why all elections to the various offices now in the hands of Fellows, and elections on to the Council, should not be conducted by voting or balloting papers. To accomplish

this would be a wise reform, and would doubtless bring, in time, more provincial architects into the Institute. In other societies this plan of voting by papers or by proxy answers well, and would we fancy be appreciated at the Institute. The Council elected by the whole body of Fellows and by the Associates (should the vote be extended to the latter), would be far more representative and powerful. Perhaps, at first, the eagerness to make use of the suffrage would show a greater departure in the composition of the Council than has been apparent of late years. Something there is, wanting now at the Council-board, which an extension of the voting-power may, and we hope will, supply. Some think that the system of voting by papers, or by proxy, should be extended beyond the province of elections to offices and for members of Council. We are decidedly of opinion that it would not be practicable to make such an extension. In an election there is a certain definite issue. The whole matter is before the voter; no arguments will be offered to him for his consideration; he has but to say his yea or nay to the names on the list in his hands. But in all matters where argument enters in—and men must have their say with *pro and con*—the case is different. A man may enter a room prepared to vote upon a certain question in a certain way. While listening to the debate, another character is put upon the matter in discussion, which so alters the complexion of it that he votes contrary to his first intention. Again, were this voting extended indiscriminately, country members would be constantly asked to give their votes on questions as they arise, the value of which votes, and their bearing on the Institute, they could have no possible means of weighing. Thus a state of things would come which would end in abuse of the privilege, and simply go to encourage sedition and unrest, be most unwise and injudicious, and soon bring about the downfall of the Institute.

Another method of securing greater cordiality between architects would be the holding of conferences in the various great centres. The provincial architects in some of our extensive manufacturing districts have so much to show their London friends that very pleasant meetings might be arranged, which would do much to make the profession better known to the public, and architects to each other. The plan has often been proposed; let it be carried out, and not end, like so much else, simply in talking about it.

Why among the papers read at Conduit Street are so few of them from country members? Men whose avocation is the using of the T-square are not, as a class, renowned for their gifts of composition and eloquence; but many, laying no claim to these talents, could impart most useful information; and were some pressure put upon the country members, it is probable they would be induced to contribute more often to the volumes of the "Transactions." Everything that will excite interest among all classes of the members, should in wisdom be assiduously cultivated by those whose responsibility it is.

The system of holding local examinations for admittance to the class of Associates is a wise one, and will doubtless be extended. No difficulties should be put in the way of men wishing to join the Institute. Another great want is a kind of club-room. Professor KERR gave expression to this not long ago, and we have often heard men express their surprise that the Institute has no place where architects can meet, and see a friend, client, or builder. Such a general meeting-room, provided with the papers, journals, means for writing, &c., would be a real boon. Country members would find the room exceedingly useful, and every effort should be made to supply it.

In such ways as we have touched upon, the advantages of membership of the Institute may be extended to country architects, and their support and sympathy secured.

---

**The Committee** of the City of Manchester Art Gallery have arranged for an exhibition of works of modern artists, to be opened on Friday, September 4 next. The exhibition will comprise paintings in oil and water-colour. In selecting and hanging the works sent for exhibition the committee will have the assistance of a member of the Royal Academy.

**Owens College, Manchester**, is one of the recipients of the publications of the Record Commission, which are now being distributed by the Treasury.

## MR. HOLMAN HUNT AND M. MUNKACSY.

IT is easy to see the operation of very different influences in the two pictures by Mr. HOLMAN HUNT and M. MICHAEL MUNKACSY, which were shown to the public on the same day, one in Bond Street, the other in Piccadilly. M. MUNKACSY could hardly escape from the supposition that a painting of a religious subject is intended to appeal to crowds of people in churches. Whatever might be the destiny of his work, early associations would compel him to treat it in a way which might be understood by the multitude. The body is therefore to him much more than the raiment, and such powers as he possesses are employed on expression rather than on details of costume. A painter like Mr. ALMA-TADEMA would be horrified at the garments which are thrown on the Romans and Jews, who are the actors in the scene represented in *Calvary*; but it must not be forgotten that many generations of men have been satisfied with seeing figures in religious pictures wearing robes of a form and colour that were never seen in the East or elsewhere. The worshippers in a church are not sticklers for accuracy in costume, and they cannot wait for a picture to slowly grow upon them by a development of its meaning. Everything must strike the mind at a glance or not at all. If we may be allowed to make the comparison, M. MUNKACSY is like an actor who has to think mainly of the gallery, and who is therefore obliged to exaggerate in order that effects may tell. When he paints villains (and there are a great many of them in *Calvary*) he seems as if he were endeavouring to excite the spectators to hiss and hoot. With painters of his class it is difficult to suppose that "one may smile and smile and be a villain;" the mind's construction is, according to them, always to be seen in the face. Mr. HOLMAN HUNT, on the other hand, knows nothing of the thoughts which are excited in peasants and humble folks by the sight of pictures in a church. His spectators, if few, are fit, and are supposed to have the time and qualifications which are necessary in order to comprehend all the ideas which he expresses on canvas. "Beautiful things are difficult to be understood," says the Greek proverb, and before the picture can be appreciated we must know the differences between the Western and Eastern churches in respect of certain traditions; we must realise that the landscape has the fidelity of a photograph, and maintain that existing forms are identical with those of the first century, we must accept Rabbinical stories, and, with the mystics, believe that we are environed with a spirit world, although without eyes to see it. Greek poets could suppose that rivers were endowed with life, and show favouritism by taking sides in the contests between Greeks and Trojans. In looking at Mr. HOLMAN HUNT's picture, we must likewise see nothing unreasonable in a stream becoming transfigured and assuming the form of iridescent spheres in which past events are mirrored. "To reason about faith," says SWEDENBORG, "is to doubt and deny," and to enjoy *The Triumph of the Innocents*, unhesitating acceptance of the author's belief is, we suppose, indispensable. Make it the subject of discussion, and we fear its success becomes doubtful.

*The Triumph of the Innocents* depicts that Flight into Egypt which has been so often and so variously treated by painters. It is not uncommon to find the Holy Family with an accompaniment of angels, but this is the first time in which their place is taken by the spirits of the slain Innocents. It is an effort of the imagination, which merits our recognition. The children form three groups. There is an advanced guard of three who are types of different races. One wears the robes of a priest and of the colour which befits martyrs: he looks upwards, as if he were possessed of the "vision and the faculty divine;" a second, who has the bearing of an English boy, bends his palm branch with a smile that is suggestive of a joy in suffering; while the third, of darker hue, has the stolid gravity which is often seen among African ecclesiastics. Then there is the largest group, consisting of several children, who nearly surround the Holy Family. They are not supposed to have attained the insight of the foremost children, and their office seems to them a sort of game. One child, with naïve wonder, looks through the cut which has been made in his shirt by the sword for the wound which pierced his breast—it may have been an hour earlier. The children are garlanded, and

there is much variety of colour and costume among them. The third group is floating in the air—indeed the infants are so young they could hardly be expected to walk; they must acquire new powers if they are to follow the others. They seem to be in a troubled sleep, and are, we suppose, to be taken as the very latest victims of HEROD.

The groups of children are unlike any which are known in art. We have published groups by LUCA DELLA ROBBIA, ALBANO, and others, which should exemplify what has been done in representing child-life; but Mr. HUNT's figures have little resemblance to them, or to those which have been given by REYNOLDS and STOTHARD. They are not the children which are to be seen every day, for they have undergone a process of sublimation which has taken the earthly character out of them. It seems to us they are too mature in body and expression. It may have been the painter's intention to suggest that for them there was no more growth, and somehow their joy is mixed with sadness. The infants who float in the rear of the procession are nude, and they show a muscular development that is not to be seen in nurseries. That softness of flesh and delicacy of contour which belongs to early childhood are absent throughout. There is another peculiarity. The children have all the nimbus (which is seen descending on the latest of the slain), but it is of a form that, so far as we know, is without precedent. The nimbus has been made square, circular, cruciform, triangular, elliptical, flame-shaped—or, in other words, of a form that is geometrical—but Mr. HUNT shows it as a sort of crown of scintillating light that corresponds with the shape of the head. The innovation is reasonable, but it adds so much to the painter's difficulty that it is never likely to supersede the old conventional arrangement. The original meaning of the word refers to something cloudlike or radiant, and therefore Mr. HUNT's treatment of the form is the more consistent, as it suggests an emanation of glory.

The central group is composed of the Holy Family. The Virgin, who carries the Infant SAVIOUR in her arms, is seated on a smooth-skinned donkey of the Mecca breed, which is led by St. JOSEPH. But as he turns towards Bethlehem, in the fear of pursuit by the soldiers, we only see his back, and attention is concentrated on the two principal figures. The face of the Virgin is more English than Eastern in type, and it has many of the characteristics of a portrait. The Virgin is engaged in dressing the Holy Child, and appears to be unconscious of the troop of attendants which are around, while the SAVIOUR turns to them with joy. The painter's own description of his work tells us that MARY is thinking of "the woes of the children torn from their mothers' breasts for ever, and of the bereaved childless women mourning their dearest ones; she searches her much-harassed mind to find consolation for the weeping neighbours of her home." Emotions like those are difficult to represent, and unless imagination helps us we cannot say they are visible on the canvas. Mr. HOLMAN HUNT says that to him "it seems that among the saints in the group which fostered the Christian Church during its first perils, none was greater than JOSEPH." But, as we have said already, we do not see the face of the saint, and the figure suggests a more vigorous man than is usually found in paintings of the Flight.

The time selected by the painter is night. We see the deep blue eastern sky studded with solemn stars, and the quiet country that seems almost of the same colour, with the lights in the distance, which are suggestive of commotion, and of a village where there was lamentation and RACHEL weeping for her children. But while the landscape is so dark the whole of the figures are in the strongest light, and the colouring has a vividness that is suggestive of something more powerful than the sun's rays. In pictures by CORREGGIO and REMBRANDT, where there are powerful effects of this kind, the source of illumination is supposed to be the SAVIOUR, but in this case the cause is not suggested. The wild dogs are scared by the light, but there is nothing to show that MARY and JOSEPH are conscious of it.

The light has an important office to sustain. Mr. HUNT is a realist and yet a mystic. We might go so far as to assert that his realism is an effect of his mysticism, for it is the very intensity of his vision which makes his work differ from other men's. But if, as has been done before, the Flight

into Egypt were made a night scene in which the wayfarers were dimly visible, what would become of his power over detail? One thing or the other must have been sacrificed if it had not been for the inspiration to introduce a light which should surround the figures like a divine atmosphere. Mr. HUNT thus secured an opportunity to be as realistic as he chose, for it may be supposed that we see everything with the aid of an exceptional illumination. The detail in the work is marvellous, and everything is put before us with the most conscientious exactitude. It is only by taking inch after inch of the figures that the fulness of the work can be understood. We are not, perhaps, exaggerating when we say that many a picture is to be seen in Bond Street which must have taken less time than was expended in painting the carpenter's tools and basket which St. JOSEPH carries on his back.

The detail does not lead to spottiness or littleness of colour. In none of Mr. HUNT's former works have we seen greater richness. The whole blends admirably, with a single exception, and that is a cap on one of the children, which is of so hard a blue that it must have been a product of one of the colours invented by modern scientists. The picture is a great work, and it has been accomplished under difficulties which were enough to have made the bravest cast the canvas aside.

M. MUNKACSY, like Mr. HUNT, has departed from stereotyped ways. The latter, however, becomes almost academic by having the principal figures in the centre, and following a pyramidal arrangement. M. MUNKACSY adopts the bold expedient of placing the three crosses on which the SAVIOUR and the thieves are hanging at the side of the picture, and thus he makes them the end of a long line of people. But whatever merit may have been in the idea, it has not been carried out effectually. There is nothing in the arrangement which leads the spectators' thoughts to what should have been the principal figure. The Jews are departing, and have turned their backs to the agony that is visible on the cross. It would have been easy to have made the desolation of the scene become impressive if the Jews had been shown descending the hill, at more or less distance from the place of execution; but as every figure is painted on the same scale and is placed on the same plane, there is no gradation. We have simply several people moving in one direction, while three women and a man remain at the foot of one of the crosses. There is no space between the figures, which in fact form so united a crowd that their interests in the scene cannot be contrasted. Constructive skill is so ignored, that if the history of the scene were not known it might be imagined that the principal figure was the brutal ABHORSON, who stands with his ladder in a diagonal position, as if he were proud of his office of executioner; or the JUDAS, whose terror is of so melodramatic a kind; or one of the rabbis who are discussing the event. The painter's intention apparently is to suggest the degradation of the punishment by showing how people could regard it with indifference, and would not even wait for the death of the criminals when there was a possibility of a heavy shower of rain. But there is so much commotion that this intention has not been achieved. The picture would become more impressive if it were cut in two; the part showing the crucifixion would then be sufficiently complete.

Every one of the figures considered separately is most vigorously modelled, and the agony of the SAVIOUR is rendered with much pathos. If placed in a church, the painting could hardly fail to secure interest; but we doubt if it will sustain the test of an exhibition-room as well as M. MUNKACSY's *Christ before Pilate*, although in some points it shows that the painter has improved. That so many pictures of religious subjects should now be found within a short distance, is suggestive of a breaking-down of the obstacles which kept us in England from attempting the noblest form of art.

**Kingsbury Church** is to be enlarged and restored, according to plans prepared by Mr. Newman. It will form the centre of a new ecclesiastical district to be formed out of the parishes of Willesden and Neasden.
